Of the total training opportunities in day-trade and cooperative classes shown in Table VI, over 85 per cent may be expected to occur in five occupational groups. These are: automobile mechanic and repairman, machinist, millwright, and tool and diemaker, electrician, printing crafts, and, carpenter.

Six occupational groups, boilermaker, molder, painter, paperhanger and glazier, plasterer and cement finisher, plumber and pipefitter, and structural metal worker, are each expected to account for less than one per cent of the total training opportunities in the selected day-trade and cooperative education classes.

Number Entering Skilled Occupations From Day-Trade and Cooperative Classes

Unfortunately, not all those students who are enrolled in pre-employment vocational classes either complete their training or enter the job for which they were trained after completing the training program. The number of trainees who eventually enter the occupation for which they were trained is reduced from the

---

[4]The training program lengths were computed by dividing the total number of years spent in the training programs by the total number of students enrolled in them. Data were taken from *Day-Trade Teacher's Daily Program, Form 16* and *Cooperative Teacher's Daily Program, Form 16A,* submitted to the Missouri State Department of Education by the above schools in the years 1960-61 and 1961-62.

TABLE VI-TOTAL ENROLLMENT AND TRAINING OPPORTUNITIES BY OCCUPATION, IN SELECTED DAY-TRADE AND COOPERATIVE CLASSES PROJECTED THROUGH 1970

Occupation	1960-1965		1965-1970	
	Total Enrollment	Training Opportunities	Total Enrollment	Training Opportunities
Mechanic and repairman, automobile	3,855	2,763	3,705	2,656
Machinist, millwright, and tool and diemaker	2,699	1,934	2,594	1,859
Electrician	1,007	721	968	693
Printing craftsman (including compositor and typesetter)	1,006	721	966	693
Carpenter	817	586	785	563
Tinsmith, coppersmith, and sheet metal worker	758	543	729	522
Cabinetmaker and patternmaker	434	311	417	299
Mason	146	105	140	100
Boilermaker	79	57	76	55
Painter, paperhanger and glazier	44	31	42	30
Plumber and pipefitter	37	26	36	25
Plasterer and cement finisher	8	5	7	5
Molder	3	2	3	2
Structural metal worker	2	2	2	2
Total	10,895	7,807	10,470	7,504

total enrollment chiefly by two factors, (1) either the student drops out of school before graduation and therefore does not complete the training program, or, (2) if training is completed, the trainees simply do not enter the occupation for which they are trained. As shown in Table VII, the total number of persons expected to enter the various skilled industrial occupations from day-trade and cooperative education classes is estimated to be 8,233 for the 1960-1970 decade. Of this number, over 60 per cent are expected to enter one of two occupational groups, automobile mechanic and repairman, 2,914; and machinist, millwright and tool and diemaker, 2,039. By contrast, six other occupational groups are expected to employ only 1.6 per cent of the total number entering skilled occupations from those day-trade and cooperative education classes included in the study.

Total Registered and Non-Registered Apprentices

The total number of registered apprentices in the State was the parameter used to project apprentice training opportunities. The annual number of registered apprentices is expected to increase from 3,147 in 1960 to 4,453 in 1970. This change represents a yearly average increase of 4.51 per cent.

The number of non-registered apprentices included in the study was assumed to be approximately equal to the number of registered apprentices in the State.

TABLE VII-NUMBERS EXPECTED TO COMPLETE TRAINING AND ENTER THE SELECTED SKILLED OCCUPATIONS DURING THE 1960-1970 DECADE

Occupation	Expected Training Completions	Expected Occupational Entries*
Mechanic and repairman, automobile	4,676	2,914
Machinist, millwright, and tool and diemaker	3,273	2,039
Electrician	1,221	761
Printing craftsmen (including compositor and typesetter)	1,220	759
Carpenter	991	617
Tinsmith, coppersmith, and sheet metal worker	919	564
Cabinetmaker and patternmaker	525	328
Mason	177	111
Boilermaker	97	60
Painter, paperhanger, and glazier	53	33
Plumber and pipefitter	45	28
Plasterer and cement finisher	10	6
Molder, metal	4	2
Structural metal worker	2	1
Total	13,213	8,233

*Computed as 62.3 per cent of the expected training completions.

This assumption was based on an estimate made by the United States Office of Education[5] and was used because no other indicator of the number of non-registered apprentices in the State was available.

Total Apprentice Training Opportunities

The total number of training opportunities for all apprentices in the State is expected to be 19,058 for the decade. The number of training opportunities for those apprentices included in the study is expected to be 16,261.

As shown in Table VIII, the occupational group expected to have the largest number of apprentice training opportunities during the decade is carpentry with 4,018. Substantially below this, the second and third largest number of apprentice training opportunities is expected in the plumber and pipefitter, and tinsmith, coppersmith and sheet metal worker occupational groups with 2,120 and 1,749, respectively.

---

[5]U. S. Office of Education, *Vocational Education in the Next Decade,* (Government Printing Office, Washington, D. C., 1961), p. 63.

TABLE VIII-APPRENTICE TRAINING OPPORTUNITIES IN SELECTED SKILLED OCCUPATIONS DURING THE 1960-1970 DECADE

Occupation	Training Opportunities
Carpenter	4,018
Plumber and pipefitter	2,120
Tinsmith, coppersmith and sheet metal worker	1,749
Painter, paperhanger and glazier	1,558
Machinist, millwright and tool and diemaker	1,411
Electrician	1,393
Mechanic and repairman, automobile	1,116
Cabinetmaker and patternmaker	417
Plasterer and cement finisher	396
Mason	297
Molder, metal	117
All "other" apprentices	2,797
Total	19,058

Total Skilled Worker Training Opportunities

The total number of training opportunities for the skilled workers included in the study, during the 1960-1970 decade, is estimated to be 31,572, of which 16,261 or approximately 52 per cent, are expected to be in apprentice training programs and about 48 per cent in the day-trade and cooperative education classes.

A comparison of the expected training opportunities, training completions, and trained occupational entries during the coming decade is shown in Figure 3. This figure illustrates the erosion which occurs in the various skilled worker training programs. The unshaded section of the figure indicates the total number of training opportunities in day trade, cooperative education, and apprentice training programs included in the study which are expected to become available during the decade. The light shaded section indicates the number of trainees who are expected to complete their training but *do not* enter the occupation for which they were trained. The black section of the bar indicates the number of trainees who may be expected to seek employment in the occupation for which they are trained.

While the erosion in each of the occupational groups shown in the figure presents a serious problem for those in charge of the various vocational training programs throughout the State, the problem, unless corrected, will probably become especially serious in the automobile mechanic and repairman, machinist, millwright and tool and diemaker, and carpenter occupations in light of the critical shortage of trained workers already existing in these occupations as pointed out by the United States Department of Labor.

FIGURE 3

COMPARISON OF THE EXPECTED NUMBER OF TRAINING OPPORTUNITIES, TRAINING COMPLETIONS, AND OCCUPATIONAL ENTRIES DURING THE 1960-1970 DECADE

The Imbalance Between Employment And Training Opportunities

An estimate of the imbalance between employment and training opportunities may be made simply by subtracting one from the other. However, this would result in an under estimate of the imbalance, for not all those enrolled in training programs complete their training and many who complete the training do not enter the occupation for which they are trained. Therefore, the *expected* imbalance, indicated in Table IX, includes a correction for training program drop-outs and occupational non-entries. As revealed in the table, most occupational groups are expected to have too few training opportunities and occupational entries. By far the greatest shortage during the decade is expected to occur in the automobile mechanic and repairman category, 15,790. By comparison, the second largest shortage is expected to be carpenters, 8,945. On the other hand, six occupational groups are expected to have a surplus of new workers seeking employment if past training and employment trends continue.

The imbalance between employment and training opportunities may also be illustrated as a ratio. These are presented in Table X. The most serious shortage of trained workers is expected to be in the automobile mechanic and repairman occupations with 5.2 employment opportunities for each trained worker seeking employment. Conversely, the most serious over-supply of trained workers during the decade, if present training trends continue, may be expected in the painter, paperhanger and glazier occupations with about 3.5 trained workers for each employment opportunity in these occupations.

The Training Job To Be Done

An illustration of the overall training job to be done is presented in Figure 4. If all those who are expected to be enrolled in the various training programs should complete their training *and* enter the occupation for which they are trained, only about 62 per cent of the total demand would be met. However, when a correction is made for the number of trainees expected to drop out of the training programs and the number of training program graduates not expected to enter the occupation, it is estimated that only about 39 per cent of the available jobs will be filled by workers from day-trade, cooperative education, and apprentice training programs.

The changes required to bring the supply of trained workers closer into balance with the expected demand are shown in Table XI. The estimates presented in the table are based on the assumption that the percentage of trained workers not entering the occupation for which they are trained will remain at past levels. Of course, to the extent that efforts to increase the numbers of trainees entering skilled industrial occupations are successful, these estimates will be reduced.

The greatest increases needed in the training facilities throughout the State are in the automobile mechanic and repairman and carpenter occupational groups. On the other hand, the training facilities in four occupational groups may need to be reduced. In the tinsmith, coppersmith and sheet metal worker occupations

TABLE IX-EXPECTED IMBALANCE BETWEEN EMPLOYMENT OPPORTUNITIES AND TRAINING OPPORTUNITIES DURING THE 1960-1970 DECADE

Occupation	Employment Opportunities	Training Opportunities	Apparent Imbalance*	Expected Occupational Entries	Expected Imbalance**
Mechanic and repairman, automobile	19,498	6,535	-12,963	3,708	-15,790
Carpenter	12,420	5,167	- 7,253	3,475	- 8,945
Machinist, millwright and tool and diemaker	5,927	5,204	- 723	3,042	- 2,885
Plumber and pipefitter	4,002	2,171	- 1,831	1,535	- 2,467
Electrician	4,069	2,807	- 1,262	1,752	- 2,317
Mason	1,179	499	- 680	311	- 868
Plasterer and cement finisher	848	406	- 442	287	- 561
Structural metal worker	849	703	- 146	497	- 352
Cabinetmaker and patternmaker	795	1,027	+ 232	625	- 170
Boilermaker	68	112	+ 44	60	- 8

Tinsmith, coppersmith and sheet metal worker	552	2,814	+ 2,262	1,807	+ 1,255
Total	50,521	31,572		19,786	

*Indicates difference between training opportunities and employment opportunities. Plus figures denote an over-supply of training opportunities; minus, an under-supply.

**Indicates difference between expected occupational entries and employment opportunities. Negative figures denote an under-supply of trained workers. Positive figures indicate an expected over-supply.

TABLE X-RATIO OF EMPLOYMENT OPPORTUNITIES TO TRAINING OPPORTUNITIES AND EXPECTED OCCUPATIONAL ENTRIES

Occupation	Training Opportunities		Expected Entries	
	(1)* Under Supply	(2) Over Supply	(3) Under Supply	(4) Over Supply
Mechanic and repairman, automobile	2.9		5.2	
Mason	2.4		3.8	
Carpenter	2.4		3.6	
Plasterer and cement finisher	2.0		2.9	
Plumber and pipefitter	1.7		2.6	
Electrician	1.4		2.3	
Structural metal worker	1.2		1.7	
Machinist, millwright and tool and die maker	1.1		1.6	
Cabinetmaker and patternmaker		1.3	1.3	
Boilermaker		1.6	1.1	
Printing craftsman, including compositor and typesetter		3.6		2.2
Tinsmith, coppersmith and sheet metal worker		5.0		3.2
Painter, paperhanger and glazier		6.4		3.5
Blacksmith, forgeman and hammerman	No expected training and/or employment opportunities during the decade			
Molder, metal				
Stationary engineer				

*Column figures indicate:

(1) Number of employment opportunities for each training opportunity.
(2) Number of training opportunities for each employment opportunity.
(3) Number of employment opportunities for each trained worker seeking employment.
(4) Number of trained workers seeking employment for each employment opportunity.

an annual reduction of trained workers of about 7 per cent will probably be required to bring the supply into balance with the demand.

Conclusions

Within the limits of the accuracy of the estimates made in this study, the following conclusions may be drawn relative to the projected employment and training opportunities and the imbalances between the supply and demand for skilled industrial workers in Missouri.

Since the employment of skilled workers as a whole is expected to increase in nearly all of the non-agricultural industries in the State during the coming decade, skilled industrial workers can look forward to a continuing high level of

FIGURE 4

COMPARISON OF TOTAL EMPLOYMENT OPPORTUNITIES, TRAINING OPPORTUNITIES AND EXPECTED OCCUPATIONAL ENTRIES DURING THE 1960-1970 DECADE EXPRESSED AS A PER CENT

TABLE XI-CHANGES NEEDED IN SKILLED INDUSTRIAL WORKER TRAINING PROGRAMS IN MISSOURI DURING THE 1960-1970 DECADE

Occupation	Change in Number of Trainees Required		Annual Per Cent Change Required*	
	Increase	Decrease	Increase	Decrease
Mechanic and repairman, automobile	15,790		42.6	
Carpenter	8,945		25.7	
Machinist, millwright and tool and diemaker	2,885		9.5	
Plumber and pipefitter	2,467		16.0	
Electrician	2,317		13.2	
Mason	868		27.8	
Plasterer and cement finisher	561		19.5	
Structural metal worker	352		7.0	
Cabinetmaker and patternmaker	170		2.7	
Boilermaker	8		1.3	
Molder, metal		167		19.4
Printing craftsman, including compositor and typesetter		793		5.5
Painter, paperhanger and glazier		889		7.8
Tinsmith, coppersmith and sheet metal worker		1,255		6.9

*Computed by dividing the change in workers required by the number expected to enter the occupation.

employment. More specifically, the outlook appears to be especially good for automobile mechanics and repairmen, machinists, millwrights and tool and diemakers, carpenters, plumbers and pipefitters, and electricians, due to the relatively large employment opportunities expected during the decade.

On the other hand, unless serious attention is given to the demand for skilled workers by those in charge of training facilities throughout the State, an over-supply of trained workers may be expected in the printing crafts, tinsmith, coppersmith and sheet metal crafts, and in the painter, paperhanger and glazier occupational groups.

Despite a general increasing demand for skilled industrial workers in the State, if present trends continue, training facilities for such workers in secondary schools may be expected to increase at only about one-third the rate of new skilled employment demands. However, it should be noted that the recent passage of the "Manpower Development and Training Act," the "Area Redevelopment Act," and Title VIII of the "National Defense Education Act" on the national level, and the "Junior College Act of Missouri" on the State level may have a marked effect on these training trends.

In as much as the number of expected employment opportunities for skilled industrial workers is more than twice as great as the number of trained workers that may be expected to enter these occupations during the decade, it is apparent that many skilled worker training programs will need to be expanded or ad-

ditional ones established. This large imbalance, unless corrected, will probably result in a serious shortage of trained workers in the automobile mechanic and repairman, mason, carpenter, plasterer and cement finisher, plumber and pipefitter, electrician, structural metal worker and, machinist, millwright and tool and diemaker occupational groups.

Implications

In view of the findings and conclusions of this study, the following implications seem apparent:

Closer cooperation should be established between all agencies responsible for the guidance and training of skilled industrial workers, to the end that the supply of these workers may be brought into closer balance with the demand.

Because a surplus of trained workers may be expected in certain skilled industrial occupations, if present trends continue, the public secondary schools of the State should carefully examine the number of workers they are training in relation to the demand. Obviously, public secondary schools should not continue to provide vocational training in those occupations for which there is no demand or for which the demand is being met by other training agencies.

Although this study points out the possible over or under-supply of labor in certain skilled industrial occupations, expansion on contraction of any particular training facility must be based on a careful study of local and State-wide employment conditions. The findings of this study should be helpful to this end.

Administrators of skilled industrial worker training programs and vocational counselors should pay particular attention to the trends in skilled employment within the various industry groups. For example, the mining industry, while employing relatively few skilled workers at the present time, is increasing its proportion of skilled industrial workers very rapidly. This changing employment pattern, when viewed in light of the great potential growth of the iron mining industry in Missouri, takes on an added significance.

Finally, while the responsibility for vocational guidance in the past has been left largely to the secondary schools of the State, it seems obvious that unless a serious attempt is made to reduce the erosion which takes place in skilled industrial worker training programs, this responsibility may be lost by default. Therefore, school administrators, counselors, vocational educators, labor organizations and employers should recognize the importance of skilled workers to the economy of the State. If the problem is to be met, these groups must *systematically* seek out those students who may best profit from the training, encourage them, in appropriate numbers, to enroll in the training programs, complete their training and then enter the occupation for which they are trained. Some compromises may be necessary on the part of employers and labor unions in order to facilitate the employment of newly trained workers.

*COOPERATIVE EDUCATION; *GUIDELINES; *COORDINATORS; *ADMINISTRATIVE PERSONNEL; HIGH SCHOOLS; PROGRAM PLANNING; *TRADE AND INDUSTRIAL EDUCATION; PROGRAM DEVELOPMENT; PROGRAM COORDINATION; STATE STANDARDS
ILLINOIS

Industrial cooperative training programs provide high school students with training in an industrial, trade, or service occupation. It requires one or two years of part-time, out-of-school, on-the-job employment training supplemented by in-school related instruction. This bulletin is intended to assist school administrators and teacher-coordinators in establishing and maintaining such programs. A large part of the responsibility for the success of a cooperative training program rests with the school administrator but the optimum effectiveness of the program is primarily dependent upon the coordinator. The various guidelines provide these individuals with material on their respective duties and responsibilities. Guidelines are also provided on the selection and placement of student-learners, the related instruction phase of the program, and the organization and function of advisory committees. The establishment, arrangement, operation, and functioning of program coordination is necessary to assume that the student-learner is acquiring a complete and well-rounded series of manipulative skills, is making normal progression, and is being supplemented by general and technical information needed for a competent and well-trained worker. Other aids for the coordinator include such items as grades and grading, wage-hour exemption, working permits, and the necessary report and record forms. (HC)

PREFACE

Industrial Cooperative Education is a program of vocational education designed to provide more opportunities for youth to receive training in an occupation of his or her choice by cooperatively utilizing the resources of the community and school. This bulletin is intended to assist school administrators and teacher-coordinators in establishing and maintaining such programs. No attempt has been made to solve all problems or answer all questions which arise in the operation of the program.

In Illinois, industrial cooperative education has had a steady growth. It is apparent that this type of program has a place in both large and small communities in providing Vocational Education for youth in secondary schools.

The Trade and Industrial Education Service of the Vocational and Technical Education Division desires to assist, wherever possible, in the organization and development of Industrial Cooperative Education programs.

Eurus Stoltz, Chief
Trade and Industrial Education

FOREWORD

During the past several years, growth in Industrial Cooperative Education programs in the United States has attempted to keep pace with the Nation's employment requirements. Statistics indicate a vast number of job vacancies, while at the same time revealing the existence of a large number of unemployed persons lacking skills. The answer is obviously TRAINING. Industrial cooperative education has demonstrated its effectiveness in preparing high school youth for entry into the "World of Work."

Much of the material in this bulletin is not new. We have attempted to compile and report the basic philosophy, activities, methods and operational procedures involved in cooperative programs, which we and others, have found to be successful.

CHAPTER I

THE PART-TIME INDUSTRIAL COOPERATIVE TRAINING PROGRAM

A. Description of an Industrial Cooperative Training Program

Industrial Cooperative Training is the name applied to a recently developed program of Trade and Industrial Education. It is the outgrowth of the Part-Time Continuation program established under provisions of the original Smith-Hughes Act of 1917. It is designed to use the resources of the community and the school to prepare boys and girls for employment on the basis of an organized program of vocational training. It is, in a sense, a revised version--based on sound and proven teaching principles--of the traditional form of vocational training known as "apprenticeship." In fact, it is often thought of as "pre-apprenticeship training."

Since its beginning in 1947, industrial cooperative education in Illinois has been limited to the two-year Trade and Industrial Education program, commonly known as Diversified Occupations or "D.O." With the implementation of the "Vocational Education Act of 1963," the State of Illinois has broadened its offerings in the area of industrial cooperative education. Guidelines have been determined for two such types of cooperative education. These are: (a) One and Two-Year D.O. programs, and (b) Supervised Job Training. Because both types pertain to cooperative education in the trade and industrial field, this manual will hereafter refer to them as "Industrial Cooperative Training."

Industrial Cooperative Training programs provide training for boys and girls in the industrial, trade or service occupation of their choice. It requires one or two years of part-time, out-of-school, on-the-job employment for which being trained, supplemented by in-school related instruction.

Students enrolled in the program are referred to as "student-learners." The student-learner is in training at a service establishment or industry one-half of each school day for a minimum of fifteen (15) hours per week. The student also attends school one half of each school day to take high school subjects required for graduation, including one or two periods per day for instruction related to the occupation being learned.

The program of instruction must have been developed and must be conducted in consultation with potential employers, employees, or groups of employers and employees having skills in and substantive knowledge of the job or occupational field represented by the course objective.

The program of instruction should combine and coordinate the in-school related instruction with field, shop, laboratory, cooperative work or other occupational experience which is

appropriate to the vocational objective of the students. It should be of sufficient duration to develop competencies necessary to fit him or her for employment in the job or occupational field for which training is given. The arrangement also provides for: (a) the employment of student-learners in conformity with Federal, State, and local laws and regulations, and in a manner not resulting in exploitation of such student-learners for private gain, (b) an organized program of training on the job, and (c) supplemental vocational instruction in school.

The program thus brings together the employer -- commonly known as the "training station" -- and the school, in an effort to train boys and girls to become skilled wage-earners upon completion of high school. The program is supervised, directed, or coordinated by a person qualified under the State Plan for vocational education. This person is known as the "teacher-coordinator."

While several different occupations may be included in a local industrial cooperative education program, each individual student-learner receives on-the-job experiences and in-school related instruction in only one. The variety and the number of different occupations represented by a given class will vary from year-to-year depending upon the occupational interests of the students and the availability of suitable training stations.

B. Types of Industrial Cooperative Training Programs

1. Two-Year Program

As indicated earlier, industrial cooperative training is organized, basically, as a two-year program. It incorporates manipulative and other skills which are taught on-the-job, supplemented by appropriate related instruction which, in combination, will produce competent and knowledgeable workers.

The two-year program is designed for those high school students who have attained the legal employment age (16 years) and who are classified as either juniors or seniors. It also serves those former dropouts who have reentered school to complete the requirements for a diploma and to acquire some basic saleable skills.

To provide for continuity of employment, as well as to increase the available time for instruction, more and more programs are being extended so as to operate during the summer months. Under this arrangement, those training stations which employ students during their junior year may continue training on-the-job without interruption. The related instruction in school likewise continues. Usually, the length of time

devoted to related instruction, as well as that spent on-the job, are increased during summer sessions because the student does not pursue any other high school courses.

In accordance with the State Plan, industrial cooperative classes must operate a minimum of nine (9) months, or thirty-six (36) weeks per year. The minimum weekly time requirements for cooperative classes composed of secondary and special students shall be as follows:

a. On-the-job training -- A minimum of fifteen (15) hours per week, not less than half of which must be during the regularly scheduled school day, or during added time when the teacher-coordinator is assigned the responsibility for supervision.

b. Related Instruction -- Two hundred (200) minutes per week of group instruction by the teacher-coordinator.

Federal regulations prescribe that student-learners may not exceed a total of forty (40) hours per week in school and on the job.

2. One-Year Program

The one-year program is designed for and especially adapted to the larger high school, and for those senior students who for some reason were unable to enroll in the conventional two-year program. In some instances, prospective students and their parents do not become aware of the excellent potentialities of the program until such students are about to enter their senior year. Others, who have previously pursued an academic program with a college objective, finally decide that their interests and talents do not lie in that direction. They, too, then look toward other high school courses having career objectives. Industrial cooperative training is one of these. The one-year program may also serve the needs of young adults who return to high school for evening courses offering credit toward a diploma.

Student-learners in this program must meet all of the minimum time requirements outlined for the two-year program and must, in addition, either have had previous experience in the occupational field, or previous class instruction related to the occupational field, or be enrolled for two hundred seventy-five (275) minutes per week of instruction in a concurrent class related to the occupation field, or be enrolled for four hundred (400) minutes per week of group

related instruction and taught by the teacher-coordinator.

It is possible for senior students who intend to enter the program for the first time in the fall to enroll in the preceding summer session. Student-learners, as outlined above under the two-year program, could thus begin both their on-the-job training and related instruction and thereby gain the equivalent of an additional semester's work. All training given must be through a logical step-by-step progression of job experiences and related instruction which will provide all-round experience in all phases of the occupation. Excessive participation or over-specialization in a single restricted phase of work is to be avoided.

C. Occupations For Which Training May Be Given

As mentioned earlier, training may be given for practically any trade, industrial, or service occupation in the skilled or semi-skilled category having a recognized learning period of one or more years of on-the-job training. As many different occupations may be represented within a group of student-learners as there are students in the class. No occupations are included in the program which do not provide good training and opportunity for continued employment without displacement of regular workers. A partial listing of occupations suitable for industrial cooperative training programs includes:

Automobile Body Repairman
Automobile Upholsterer

Baker
Beauty Operator
Bicycle Repairman
Blockmaker - Concrete
Boilermaker
Bookbinder
Brick Mason
Butcher

Cabinetmaker
Candymaker
Carpenter
Carpet Layer
Cement Finisher
Chef
Commercial Artist
Commercial Cook
Compositor
Coremaker
Custodian

Dairy Processor
Dental Assistant
Dietitian
Draftsman
Dress Designer
Dressmaker
Dry Cleaner

Electrical Appliance Repairman
Electrician - Auto
Electrician - General
Engraver

Floral Designer
Florist
Foundryman
Furniture Repairman

Glass Blower
Glazier
Greenhouse Worker

Heat Treater

Highway Engineering Assistant
Hotel-Motel Maintenance Man
Housekeeper - Institutional

Interior Decorator

Jewelry Repairman

Lab Assistant --
  BioChemistry
  Chemical
  Dairy
  Industrial
  Medical
Lens Grinder
Librarian Assistant
Linoleum Layer
Linotype Operator
Locksmith
Lumberyard Worker

Machinist - Automotive
Mattress Maker
Mechanic --
  Air Compressor
  Aircraft Engine
  Automatic Pin Spotter
  Automobile
  Cash Register
  Computer
  Diesel
  Farm Equipment
  Heating & Ventilating
  Instrument
  Marine
  Motorcycle
  Office Machines
  Tractor
  Typewriter
Meat Cutter
Medical Records Assistant
Medical Service Occupations
Meter Repairman
Millwright
Molder
Mold Maker
Mortician Assistant
Mosaic Tile Setter
Motion Picture Projectionist
Multigraph Operator

Needle Trades Worker
News Dispatcher
Newspaper Reporter

Nurseryman

Ornamental Iron Worker
Orthopedic Shoe Fitter

Painter and Decorator
Paperhanger
Patternmaker
Photo Engraver
Photographer --
  Portrait
  Surgical
Physical Therapist
Pipefitter
Plastics Worker
Plumber
Poultry Processor
Power Plant Operator
Printer --
  Compositor
  Letterpress
  Offset
Production Inspector
Proof Reader

Radio & TV Announcer

Sawmill Operator
Seamstress
Sheet Metal Worker
Shoe Repairman
Sign Painter
Stone Cutter
Structural Steel Layout Man
Surveyor
Switchman

Tailor
Taxidermist
Telephone Repairman
Tile Setter
Tire Rebuilder
Tool & Die Maker

Upholsterer

Warehouse Worker
Watch Repairman
Welder
Welldriller
Window Decorator

X-Ray Lab Assistant

This list is neither complete nor is it applicable to every community having a program. Many other occupations providing good training opportunities may be added. A community survey will indicate those occupations for which training is needed and should be given.

D. Supervised Job Training Program

Another more recently established type of industrial cooperative education has been designated as Supervised Job Training. The primary purpose of this program is to assist the schools in exploring one possible solution to the problem of:

(a) present and potential dropouts, and

(b) students in the regular high school program who are classified as low academic achievers.

Supervised Job Training is intended for those low academic achievers who are still in school and who have been identified as potential dropouts. It is also intended for those students who have already dropped out of school and who may be encouraged to return to prepare themselves for entry into the labor market.

Prior to establishing such a program the cooperating school shall prepare a proposal or plan of operation. The proposal shall be based upon and include reference to the minimum requirements outlined below. It shall be submitted for approval by the State Office.

Requirements:

1. Age: Student-learners shall be sixteen (16) years of age or over.

2. Academic pre-requisites: No grade level requirements.

3. On-the-job training: Student-learners shall be employed a minimum of fifteen (15) clock hours per week over a period of one (1) year.

4. Wages: While students are in training on-the-job they shall receive a wage comparable to that of other beginners in the occupation and conforming to any State or Federal regulations applying thereto.

5. School attendance: One-half of each day in school. All student-learners must receive a minimum of two hundred (200) minutes per week of group instruction in a class related to their employment. The remainder of the in-school time shall be devoted to the subjects which will upgrade their civic, social, and vocational intelligence. The total time in school and time on the job must not exceed forty (40) hours per week.

6. Subsequent credits: Credit allowed, if any, shall be at the discretion of the local school authorities.

7. Occupations: Training shall be in trade and industrial semi-skilled and service occupations.

8. Reimbursement: The prevailing reimbursement policies shall apply to the salaries paid coordinators. This will take into account the coordinator's schedule of related instruction and coordination.

9. Coordinator's qualifications: Shall be identical with those of an Industrial Cooperative Education (D.O.) Coordinator.

10. Schedule of Work and Related Instruction: A written schedule of the specific on-the job skills to be taught and the related instruction presented in the school shall be prepared prior to the approval of the program.

11. Local Advisory Committee: The local school's plan of operation must provide for the appointment and functioning of a local advisory committee who shall meet at intervals to advise school authorities regarding program development.

Occupations for Which Training May Be Given

The semi or single-skill occupations which follow are indicative of jobs which can be filled by students enrolled in the Supervised Job Training program. Additional suitable jobs may be added to this list.

Assembler
Bench Hand
Bus Boy
Car Hop
Car Washer and Polisher
Clothes Presser
Cook's Helper
Custodian
Delivery Man
Dietetic Aide
Feed Mill Worker
Florist's Helper
Fry Cook
Gardener
Gas Station Attendant
Hand and Machine Sewer
Home Maintenance Worker
Hospital or Nursing Home Aide
Hotel or Motel Maid
Housekeeper
Machine Operator
Meter Reader
Nursery Worker
Porter
Produce Man
Salad and Sandwich Girl
Solderer
Steam Table Attendant
Stock Boy
Tire and Battery Man
Tree Trimmer
Waitress
Warehouse Helper

Suggested Proposal for Supervised Job Training

The sample which follows is indicative of a satisfactory form of proposal from a local school district which intends to establish a Supervised Job Training program.

Proposal

for

Supervised Job Training Programs

Board of Education

City of _____

Statement

Development of a vocational program for the 16 year old underachiever and potential dropout to assist him in reaching satisfying personal and economic goals is an essential part of any adequate vocational program.

A request is hereby submitted for approval to participate in the Supervised Job Training Program in the following school: _____

_____

The program is intended for low academic-achievers who are 16 years of age or over and still in school. They have previously been identified as potential dropouts who lack needed skills for entry into the labor market.

The Supervised Job Training program is to be conducted cooperatively with the Illinois State Board of Vocational Education and Rehabilitation.

General Objectives

1. To provide the students through a cooperative work program with skills.

2. To provide the student with related theory based on a job analysis of the occupational area in which he is employed and provide courses to further strengthen his skills in communication.

3. To assist the student through additional work-related guidance and counseling to develop the ability, attitudes and knowledge for successful adjustment as a worker, as a citizen, and as a member of the family.

4. To provide and continue a follow-up study of students in the program after leaving school. This service is intended to strengthen the existing guidance service and to assist in evaluation of the effectiveness of the training provided.

The following items are included in this proposal:

1. Age: Students shall be 16 years of age or over and less than average academic-achievers.

2. Academic prerequisites: No grade level requirements.

3. On-the-job training: Limited to one half day for a minimum of fifteen (15) hours per week for nine (9) months.

4. Wages: Students who are in training on the job shall receive a wage which conforms to any State or Federal regulations and which is comparable to that paid other beginners in the occupation.

5. School attendance: One-half of each day in school. School time will be devoted to subjects which will upgrade the student's general educational background and in subjects related to the student's employment. The student will spend one period each day for related instruction by the coordinator of the program. Related instruction will be such as to strengthen the student's knowledge in his role as worker and citizen. This instruction will also provide him with the technical information required by the job for which he is training.

6. Subsequent credits: Credit allowed, if any, shall be at the discretion of the local school authorities.

7. Occupations: Training is in semi-skilled and service occupations.

8. Coordinator's qualifications: Shall be identical with those of an Industrial Cooperative Education (D.O.) Coordinator.

9. Written schedule of work and related instruction: A written schedule of the specific functions to be learned on the job and the related instruction involved shall be prepared prior to the placement of any student in the program.

10. Local Advisory Committee: The appointment and functioning of a local advisory committee to consult with local school authorities regarding program development shall be effected.

11. Certificate: Upon successful completion of the one-year Supervised Job Training program the student will be granted a certificate and be encouraged to continue his educational program in the evening school.

_____ _____

Date Superintendent

E. Industrial Cooperative Education vs. Work Experience

The chart which follows is intended to outline a comparison of the major objectives, essential characteristics and role of participants in two types of programs involving part-time employment for in-school youth.

Industrial Coop. Education	vs. Work Experience
Objectives: Training for employment Retention in school	Objectives: Job placement Rehabilitation
For Whom: Student-learner	For Whom: Student-worker
Where: A training station	Where: A job (often "blind alley")
By Whom: An employer-trainer	By Whom: A boss
Learning Opportunities: Preparation for an occupation	Learning Opportunities: Little or no occupational preparation
Employment Supervision: Provides for employment supervision in student-learner's training plan.	Job Supervision: Little or no on-the-job supervision
Training Personnel: Qualified teacher-coordinator	Training Personnel: Untrained person in charge No supervision from school
Related Instruction: Provision for related classroom instruction	Related Instruction: No related classroom instruction
Wages: Progressively increasing learners wages are paid. Wages and hours subject to Federal and State regulations.	Wages: Nominal or no wages paid may lead to exploitation of students

From the foregoing, it will be noted that the Industrial Cooperative Education (D.O.) and the Supervised Job Training programs involve specific job training. Work Experience programs on the other hand include little, if any, organized instruction.

To assure that good training results and that the student-learner is not exploited, certain basic standards have been established for cooperative programs. The following criteria entitled, "Credit for Vocational Experiences," are set forth in a publication of the Office of the State Superintendent of Public Instruction entitled, "Evaluation, Supervision and Recognition of Schools," Circular Series A - No. 160 (1964), pages 21-22.

"A high school may give one unit of credit per year, not to exceed two successive years for out-of-school work experience, provided such credit is given in combination with equivalent credit given for in-school instruction which is directly related to the out-of-school work experiences. The work program is governed by the following standards:

1. Objectives of the program shall be clearly set forth in written or printed form.
2. The teacher-coordinator of the program shall be qualified in the field in which he is teaching. His qualifications shall include technical training and practical experience in the field and professional training in the operation of programs involving the cooperation of the school and the community.
3. Only pupils of employable age are eligible to participate in the program.
4. Adequate classroom facilities, equipment and reference materials are to be available.
5. Each pupil is to be paid a monetary wage comparable to that paid other learners in the program.
6. Information about each pupil necessary for the teacher-coordinator to secure placement for the pupil in accordance with his abilities shall be available.
7. Criteria by which occupations are selected should be clearly set forth in written or printed form.
8. Definite agreement as to the responsibility of the school and the establishment employing the pupil is to be determined in advance of the training program. This agreement should be put in proper form and carry the signatures of the responsible official of the school and the employer.
9. The classroom teacher correlates classroom learning with experiences on the job.
10. Each pupil is given a written or printed outline of his job learning experiences.
11. The pupil's grades are determined by accomplishments in the classroom and on the job.

12. The classroom teacher supervises the job activities through organized visits to the pupil's place of employment and through consultation with the employer.
13. The program is conducted in compliance with all laws affecting the employment of minors.
14. It is recommended that a lay consultant committee be selected to advise with the school in various aspects of the program."

F. Advantages of Industrial Cooperative Training Programs

Numerous advantages characterize the two types of programs of industrial cooperative training. The more basic of these are:

1. The relatively small cost of equipment and supplies necessary.
2. The wide variety of occupations for which training is possible.
3. The ability to gear the number of student-learners in training in a given occupation and at a given time to the employment opportunities available in industry.
4. The acquisition by student-learners of manipulative skills as practiced in actual job situations.

In addition to the foregoing, there are advantages which accrue to the benefit of the student-learner, to the employer-trainer, to the school, to the community and to labor.

1. Advantages to the student-learner are:

a. Offers an opportunity to receive some specific occupational training while attending high school.
b. Offers an opportunity to complete high school and receive the regular diploma.
c. Offers training for boys and girls in their chosen occupation in the local community.
d. Offers an organized plan of training on-the-job under actual industrial conditions.
e. Offers an opportunity to secure training at a relatively low cost.
f. Establishes definite work habits and attitudes.
g. Makes possible a satisfactory adjustment of work and employment.
h. Allows for correlation of school work and employment.
i. Lends encouragement to stay in school until graduation.
j. Offers an opportunity for employment in the local community after completing high school and the training program.
k. Enables students, in many cases, to secure full-time employment with the training agency after completing their courses and graduating from high school.
l. Motivates interest in other school subjects.

m. Develops a feeling of responsibility.
n. Provides instruction in safety and instills good occupational habits.
o. Enables the student to stay in school due to his earnings.
p. Enables the student to make an intelligent choice of his life's work earlier.

2. Advantages to the employer-trainer are:

a. Gives a better acquaintance with the prospective employees of the community.
b. Provides a source of better trained and more intelligent employees.
c. Enables the employer to have a part in the school program.
d. Permits other employees to become aware of their need for additional training.
e. Enables the employer to receive more direct returns from his school tax dollar.

3. Advantages to the school are:

a. Broadens the curriculum.
b. Helps hold students in school longer.
c. Allows the school to offer preparatory training for those who are entering an occupation.
d. Enables the school to better meet the training needs of the community.
e. Allows training in a number of occupations at the same time and at a comparatively low per capita cost.
f. Provides closer cooperation with the community as a whole.
g. Provides closer correlation with the job and the world of work.
h. Necessitates a relatively small amount of equipment.
i. Enables other employees to note their needs for more training.
j. Helps the establishment of supplementary training classes.
k. Permits flexibility of instruction in a given occupation, as it may readily be discontinued when the training needs of that occupation are met.

4. Advantages to the community are:

a. Encourages young people to remain in their home community after completing high school.
b. Encourages young people to remain in school and in the community.
c. Allows training in a number of occupations at the same time and at a comparatively low per capita cost.

d. Tends to produce citizens who will feel their community responsibility at an earlier age.
e. Gives increased buying power to its citizens earlier in life.
f. Promotes a closer cooperation between the community and the school.
g. Provides a closer correlation between the school and employment.
h. Enables youth to make better and quicker occupational adjustments.

5. Advantages to labor are:

a. The assurance that the labor market will not be flooded.
b. Enables labor to help guide the program through representation on the advisory committee.

CHAPTER II

ESTABLISHING AN INDUSTRIAL COOPERATIVE EDUCATION PROGRAM

A. Procedures to be Followed

1. Community Request

When a community arrives at the conclusion that an Industrial Cooperative Education program will meet a local training need, a representative of the State Board of Vocational Education and Rehabilitation should be contacted.

2. State Office Assistance

To arrive at a conclusion regarding the situation, the Trade and Industrial Education Service of the State Board needs certain definite information about the community and its schools. To this end, a representative of the Trade and Industrial Education Service will visit the school for a preliminary discussion. Occupational data from the last United States census and other available statistics are studied and local school authorities and community leaders are consulted. In other words, reasonable assurance that the program can succeed must be evident before it can be authorized.

During this visit or subsequently, a meeting of ten or twelve leading employer and employee representatives in the community is called. This provides an excellent opportunity to sample interest in the program. The representative of the State Board should be invited to explain the program to this group. The members of the group should also be encouraged to inform other employers and employees regarding the program.

3. Community Survey

The representative of the State Board of Vocational Education and Rehabilitation, when satisfied with the general situation, will propose a detailed survey. The survey is intended to explore the training possibilities within the community. Such information will be needed by the local teacher-coordinator to assist him in setting up the program. The survey is made by the local school authorities through contacts with employers in the community. The Industrial Cooperative Education program is explained to them. A definite statement concerning their willingness to cooperate by training student-learners from the high school on a part-time cooperative basis is obtained. Occupational and statistical information which is helpful in determining training needs is secured.

In all probability the person (interviewer) making the survey will be a prospective teacher-coordinator, a guidance counselor or an industrial education teacher from the school. To assure the most effective outcome from the survey, this person has the responsibility for certain specific activities. These may be stated as:

What the Interviewer Does

a. Prepare the questionnaire form
b. Secure the names of prospective employers (training stations)
c. Make the survey through personal visitations
d. Make a card file on prospective employers, including data for each
e. Tabulate the results
f. Write a report

What the Interviewer Needs to Know

a. Purposes of surveys
b. Types and techniques
c. Sources of information
d. How to summarize statistics
e. Interpretation of survey information
f. Filing

4. Objectives of the Survey

In conducting the survey, answers to several questions are sought. If the survey indicates that the community can successfully support an Industrial Cooperative Education program, it will show among other things:

a. That there is a sufficient turnover of labor to insure full-time jobs for all Industrial Cooperative Education student-learner graduates.
b. That there are a sufficient number of well-equipped prospective training establishments which will offer good training programs.
c. That there are enough prospective student-learners in the high school who meet the training specifications.

5. The Survey Instrument

Two different samples of a suggested survey instrument appear on the pages which follow. They are intended to provide school authorities with such information as will help to establish the need, if any, for an Industrial Cooperative Education program. The survey instruments will also indicate the occupations for which skilled workers are needed, as well as the numbers required.

Training Facility Survey

_____
Date

1. Name of firm _____

2. Official to be contacted _____

3. Address _____ Phone No. _____

4. City _____ State _____

5. Indicate occupations in your establishment which have need for skilled workers and have adequate facilities and personnel for training beginning workers.

Occupation	Number of Workers Needed
a.	
b.	
c.	
d.	
e.	

6. Are you willing to assist in a cooperative training program?

   Yes _____ No _____

7. May a representative of the local public schools call to present you with detailed information?

   Yes _____ No _____

8. Would you be willing to serve on a school advisory council representing your industry?

   Yes _____ No _____

9. Remarks _____

Signed _____

Title _____

Survey of Local Trade, Industrial and Service Establishments

_____
Date

1. Name of firm _____

2. Official contacted _____

3. Address _____ Phone No. _____

4. Number presently employed _____
Male Female Total

5. Percentage turnover per year _____ %

6. Do you employ part-time workers (1-30 hrs. per wk.)? If yes, list occupations _____

7. Are SPECIAL training facilities provided on the job, other than incidental training given a new employee?

Yes _____ No _____

8. Of the following traits, check those you consider most important

Accuracy	Dependability	Initiative
Cheerfulness	Emotional Stability	Neatness
Cooperativeness	Honesty	Physical Endurance
Courtesy	Industry	Punctuality

9. Does your company now cooperate with high schools in any type of school-industry programs?

Yes _____ No _____

10. Would the employment personnel of your company like to know more about the Industrial Cooperative Education program at the high school?

Yes _____ No _____

11. Remarks _____

_____

_____

B. Implementation of the Program

If the results of the survey indicate the possibility exists for an effective program being carried out, and if continuity is reasonably certain, the school authorities may take the required steps toward its implementation. Past experience indicates that about one year usually elapses from the time of the initial contact between the local school administration and the State Office for the actual start of the program at the local level. The various steps and the suggested time schedule enumerated below should serve as a guide to assure a successful beginning.

Fall Semester (September through January)

1. Hold an informational and fact-finding meeting
   (a) Superintendent invite 12 to 16 leaders in the community who represent employers, employees and community service organizations
   (b) Have a member of the State Staff present to explain the program
   (c) Secure opinion of the group regarding need and potential success
2. If the group opinion is favorable, make a survey of local establishments to determine interest and needs
3. Visit other programs to observe operation (Superintendent and School Board)
4. Secure approval from local Board of Education
5. Notify State Office that the school plans to start an Industrial Cooperative Education program next year as authorized by the local Board of Education

---

The foregoing procedures should be completed by the end of the first semester. Second semester procedures follow.

Spring Semester (February through June)

1. Select coordinator
   (a) Local supervisor may initiate the program, or
   (b) local teacher may act as teacher-coordinator, or
   (c) the school may employ a new teacher-coordinator
2. The superintendent should appoint a General Advisory Committee (See Chapter IX)
3. Carry on publicity program --
   Newspapers, faculty, student body, service groups, etc.
4. Student enrollment for next fall
   (a) Study cumulative records, interview, test, and make preliminary selection from present sophomore and junior students
   (b) Enroll selected students not later than April 15

5. Coordinator is employed by July 1
   (a) Coordinator is approved by State Board of Vocational Education and Rehabilitation
   (b) Person employed must have taken Industrial Cooperative Education courses in college and/or attend beginning coordinators' workshop conducted by State Staff
   (c) Duties of coordinator preceding opening of school
      (1) Locate training stations and interview trainers (Use the survey as a basis)
      (2) Fit students into proper stations
      (3) Order workbooks and other instructional materials -- $15.00 per student (1st year), $8.00 per student thereafter
      (4) Adapt instructional material to needs of local community
      (5) Prepare additional instructional materials as needed.

CHAPTER III

THE HIGH SCHOOL ADMINISTRATOR'S RESPONSIBILITIES

A. The Importance of the Administrator

This guide could in no way be considered complete without a word regarding the high school administrator and his role in the implementation and operation of an Industrial Cooperative Education program. A large part of the responsibility for the success of the program rests upon his shoulders.

B. Points of Guidance for the Principal

If the principal views the program as a dumping ground for all his misfit pupils, he dooms it to failure before it is inaugurated. If the principal looks upon the program as an extra-curricular activity, or a class unconnected to the regular school program, he does it a gross injustice. If he regards the coordinator as an individual who simply comes and goes as he wills, or as a person unrelated to the regular faculty, he misinterprets the coordinator's status and jeopardizes his chances of success.

It is equally important that the program be recognized for what it is: a training program. If it is considered merely a work program, it loses its true identity and thus, most of its usefulness.

The principal must accept the program as a regular and important part of his total school curriculum. He must realize that the coordinator is a bona fide member of the school faculty, available for regular faculty duties insofar as they do not interfere with the operation of the program.

C. Principal's Importance in Selection of Student-Learners

The principal is in a position to lend valuable assistance to the coordinator in the selection of student-learners. He must be interested and sympathetic. He should not prohibit any boy or girl who wants to enroll in the program from doing so because that pupil happens to be a better than average student of English, history, Latin, mathematics, etc., or because he comes from a home of better than average opportunities.

D. Fitting the Industrial Cooperative Education Class into the Schedule

It is recognized that the program may create some hardship in the making of a school class schedule, yet in no case has this problem been too difficult to solve. It is equally true that a student entering the class a week or two after school

starts sometimes presents a problem in the rearrangement of his schedule, but few have been the case wherein the situation hasn't been ably handled by the principal. It is likewise a difficulty of slight nature when a student-learner returns to regular classes at the end of his probationary period. This type case is very rare, and if the principal gives his wholehearted assistance in aiding the coordinator to select prospective student-learners, this problem seldom appears.

E. How the Principal Can Be Helpful

From the foregoing it is evident that the principal does play a vital role in respect to Industrial Cooperative Education in his school, and he must feel a deep obligation for the distinct service it renders and aid the program in as many ways as are possible, among which are the following:

1. Make the schedule to accommodate the related class. (This includes putting English IV, history, and English III, in particular, where the Industrial Cooperative Education student-learners can schedule them.)
2. Two student class schedules or programs (one academic and one cooperative) should be prepared for those planning to enter the industrial cooperative education program. This will facilitate transferring the student out of the program and back to an academic schedule in the event he cannot be placed in a training station or if he is found unsuitable for the cooperative program.
3. Recognize the Industrial Cooperative Education program as a regular and necessary class in the high school curriculum.
4. Recognize the coordinator as a regular member of the faculty.
5. Give wholehearted cooperation to the coordinator in the selection of prospective student-learners and in making available school records.
6. Make provision for assembly programs, etc., which can be put on by the Industrial Cooperative Education class.
7. Visit the classroom and find out what the student-learners are doing and how they go about their class work from day to day.
8. Visit training agencies with or without the coordinator.
9. Facilitate in every possible way the procurement of related instructional materials.

F. The Place of Vocational Education in the High School

A few high school principals have been somewhat afraid for vocational education to come into their schools because they have the conception that the vocational educator and vocational education are unfriendly toward the academic phase of education. This is an unfortunate misconception because the opposite is true. It is a fundamental precept and basic philosophy of vocational education that standing alone it is not functional; that vocational education proposes to supplement and not supplant cultural, academic learning.

CHAPTER IV

THE TEACHER-COORDINATOR

Since the optimum effectiveness of any cooperative program is primarily dependent upon the coordinator, his success will be determined by many factors. Personal qualifications, background of experience, aggressiveness, initiative, personality, professional attitude, appearance, application, enthusiasm, and ability to get along with others are some of the traits which affect program development.

The State Office will continually appraise the coordinator's activities as he conducts the local program. Maturity of mind and actions will keynote the coordinator's behavior. The degree of his interest and ability will determine the success or failure of the program.

A. Training of the Teacher-Coordinator

The following requirements for approval as a coordinator of industrial cooperative education programs are set forth in the State Plan for vocational education:

1. Graduation from an accredited college or university with a B.S. degree, including professional courses in industrial or vocational education.

2. Eight (8) semester hours in approved trade and industrial subjects including the preparation of instructional materials and other courses, such as:

   a. Development, Organization and Principles of Industrial Education
   b. Principles of Vocational and Technical Education
   c. History and Basic Concepts of Vocational Education
   d. Administration and Supervision of Industrial Education
   e. Organization and Administration of Industrial Cooperative Programs

   These course requirements should be completed within three (3) years from the date of employment as a coordinator.

B. Employment Experience of the Teacher-Coordinator

Two (2) years experience as a wage earner in one or more trade and industrial occupations or skilled trades acquired after high school graduation. One year of this experience shall have been in a single occupation or trade. A candidate with a Master's degree and a major in Industrial

Education, or three (3) or more years of successful teaching in the secondary school system where the coordination is to be carried out may qualify with only one year of employment experience.

C. Teaching Experience of the Teacher-Coordinator

Nine (9) months (one school year) of satisfactory teaching experience in the secondary schools, all of which shall have been in industrial arts or in approved vocational education subjects.

The above qualifications will be required for teacher-coordinators of both types of Industrial Cooperative Education programs outlined earlier.

In addition to the foregoing requirements, all beginning coordinators are expected to participate in a five-day workshop sponsored by the Trade and Industrial Education Service. This is usually held in Springfield the first full week after July 1 of each year and is conducted by State T & I staff personnel.

D. Approval of the Teacher-Coordinator

To secure approval as a teacher-coordinator it will first be necessary for the candidate to submit through his or her school office to the Trade and Industrial Education Service, State Board of Vocational Education and Rehabilitation, 405 Centennial Building, Springfield, Illinois, three copies (original and two carbons) of Form T & I 14 (Vocational Teacher's Record Card). Completeness and accuracy are essential.

By referring to the item-by-item procedures and the sample teacher's record card on the following pages, the applicant will be able to complete the forms properly. Upon receipt in the State Office, the applicant's record, including school transcripts and employment information, is reviewed. An overall evaluation on the basis of State Plan requirements is made. If approved, the school and/or applicant, are notified by a letter of approval. The prospective teacher-coordinator is then eligible to assume his responsibilities subject to the completion of any required professional courses not taken previously.

REQUIRED PROFESSIONAL COURSES AND COURSE EQUIVALENTS IN MEETING VOCATIONAL CERTIFICATION FOR TRADE AND INDUSTRIAL EDUCATION PERSONNEL

* In addition to the college courses all new coordinators of industrial cooperative education are required to attend a five-day training conference conducted by the Division of Vocational and Technical Education, State Board of Vocational Education and Rehabilitation.

Instructions for Completing Vocational Teacher's Record Card
(Type or Print)

Name: Last name - first name - middle name

Address: Number and street, city, state and zip code number

Photo: A small photo should be attached

Residence Phone: Your current residence phone number

Place and Date of Birth: City, state or country - month, day, year

Certificate Held: Indicate kind of certificate now held. If no certificate has been issued to you, write "none"

Subject: Coordinator - Industrial Cooperative Education

Schools Attended: List in sequence all schools attended, including elementary, high, trade, technical and college

Location of School: Show city and state for each school attended

Attendance: State beginning date (month and year) and ending date (month and year) at each school

Courses Completed: Eighth grade graduate, high school graduate, college degree, if any, with major field of study

Professional Training: List only those professional vocational education courses taken in preparation for teaching. Show the names of schools, their location, the number and title of the courses, the dates of attendance and the semester hours credit earned

Employment Record: Fill in the name of each firm or company by whom you have been employed. State address of each employer, list all periods of employment showing the dates from (month and year) to (month and year) and attach letters verifying employment

Teaching Experience: List your teaching experience. Give the names of schools, their location, employment dates, subjects and grade levels taught

Signature: Sign and date (Submit three (3) copies)

NOTE: Attach one (1) copy of the coordinator's college transcript of credits to the Vocational Teacher's Record Card.

E. Personal Traits of a Good Coordinator

1. Diplomatic

   a. He should always say the right thing at the right time.
   b. He should never intentionally antagonize anyone.
   c. He realizes that even though the other person may be wrong, it is better many times to leave that person in his ignorance.
   d. He does not tell the employers of student-learners how to run their business.
   e. He is considerate of the employer's time and is able to sense when an interview is finished.

2. Sense of Humor

   a. He can laugh with his student-learners.
   b. He can appreciate a joke on himself.

3. Control of Temper

   He does not lose his temper under vexing situations.

4. Responsibilities

   He fulfills his responsibilities to:

   a. The student-learner
   b. The training agency
   c. The school
   d. The State Board of Vocational Education.

5. Sympathetic

   a. He appreciates his student-learners school problems.
   b. He appreciates his student-learners employment problems.

6. Disappointment

   He is able to take the disappointment when certain situations do not work out to the satisfaction of the students, their parents, the trainer or the school.

CHAPTER V

THE COORDINATOR BEGINS HIS WORK

A. Training for the Job

The coordinator, like anyone else starting a new endeavor, should have training in the methods found to be most effective for the job he has to do. Although he may have had experience as a teacher in the secondary schools, he will find that the job of coordinating an Industrial Cooperative Education program involves new experiences which he has never before encountered.

B. School and Community Contacts

The coordinator should be ready to go to work in setting up the program following completion of the workshop for beginning coordinators. It will take from four to six weeks prior to the opening of school in the fall to have everything ready for the students to enter training on the first day of school. The first contact should be made with the administrators of the school to discuss the plans to be followed, to look over the facilities for the related classroom and to determine the method of ordering the reference materials needed.

Immediately following his conference with the superintendent and/or principal, the coordinator can very well spend one or two days simply presenting himself to the businessmen of the community, telling them why he is there and what he plans to do. If the superintendent or principal can accompany him on this "tour," so much the better. It is highly advisable that the coordinator, while in this get-acquainted campaign, be sure to see the employers who were contacted in the preliminary survey.

Early in the planning of the program, the coordinator should get acquainted with the counselors to find out what preliminary work was done with students toward informing them of the program. He may have a list of students who have indicated an interest in the training. He will undoubtedly have available files which will help in selecting students. If he is not personally acquainted with a student, he can direct you to someone who is.

C. Organizing a Consultant Committee

If the coordinator is strange to the community, he could easily make serious mistakes by proceeding along "unknown ground" without guidance. It might be possible that an employer would assign a student-learner to a trainer who would not have a good moral influence. It is possible that a training situation could be misrepresented and the em-

ployer might exploit the student-learner rather than provide all-round training. Again, the coordinator might place a student-learner in a training agency that is unpopular for one reason or another.

The way to insure proceeding along safe and sure lines is to have a committee of local persons upon whom the coordinator can depend for advice and guidance. The superintendent should suggest the names of three or four men who he knows have lived in the community a long time and who are accepted as responsible, reliable leaders.

The purpose of this committee is to give guidance to the coordinator in getting the program started. Before approaching an employer to secure his cooperation in training a student, the coordinator should seek the advice of the committee. The organization and functioning of consultant committees is detailed in Chapter IX.

D. Presenting the Plan to the Community

In the event that a representative of the State Office did not speak to the local civic clubs at an earlier time, it is highly advisable that the superintendent arrange for the coordinator to talk to each club. At the time the coordinator meets the civic clubs, he should deliver a carefully prepared talk of about twenty minutes duration in which the entire Industrial Cooperative Education program is explained. At the end of the talk, give the men an opportunity to ask questions which should be answered clearly and concisely.

The superintendent should also see to it that a reporter from each local newspaper is present. The coordinator should be permitted to review any write-ups before publication.

At proper intervals the coordinator should supply information to the newspapers in the form of well-written articles which explain Industrial Cooperative Education to the public, tell of its place in the local high school and progressively keep the community informed as to the progress of the program.

In the process of presenting the plan to the community by means of talks, interviews, conferences and newspaper publicity, the coordinator will find valuable assistance in the following tables:

MATERIALS TO USE	AVAILABLE SOURCE
1. Bulletins	1. Federal, State and local bulletins
2. Literature	2. Magazine articles

MATERIALS TO USE	AVAILABLE SOURCE
3. Charts, graphs, slides, pictures, examples of schedule of processes and student notebooks	3. a. Federal, State and local bulletins b. Workshop reports c. Statistics compiled in State Office d. Workbooks e. Surveys (1) Local information (2) Census reports (3) School records f. Other programs
4. Employment possibilities	4. a. Employment Service b. Local surveys
5. Accomplishments and possibilities	5. a. Federal, State and local bulletins b. Results from other programs
6. Facts about other programs	6. Yearly summary reports from local programs
7. Comparative facts of programs	7. a. Federal, State and local bulletins b. Comparative results of different types of school programs c. Actual cost of different types of training programs
8. Employment records of former students	8. Follow-up study conducted annually
9. Training needs as indicated by students	9. Survey of student body applications
10. Employment information a. Labor turnover b. Average age of those employed in occupation c. Method of entrance d. Number of trained workers and learners in each occupation e. Length of training period f. Physical requirements of employees g. Hazards of the occupations h. Possibilities of promotions	10. a. Statements of individual employer b. Labor department statistics c. Census reports d. Apprenticeship, laws, rulings and policies e. Insurance charts and data f. Industrial history and economics

MATERIALS TO USE	AVAILABLE SOURCE
11. Scale of wages, rates of pay	11. a. Statements of employers b. Statistics
12. Steadiness of employment (seasonal)	12. Labor department statistics
13. Employer's policies	13. Statement of employers
14. Channels of authority	14. Study of labor and company policies
15. Economic statistics of the occupations	15. a. Census report b. Industrial economics c. Labor department statistics
16. Opinions of employers	16. Statement of employers
17. Opinions of labor	17. Statement of labor leaders
18. Actual cost of different types of training programs	18. Listing of data available

E. Avoiding Difficulties

"An ounce of prevention is worth a pound of cure" is an old adage which can apply in coordinating an Industrial Cooperative Education program. It is well that the coordinator study the difficulties he is likely to encounter and do everything within his power to avoid criticism. In the event difficulties are encountered he may be able to overcome them by employing some of the methods suggested in the following chart:

DIFFICULTIES LIKELY TO BE ENCOUNTERED	HOW TO OVERCOME THESE DIFFICULTIES
1. Possible criticism as to relative per capita cost of the program	1. Cite advantages to school due to: a. Comparatively low equipment and supply cost b. Value of created interest in school and work (holding power of school is increased) c. Broadening school curriculum to better meet occupational needs of community d. Permitting boys and girls to secure their training without leaving their home community

DIFFICULTIES LIKELY TO BE ENCOUNTERED	HOW TO OVERCOME THESE DIFFICULTIES
	1.
	e. Furnishing occupational preparation plus academic training
	f. Adjusting pupils to the responsibilities of citizenship earlier in life
	g. Reimbursement from state and federal funds decreases the net cost of the program to the community
2. Possible objections to program by labor	2. Assure representatives of labor that:
	a. Program is not designed to flood market with learners in any one craft
	b. Program will be to provide replacements as approximately 5% leave trade each year (endeavor to secure local statistics)
	c. The training is for developing workers for the future
	d. The training is available for their children -- an opportunity their parents did not have
	e. The student-learners are not replacing anyone who is now employed
	f. The program is not to turn out journeymen workers (pre-apprentice training)
	g. The program is guided by a representative advisory committee in which labor has a voice
	h. It provides an organized plan of training in the occupation of the student's choice and in which he is interested
3. Possible charge that youth is being exploited	3. Explain that:
	a. Students are workers and are paid while on the job in an organized training program
	b. The wage is a comparable one

DIFFICULTIES LIKELY TO BE ENCOUNTERED	HOW TO OVERCOME THESE DIFFICULTIES
	3. c. The working conditions are checked by the coordinator d. A progressive schedule of processes to be learned is an essential feature
4. Possible charge that vocational teachers (coordinators) feel they are separate from and do not have to take part in school programs	4. The coordinator is a member of the high school faculty and must make himself a part of the school program in every possible way without neglecting his specified duties.
5. Possible criticism that the work program disturbs school schedule	5. a. Cooperate with principal and faculty in arranging schedules b. Show that this is a minor difficulty c. Explain how schedules are arranged in other high schools having the Industrial Cooperative Education program
6. Possible fears that a satisfactory schedule for compensation cannot be arranged	6. a. Explain that pay will be approved by advisory committees b. Point out what is being done elsewhere
7. Possible objections to hazardous work in some occupations	7. Explain that: a. Safety precautions will be practiced and stressed b. Student will be protected by insurance just as any other employee c. Student will not be placed in any training where he cannot work legally d. Student will not be placed at work without the consent of his parents

F. Coordination Time

The teacher-coordinator devotes a part of his time to counseling with prospective students, correlating work experiences on the job with school instruction, organizing necessary instructional materials, and in supervising and directing the student-learner's study of related and technical information as it

applies to the occupations in which they are engaged. Coordination time shall depend upon enrollment. In addition to the related subjects class, not less than one (1) clock hour per day, five (5) days per week for each ten (10) students or fraction thereof is required.

G. Selection and Equipment of Classroom

At some point during the preliminary "ground work," the coordinator and administrator should select a well-lighted classroom and begin equipping it with the necessary furniture. Due to the type of instruction carried on in an Industrial Cooperative Education related class, it is preferable to equip the room with tables and chairs, rather than the conventional type school room seats or desks.

The tables should be arranged in a "U" shape with the chairs on the outside of the U. The coordinator's desk should be between the tips of the U and slightly outside the enclosed space. The tables and chairs should be so placed that, if possible, no student-learner receives a glare of light entering through windows. Consult the suggested classroom arrangement which follows:

The classroom, library, and other facilities, including instructional equipment, supplies, teaching aids, and other materials should be adequate in quantity and quality so that they will enable those who are to be trained to meet their occupational objective. The necessary facilities, equipment, and supplies for the related subjects classroom, according to the general requirements of the State Plan, are:

a. ordinary classroom
b. tables and chairs
c. blackboards, 8 to 12 feet
d. bulletin board space
e. chalk and erasers
f. adequate lighting facilities
g. typewriter, table and chair
h. access to mimeographer or duplicator
i. teacher's desk and chair
j. bookcase
k. magazine rack
l. four-drawer letter file
m. two-drawer, 3 x 5 card file
n. workbook cabinet
o. reference material shelving
p. stationery
q. stamps
r. mimeograph supplies
s. paper, second sheets, carbon
t. file cards and indices
u. file folders and indices

H. Instructional Materials

The community must also agree to provide adequate funds to secure necessary instructional materials, including reference books, texts, bulletins, pamphlets, trade journals, correspondence courses, charts, magazines, etc. A well-equipped related subjects library is needed to insure that pertinent, practical and current occupational practices may be taught.

SUGGESTED ARRANGEMENT FOR THE
INDUSTRIAL COOPERATIVE EDUCATION CLASSROOM

The funds which are provided by the local school authorities shall not be less than $15.00 per student-learner during the first year that the program is in operation. The second year $8.00 per student-learner is to be provided, and thereafter such amount as will adequately provide necessary instructional materials. These amounts should be spent at the discretion of the coordinator.

I. Duties of the Coordinator

The following are among the more important duites of the coordinator. No attempt has been made to list them in any order of importance.

1. Survey training needs and opportunities of the community
2. Secure community cooperation
3. Secure employer cooperation
4. Secure school cooperation
5. Secure student cooperation
6. Make or secure occupational and trade analyses as needed
7. Work with advisory committees
8. Work with employers to develop a schedule of processes and related subject topics
9. Select training stations and place student-learners
10. Encourage employers to adopt fair schedule of wages
11. Organize, develop, correlate, and teach related subjects
12. Correlate related study with on-the-job training
13. Supervise teaching done by the training station
14. Establish a clear understanding of the program on the part of the school, the employers, the students, the parents and the public
15. Make talks explaining the training program before various groups to establish good working relations
16. Keep systematic records and reports
    a. State report (on time)
    b. Progress reports
    c. File or mail
    d. General data (permanent record)
    e. Training memorandum
    f. Training data
    g. Training plans
    h. Contacts made and results accomplished
    i. Visitation reports
    j. Student applications
    k. Employer's rating (periodic)
    l. Student rating sheets
    m. Regular school records, etc.
17. Arrange students' school and work schedules
18. Prepare bibliography of related materials and keep library records
19. Work with school faculty for student improvement
20. Confer with students on personal achievement, job achievement, and social achievement

21. Confer with prospective Industrial Cooperative Education students and parents
22. Follow-up former students after placement in permanent jobs
23. Visit parents in the homes of student-learners

J. Professional Growth and Development

Continued professional growth and personal development are essential characteristics of the successful coordinator. These may be summarized as follows:

What the Coordinator Does	What the Coordinator Needs to Know
Keeps up to date by working part-time in industry or business	Job analysis
Develops ability in dealing with others	How to talk with different groups of people
Keeps up to date professionally	How groups react
Attends workshops	How individuals react
Reads current literature on his specific field	Sources of materials
Takes further college work	How to work with and in groups
Attends and participates in meetings of education groups such as: AVA, IVA, IIEA, NEA, PTA, Round Table and faculty meetings	The nature and purpose of professional organizations
Develops an ability to get things done	The psychology of securing cooperation
Asks for constructive criticism of himself and the program by those in position to judge	Know how to appeal to specific groups
Develops the ability to speak effectively to specific groups	How to accept and evaluate criticism
Improve his personal grooming and manners	Public speaking
	How to set an example for others
	Everyday courtesy
	Know clothes and how to wear them

Professional Relationships

Works with students and faculty on overall school program	How to work with students and faculty
Explains the program to the faculty	Details of the program
Talks at faculty meetings	Points of the program that appeal to teachers
Discusses the program with new members of faculty	How the program fits into the total school program
Uses audio-visual aids	Scheduling problems and procedures

Talk with counselors, teachers and office staff about student problems Observe school rules, policies and customs in ethical manner	School rules, policies, customs and traditions

K. Administrative Relationships of the Teacher-Coordinator

Among the many and varied activities which are inherent in the work of the teacher-coordinator, we include those which relate to his relationships with the school administration as indicated below:

What the Coordinator Does	What the Coordinator Needs to Know
Explains needs and progress of program clearly to the administration Sees that all students meet over-all requirements for school graduation, including college entrance requirements Works for integration of co-operative eduction into the school program Presents the program budget Makes an annual written report to the principal and superintendent Procures administration participation in the following activities concerned with cooperative students: Employer-Employee Banquet Advisory Committee meetings Visits to students and employers on the job Visits to students' social and business meetings Shares other school responsibilities Clears all newspaper releases and special programs	How to follow proper lines of authority Basic philosophy of Vocational Education Specific objectives of cooperative education Legal background of Vocational Education Requirements for cooperative education Local school and state policies on graduation and college entrance requirements Year-by-year curriculum requirements of students Basic school policy Classroom and library needs Current costs on items needed New materials and methods Fundamentals of general school budget

CHAPTER VI

SELECTION AND PLACEMENT OF STUDENT-LEARNERS

A. Importance of Careful Student-Learner Selection

It is imperative that the coordinator recognize the fact that the student-learner is the most important element in the program. The success of the program, therefore, is going to depend to a great extent upon the selection of student-learners.

B. Criteria for Selection

"The purpose of any vocational education program is to prepare individuals for employment, or to give additional training to those already employed, and to place them in occupations in which they can be happy, successful and useful. One's occupation is an important, if not the dominant factor in his life, and its selection should involve careful study and guidance. It is unwise, therefore, to select students for a vocational education program on the basis of first come-first served.

"In all cases, the coordinator should make sure that the individual has an interest in the occupation, that he has the size, ambition, intelligence, personality, etc. necessary for success in employment.

"It will be found that some students cannot remain in school without the aid of part-time employment. Wherever possible, such students should be included in the program and encouraged to remain in school...

"There is another group of youth who should be served through the program. They are those who have dropped out of school and are working either part-time or full-time in industry. These boys and girls should be encouraged to return to school full-time and complete their high school courses through the program. In some communities a young adult Industrial Co-operative Education program may be available."*

C. Student-Learners' Eligibility for the Program

Students selected for training in this program shall be from those who are at least sixteen (16) years of age. They must be eligible for enrollment in the last two years of the regular high school program, unless individually recommended in

*Selvidge, R. W. and London, H. H., Essentials of Effective Teaching in Diversified Occupations, Unpublished paper. Industrial Education Department, University of Missouri, Columbia, Missouri, 1939

writing to the teacher-coordinator by the local advisory committee, guidance counselor or principal. This would also include those students who may have previously dropped out and who have reentered school with junior or senior standing.

D. Sources of Information about Prospective Student-Learners

When the coordinator receives an application for entrance into the program, he should begin studying the prospective student-learner from all angles. Individual conferences should be held with the student; his school record should be examined; previous teachers should be consulted; his home should be visited and acquaintanceship with his parents established. Through these media, the rating scale which follows may be completed and an evaluation thus made of the prospective student's potentialities.

RATING SCALE

Name of Student _____ Date _____

In the proper spaces provided below, check student on the items listed, and write in the ( ) points on each item, then total.

TRAITS	DESCRIPTION	POINTS
1. Ability to learn	Quick (4) Fair (2) Slow (0)	_____
2. Capacity for work	Unusual (4) Industrious (3) Average (1) Poor (0)	_____
3. Judgment	Uncanny (4) Sound (3) Average (1) Poor (0)	_____
4. Initiative	Exceptional (4) High (3) Fair (2) None (0)	_____
5. Appearance	Very neat (4) Neat (3) Careless (2) Sloven (0)	_____
6. Leadership quality	Outstanding (4) Noticeable (2) Low (0)	_____
7. Desire to make good	Pronounced (3) High (2) Average (1) Low (0)	_____
8. Ability to take orders	Outstanding (3) High (2) Average (1) Low (0)	_____
9. Reliable	Very (3) Ordinarily (1) Unreliable (0)	_____
10. Perseverance	Unlimited (3) Ample (2) Moderate (1) Weak (0)	_____

The following columnar arrangement of what the coordinator "does" and should "know" will more clearly illustrate his role in the selection and placement of students:

What the Coordinator Does	What the Coordinator Needs to Know
1. Selection	
Explain cooperative program to students	Objectives, operation and policies of program
Make a survey of prospective students	When and how to survey students
Secure applications from students	What is needed in application form
Interview students	Type of student desired
Discuss applicants with counselor, principal or teachers	How to conduct interview
Give or arrange for tests	Questions to be asked
	How to interpret answers
	How to work with counselor and others
	Understanding of counseling program
	How to administer and interpret tests
2. Placement	
Get recommendations and evaluation of possible training stations from advisory committee	Requirements for a training station
Make survey of training stations	How to work with advisory committee
Explain program	When and how to make survey
Determine type of student desired	Business terms and principles
Select students to apply for job	Correct approach and how to explain program
Analyze all information about students	How to fit the student to the job
Explain job situation to students	Procedures of applying for a job
Help student apply for job	Wage and hour and child labor laws
Prepare for interview	Jobs normally performed in this occupation
Prepare training plan	Job analysis
Help set wages and hours	Sources of information for job descriptions
Help list jobs to be learned and explain rotation	Graduation requirements
Ask for suggestions on related instruction and instructional materials	Understanding of schedule problems
Explain general operation of program to manager and trainer	
Get approval of parent and student	
Arrange student's schedule	

Prior to the initial contact between the student and coordinator, it is advisable that the student fill out an application form. The completed application will provide information relative to the student's interests, abilities and adaptability to the chosen occupation.

STUDENT'S APPLICATION FORM

School _____ Date _____

Name _____ Date of Birth _____ Age _____
Last First Middle

Address _____ Phone _____ Sex _____

Weight _____ Height: Ft. _____ In. _____ General Health _____

Physical Handicaps _____ Sight _____ Hearing _____

Student's Signature

The following are suggestions for Interviewing, Testing, Evaluating and Reviewing the potential of the prospective Industrial Cooperative Education student.

1. Interviewing

   a. First contact. The coordinator will find out the following things:
      (1) Name
      (2) Age
      (3) Class in school
      (4) Reason for wanting to enter the program
      (5) Occupational interest of the student

      The coordinator might at this time provide the student with information about cooperative training and about various trades covered. Some coordinators have the students complete the application form before the first interview. Others have the form completed during or immediately after the first interview.

   b. Second contact. The coordinator and applicant might:
      (1) Review the information on the application form
      (2) Discuss parents opinion of student's choice
      (3) Discuss possible training stations
      (4) Make arrangements for testing if necessary

2. Testing

   It is suggested that the coordinator might:

   a. Analyze the occupation for aptitudes and skills required

   b. Check to see if tests have been administered that would evaluate the student's aptitudes and interests

   c. If test scores are not available, arrange for student to take tests. Types of tests and inventories that could be used are:
      (1) Vocational Preference or Interest Inventories (Kuder)
      (2) Mechanical aptitude tests (Science Research Assoc.)
      (3) Mechanical reasoning (Differential Aptitude Tests)
      (4) Intelligence tests that include tests of abstract reasoning
      (5) Contact the nearest office of the Illinois Employment Service and arrange for aptitude testing

3. Evaluation and Reviewing. The coordinator will finally accept or reject the student on such things as the following:

   a. Scholastic qualifications
   b. Aptitude for the occupation
   c. Interest in learning a trade
   d. Physical qualifications
   e. Attitude of parents toward Industrial Cooperative Education
   f. School records on attendance and discipline and teacher's and counselor's comments.

E. Selection of Student-Learners - Factors to Consider

THE STUDENT

1. Motive: Sincere desire to learn a trade or occupation
2. Adaptability
   a. Scholarship and I.Q.
   b. Type literature read
   c. Extra-curricular activities
3. Attitude toward:
   a. A particular job and work in general
   b. Authority--superiors at school
   c. Employers
   d. The faculty and school
   e. Training in general
   f. Parents
   g. Church and general principles of morality
   h. Success and how it is attained
4. Personal traits
   a. Honesty
   b. Reliability
   c. Punctuality
   d. Cooperation
   e. Personal appearance
   f. Self-control
   g. Confidence
   h. Courtesy
   i. Initiative
   j. Industry
   k. Accuracy
   l. Interest
5. Aptitudes evidenced by:
   a. Jobs previously held
   b. Extra-curricular activities (student offices)
   c. Hobbies - achievement
   d. Tests - ISES
6. Age: 16 years minimum
   18 years in some trades
7. School achievement: At least 8 units of high school credit
8. Is now working part-time
   a. His job fits into the objectives of the cooperative program
   b. He is receiving an all-round training
   c. He has to work
9. School program: His required courses can be adapted to Industrial Cooperative Education

THE PARENTS

1. Understanding of and sympathetic attitude toward program
2. Willingness to cooperate in having student-learner do his part
3. Attitude toward suggested training agencies and their personnel
4. Attitude toward coordinator
5. Occupations and social standing of parents
6. Willingness for student to work
7. Ambitions for child
8. Attitude toward civic affairs
9. Character, reputation, and dependability
10. Church preference
11. Home environment
12. Educational background
13. Financial standing

F. Interviewing the Prospective Student-Learner

As soon as possible, the coordinator should begin interviewing the prospective student-learners. If the principal or guidance director has a survey of these students before school was out during the spring term, the coordinator will have this list for use. A telephone call and/or a postal card to each student can notify him that the coordinator is on the job and that he will contact him for a personal interview at a specified date and time of day.

If no preliminary survey has been made of the student body, it then becomes necessary to depend upon newspaper publicity to inform the students. No doubt the principal, guidance director, and teachers can given the coordinator names of prospective student-learners.

Using the completed application as a basis for thought, the coordinator talks to the student and draws out as much pertinent information as is possible or that is necessary. From this point, the coordinator proceeds with the routine check-up to match the individual student with the analysis "Selection of Student-Learners - Factors to Consider" appearing on the preceding page.

G. Factors to Consider in Selecting an Occupation for Training

In discussing with the student the occupation for which he wishes to train, the coordinator must keep in mind that the occupation shall be one for which the preparation requires organized related instruction in school and progressive employment experiences on the job. No occupations will be included in the program which do not provide an opportunity for continued employment without displacement of other workers.

The coordinator and the prospective student-learner should examine the occupation in which the student-learner is interested and measure its desirability along the following lines:

1. Opportunity for employment after training
   This factor is essential because if the occupation is already overcrowded, it would be difficult for those who complete the training to secure employment. Is there a considerable turnover in employment in this occupation? Is there a scarcity of learners or apprentices?

2. Stability of employment
   This factor is worthy of consideration from the standpoint of the permanency of an occupation. Is it an occupation which is changing or which may be eliminated through specialization or technological changes? Is this occupation likely to remain in the community?

3. Opportunity for advancement
Under this factor the student and the coordinator should consider the possibilities for advancement in the occupation. Is it a calling in which, with diligent application and study, a student could reasonably expect to advance to a higher position?

4. Social value
It should be studied with a view of determining the value of the occupation to society as a whole. For example, is the machinist's trade necessary to the welfare of society as a whole? Does the electrical worker render a necessary service?

5. Length of training period
In choosing an occupation, the coordinator and student should give some study to the length of time necessary to become proficient in its practices. A student-learner should never be placed in training on a cooperative basis in an occupation which can be mastered in six weeks to six months. If the learning period for an occupation is more than two years, perhaps some arrangements could be made to credit the student with the time spent in the Industrial Cooperative Education Program.

6. Training carry-over
Consider this factor from the standpoint of the knowledge and skill gained carrying over into some other occupation. Will the training enable a person to more easily fit into employment in some other allied occupation?

7. Regularity of employment
In considering this factor, determine whether employment will be seasonal or whether it is an occupation in which a worker can reasonably expect to be employed throughout the year. Is employment in this occupation subject to rapid fluctuations?

8. Pay
This factor is included because a coordinator in counseling with students and parents must be able to give information as to the compensation which trained workers receive in the vocation being considered.

9. Training facilities
This is an important factor to study. Does the training agency in which a student is to be placed have adequate equipment to afford all-round training? Will someone have sufficient interest and time and ability to train the student-learner?

10. Safety conditions
The coordinator in selecting occupations in which to place students in training should by all means give thorough consideration to the dangers and hazards to which the workers are exposed.

The preceding points are shown in the chart which follows. This chart is a sample of the rating given auto mechanics in a certain community. Obviously, certain items are uniform for the occupation anywhere, while others will show variation, dependent upon conditions in the particular community at that particular time. Such a chart is convenient for the coordinator and students to use in rating or measuring an occupation for its training value.

RATING CHART FOR MEASURING AN OCCUPATION

Occupation AUTO MECHANICS City

	Very Poor	Poor	Fair	Good	Very Good
1. Opportunities for employment after training					X
2. Stability of employment					X
3. Opportunity for advancement			X		
4. Social value					X
5. Length of training period				X	
6. Training carry-over					X
7. Regularity of employment					X
8. Pay			X		
9. Training facilities				X	
10. Safety conditions		X			

After the coordinator and students have rated the occupation, the student should be made fully aware of all factors which may not appear to be favorable. This may avoid having a student-learner disappointed in his occupational choice later.

H. Factors to be Considered in Selection of Training Agencies

Now that the student has been checked and his chosen occupation evaluated a training agency should be selected and evaluated. In this selection, it must be kept in mind that no student-learner may be placed in a training agency wherein he will displace another employee. The prospective employer must be considered on the basis of the following:

1. Employer's attitude toward:

   a. Employees
   b. Training (is employer willing to permit training in various phases of the occupation)
   c. The public
   d. Moral standards
   e. The high school
   f. Working conditions
   g. Wages and hours
   h. The coordinator

2. Training environment

3. Facilities for training

4. Training personnel

5. Wages of regular employees

6. Willingness to employ student-learners full-time after completion of training

I. Selecting a Training Agency

After the student-learners have been selected, their occupations chosen and the possible training agencies approved, the coordinator approaches the employers and thoroughly explains the program. He then is ready to present them with a definite proposition. The proposition is: "Will you cooperate with the schools in training a young man or woman in his or her life's work?" At this point, it is imperative that every employer clearly understand:

1. That he will pay the student-learner a monetary wage comparable to that paid other beginners in the occupation.

2. That the student-learner will be transferred from one job process to another upon reaching the proficiency level required for satisfactory performance in the occupation. This is called "job progression" or "rotation."

3. The the Fair Labor Standards Act of 1938 as amended prescribes minimum rates of pay for workers engaged in interstate commerce. Care should be taken that the operators of such businesses realize that the student-learner is a regular employee and must receive the minimum wage prescribed by law, unless a special wage exemption certificate has been issued. (A sample form of the certificate follows. A supply of the blank forms may be obtained from the U.S. Department of Labor (Wage and Hour and Public Contracts Division), 219 South Dearborn Street, Chicago, Illinois.)

Budget Bureau No. 44-R396.10
Approval Expires June 30, 1968

U. S. DEPARTMENT OF LABOR
Wage and Hour and Public Contracts Divisions

APPLICATION FOR A CERTIFICATE TO EMPLOY A STUDENT-LEARNER

The certification of the appropriate school official on the reverse side of this application shall constitute a temporary authorization for the employment of the named student-learner at less than the statutory minimum wage applicable under Section 6 of the Fair Labor Standards Act of 1938, as amended, or at wages below the applicable Walsh-Healey Public Contracts Act minimum wage determination, effective from the date this application is forwarded to the Divisions until a student-learner certificate is issued or denied by the Administrator or his authorized representative, *provided* the conditions specified in Section 520.6(c)(2) of the Student-learner Regulation (29 CFR 520) are satisfied.

PLEASE READ CAREFULLY THE INSTRUCTIONS FOR COMPLETING THIS FORM
PRINT OR TYPE ALL ANSWERS

1. Name and address of establishment making application:	3. Name and address of student-learner: Date of Birth:
2. Type of business and products manufactured, sold, or services rendered:	4. Name and address of school in which student-learner is enrolled:

Information on school instruction:

5. Number of weeks in school year		11. Are Smith-Hughes Act or George-Barden Act funds being used for this program? (Yes or No)	
6. Total hours of school instruction per week		12. Was this program authorized by the State board for vocational education?	
7. Number of such hours *directly* related to employment training		13. If the answer to item 12 is "No" give the name of the recognized local educational body which has approved this vocational training program:	
8. Proposed beginning date of employment			
9. Proposed ending date of employment			
10. Proposed graduation date of student-learner			

14. Outline the school instruction *directly* related to the employment training. (List courses, etc.)

Form WH-205 (10/63)

ATTACH SEPARATE PAGES IF NECESSARY

Information on employment training at special minimum wages:

15. How is employment training scheduled (weekly, alternate weeks, etc.)?	19. Title of Student-learner occupation:
16. Number of weeks of employment training at special minimum wage	20. Number of employees in this establishment
17. Number of hours of employment training a week	21. Number of experienced employees in student-learner's occupation shown in question 19
18. Special minimum wage(s) to be paid student-learner (if a progressive wage scale is proposed, enter each rate and specify the period during which it will be paid):	22. Minimum hourly wage rate of experienced workers in 21
	23. Is an age or employment certificate on file in this establishment for this student-learner? (If not, see instructions)
	24. Is it anticipated that the student-learner will be employed in the performance of a Government contract subject to the Walsh-Healey Public Contracts Act?

25. Outline training on-the-job (describe briefly the work process in which the student-learner will be trained and list the types of any machines used).

26. Signature of student-learner:

I have read the statements made above and ask that the requested certificate, authorizing my employment training at special minimum wages and under the conditions stated, be granted by the Administrator or his authorized representative.

(Signature of Student) *(Date)*

27. Certification by school official:	28. Certification by employer or authorized representative:
I certify that the student named herein will be receiving instruction in an accredited school and will be employed pursuant to a bona fide vocational training program, as defined in section 520.2 of Student-Learner Regulations.	I certify, in applying for this special certificate, that all of the foregoing statements are, to the best of my knowledge and belief, true and correct.
(Signature of School Official) *(Date)*	*(Signature of employer or representative)* *(Date)*
Title	*Title*

ATTACH SEPARATE SHEETS IF NECESSARY

4. That if the employer has three employees on at least one day of each of twenty or more calendar weeks in a calendar year and takes on a student-learner in addition, this student-learner will count as the fourth employee and the employer automatically becomes liable for the Federal Unemployment tax feature of the Social Security Legislation.

   That if the employer has two employees and takes on a student-learner in addition, this student will not count as the third employee if the student-learner is a minor (males under 21, females under 18) when principal occupation is as a student actually in attendance at a public or private school, unless taxes with respect to such services are voluntarily paid under the Federal Unemployment Tax Act.

5. That the student-learner must secure a Social Security number and that the employer and student-learner will pay the taxes appertaining thereto.

6. That the student-learner will work at least three hours per day each school day, thus working a minimum of 15 hours per week.

7. That the student-learner will receive a minimum of one period per day of general and specific related training in the school.

J. Criteria For Determining Trade and Industrial Occupations

1. It should be trade and industrial in character.

   a. Occupations which are unquestionably trade and industrial:

      (1) Any occupation in which a major portion of the work involves the manufacture, processing, repairing, servicing or installation of a product.
      (2) Any occupation listed as technical, skilled or semi-skilled in Dictionary of Occupational Titles.

   b. Occupations which are usually trade and industrial:

      Public or personal service occupations where service is rendered to or performed on or for the general public.

   c. Occupations which are not trade and industrial:

      (1) Occupations which require a college degree.

(2) Occupations which are definitely in the fields of Agriculture, Homemaking, or Business Education

d. In case of doubt, send pertinent information to the State Office for evaluation before enrolling the student.

2. It should require one or more years of "on-the-job" training.

3. It should be valuable for the welfare of society.

4. It should offer reasonable possibilities for employment and advancement in the trade.

5. In no case should a placement be made in an occupation for which Day Trade training is offered in the same school without an understanding between the instructors involved.

K. The Employer-Student Interview

After the employer thoroughly understands the working of the program and he agrees to train one or more student-learners, the next step is to send students to him for interviews. If possible, more than one student should be sent for the employer's consideration. This emphasizes the fact that the final selection of all student-learners is left to the employer.

It is true that poor job placements will probably be made, but these should be as few as possible. If at any time the work of the student-learner is not satisfactory, he may be removed and another student selected. It may be that he can be shifted to another type of work for which he is better suited, or even placed with another employer.

L. Training for the Employer Interview

By the time a coordinator interviews several student-learner applicants, he will become increasingly aware of the fact that the average high school student knows absolutely nothing about the techniques involved in making a successful contact and interview with an employer. This throws an additional duty upon the coordinator; the student must be coached in the fine art of being interviewed.

For that purpose, before sending any students to a prospective employer, assemble as many student applicants as have applied at that time and teach them to approach an employer, announce the purpose of the visit and carry to a successful end the entire interview.

M. What All Parties Concerned Should Know Before Student-Learner Goes on the Job

As a result of the interview the student will be either hired or rejected. This brings the coordinator to the point where he should review the entire situation in order to be sure that employers, student-learners and parents thoroughly understand all phases of the program. These include:

1. That the student-learner will take two regular high school subjects in school each day.

2. That the student-learner will spend at least one period in a related subjects class each day.

3. That the student-learner will work in his training agency at least fifteen hours per week learning the manipulative skills of the occupation.

4. That at the end of a trial period established by the school if the student-learner has not shown proficiency or a tendency to learn or demonstrates a poor attitude, then he may be dropped from the program. The purpose of the trial period is to provide a try-out period for both the student-learner and the employer.

   The student-learner should understand in the beginning that he is not going to be able to get off the job every time the school dismisses for any reason. His holidays for the job time should be those of the training agency and at the will of the employer.

5. That the parents are in no way relieved of any responsibility with regard to the personal conduct of the student-learner while in training.

6. That the student-learner can earn two units of high school credit each year in the program.

7. That the student-learner cannot spend more time in school than he does in employment.

8. That all the Child-Labor provisions under the Fair Labor Standards Act, where applicable, will be met.

N. Unusual Types of Placement

There are two other type placements which should be considered before leaving this chapter. First, in some cases a student may already be working in an establishment that can be considered a satisfactory training agency. In this case, if the student applies for admission to the program, the student can be transferred from the status of part-time worker to that of student-learner in a part-time, cooperative trade training

program. The coordinator must make it clear to the training agency that the student-learner is on a training program when he is enrolled in the Industrial Cooperative Education program.

The other type placement needs handling with extreme care. That is when an employer tells the coordinator that he wants to cooperate with the school and expresses his desire to train a student, and furthermore names the particular student he wants. That is very fine when the training agency is acceptable and the student satisfactory, but when either one or both are not desirable according to accepted standards, then the coordinator must summon all his tact and diplomacy and handle the situation so that no one will feel discriminated against, so that the program does not suffer, and so that everyone involved may remain friendly. How to do this: There is no set procedure other than to first see your advisory committee and proceed from that point with all caution.

Despite the importance attached to the placement of student-learners, the coordinator must recognize that placement is not his major responsibility, but that the most important phase of the program and his biggest job is related instruction.

O. Pre-Employment Information

If just before the student-learners go on the job, the coordinator will again assemble them for some pre-employment information, he will be curing some of his headaches before they occur. Pre-employment training consists of common sense discussions of "what to do" and "how to do it" in respect to contacts with the public; relations with fellow employees; learning and obeying shop rules, regulations and policies; proper dress and personal grooming for different types of jobs; together with similar items and anticipated problems.

In the conduct of an Industrial Cooperative Education program, every problem which can be anticipated and solved before it occurs is another big victory won on behalf of and by the student-learners, employers and the coordinator.

P. Employment Schedule

The coordinator may experience a little difficulty in working out the trainee's schedule on the job as some training agencies will prefer to have the students in the morning, others in the afternoon, and still others on Saturday or Sunday. Each individual trainee's schedule must of necessity be handled as nearly independently of all others or from any set procedure as is possible.

In certain cases, the employer will want to use the student-learner on Friday afternoon and sometimes all day Saturday. In such instances, the fact must not be overlooked that at these times everyone will be busy and the opportunity for training will be limited. Since the training is the principal objective of the program, provisions for training should be worked out whenever the student is working on the training program.

Q. School Schedule

There are a variety of plans, any one of which would be equally effective in the arrangement of the school schedule, and these will vary in each high school, dependent upon the length of each period, time of opening school and scheduled time for regular high school subjects. The principal point to be observed is that those student-learners in the course with junior standing should be assigned not less than two-hundred minutes per week of related subjects instruction, while those who enter the program as seniors must be enrolled for four-hundred minutes per week of related instruction, or be able to meet the requirements for one year programs which are prescribed in Chapter I - B. 2.

R. Schedule of Processes

For each individual student-learner, there must be prepared a schedule of processes to be learned on the job which will have to be worked out by the coordinator in cooperation with the employer. This schedule will be in the form of a job analysis of the phases of the occupation outlining the tasks, duties and responsibilities which the student-learner is expected to learn.

Training will be given in many occupations with which the coordinator is not familiar, and about which he will have to seek information. In practically all instances, he should endeavor to have a craft committee help him. This committee may consist of the employer or foreman and an employee in the establishment, or may consist of people engaged in the occupation other than within the training agency. In most cases, the employer should be encouraged to have a hand in working out the schedule of processes.

This schedule of processes may be in any one of a number of forms; but the three-column analysis will probably be found the most usable and convenient. The first or left-hand column contains a listing by units of the manipulative skills to be learned on the job. The related information which correlates with these job units appears in the second column. In the third column are references to specific books, magazines, etc., which indicate exactly where the desired related information can be found.

When the schedule of processes is completed, it becomes a part of the training plan.

S. The Training Plan

The training plan, or training agreement as it is sometimes called, is a vital and necessary part of the training program. It is through this training plan that the essential functions are outlined and agreed to for each person concerned. It includes the following:

1. Type of training to be undertaken.
2. Extent of the period of training and of the tryout period.
3. Provision for termination of student-learner.
4. Employment schedule for the week.
5. Schedule of compensation. This should be a graduated schedule.
6. Special provisions, if any.
7. Schedule of processes showing job training and outline of approved related instruction.
8. Provision for high school credit.
9. Type and degree of responsibilities of all parties concerned.
10. Signatures of employer, parent, student-learner and representative of the school.

On the following page there appears a sample training plan which has been found satisfactory. To this should be attached a schedule of processes which describes the specific on-the-job training to be given.

T. Approval of the Training Plan

Since the general advisory committee is a body representing the school and looking after the welfare of the program, it should approve each training plan after which it is signed by the coordinator as the representative of the school. The minutes of the committee meeting will show the committee's action on this matter.

The schedule of processes and the training plan should be worked up as soon as the employer agrees to train the student. There should be three copies of the training plan and schedule of processes for each placement -- one for the coordinator, one for the student-learner and one for the employer.

_____ High School

MEMORANDUM-OF-TRAINING PLAN

Date _____ 19___

I. The _____ will permit _____
(Student-Learner)
to enter their establishment for the purpose of gaining knowledge and experience as _____.
(Occupation)

II. The course of training is designed to run for a two-year period with a minimum of _____ hours per week required for the work experiences and at least one period in each school day required for the supervised and directed study of technical and related subjects.

III. The coordinators shall, with the assistance of the employer or someone delegated by him, prepare a schedule of processes to be learned on the job and an outline of related subjects to be taught in the school. These items to be made a part of this memorandum.

IV. The schedule of compensation to be paid the trainee shall be fixed by the training agency and the coordinator and shall become part of this memorandum, and a record noted on the back of this sheet. Such wages shall be comparable to wages paid apprentices and other beginners in the occupation in which the student-learner is engaged. They shall conform to the Fair Labor Standards Act of 1938, amended, if applicable.

V. The student-learner will not be permitted, in the process of gaining occupational experience, to remain in any one operation, job, or phase of the occupation beyond the period of time that is necessary

VI. The student, while in the process of training, will have the status of student-learner and will not displace a regular worker now employed.

VII. All complaints shall be made to and adjusted by the coordinator.

VIII. The parent or guardian shall be responsible for the personal conduct of the student-learner while in training.

IX. The employment of the student-learner shall conform to all federal, state, and local laws and regulations.

X. The employer agrees to instruct the student-learner in safety procedures and safe work practices in on-the-job training.

_____	_____
Coordinator	Student
_____	_____
Employer	Parent or Guardian

SAMPLE FORM

U. Insurance Coverage for Student-Learners

The brief statements which follow are intended to answer the often asked question of insurance for student-learners.

1. The student-learner is a bona fide employee, and therefore, must be covered by insurance.

2. The student-learner must be at least sixteen years of age to be enrolled in an Industrial Cooperative Education program.

3. Private insurance companies are not required to insure all persons sixteen years of age or over.

4. Any employer desiring insurance on an employee, but who cannot be accepted by a private insurance company, may receive such coverage by applying to the Workmen's Compensation Assigned Risk Plan which is administered by the State Industrial Commission, 160 North LaSalle Street, Chicago, Illinois 60601.

CHAPTER VII

RELATED INSTRUCTION

A. Importance of the Related Instruction Phase of the Program

An important and necessary facet of any program of Industrial Cooperative Training is the close and vital relationship which must exist between training on-the-job and education in school. The successful practice of hand or machine skills necessitates the acquisition of related basic concepts, technical information, theoretical knowledge and mathematical processes. These necessary adjuncts to the "doing" of the job are not readily conveyed to the student-learner by the trainer who generally lacks teaching skills. The productive time element involved coupled with the deficiencies in theoretical knowledge possessed by some trainers, precludes effective related instruction on-the-job.

The logical person to impart the various phases of related instruction is the teacher-coordinator.

The first thing that a coordinator must learn and establish in his thinking is that the program is not complete, nor can it be successfully operated without a properly functioning, vital program of teaching the related information applicable to the trade or occupation of each student-learner. This is the coordinator's major function.

For this purpose, the local board of education purchases and makes available for students the necessary technical information materials. The coordinator organizes these materials. The student-learners meet daily for one or more periods for the express purpose of assimilating the information. It is at this point that the coordinator assumes the task of guiding and directing the individualized study of each student-learner.

B. Methods of Presenting Related Material

The methods of presenting related materials are innumerable, and the coordinator should use the method best suited to put over the problem at hand. Assignments in textbooks, trade journals, etc., to be followed by written summaries, or oral reports is an effective method.

C. Specific Technical and General Related Information

The teaching and study of related information can be divided into two parts; namely, specific, technical related and general related.

Specific technical related instruction and study refers to the use of materials which are directly and specifically related to the job on which the student-learner is training. Through the use of textbooks, bulletins, plans, blueprints, workbooks and study guides the student-learner may be guided in his study of the specific technical related information applicable to his occupation. In the event involved technical questions or problems are encountered, solutions and answers may be sought from the respective employer-trainer. This work must of necessity be conducted on an individual basis, and should consume approximately 4/5 of the time spent in the related classroom each week.

General related instruction and study refers to the use of materials which deal with the abstract conditions and relationships of business and work in general. All student-learners can participate as a group in general related study. This phase may require about 1/5 of the time devoted to related instruction.

D. Outside Speakers

At intervals it is an excellent idea for the coordinator or a committee from the class to invite well-informed individuals in the community to come to the school and talk to the student-learners on particular subjects which are of interest and value to all. Such topics could be "The Value of Possessing a Good Credit Rating." Naturally, the secretary or manager of the local credit association is the logical individual for this talk.

A talk on the "value of money, how it works, and how to save it," would be an ideal subject for a banker. Another subject for a banker is "how to use the bank."

In like manner, trips could be made to industrial plants and commercial establishments where through observation and questioning much information of value to all may be obtained.

E. The Conference Method of Presenting Related Information

One of the very finest methods of presenting general related information is through the conference method. A topic or case study can figuratively be tossed among the student-learners and they can discuss it from every angle that comes to their minds. During the process of discussion, the coordinator should list on the blackboard each point as it is brought out by the group. When the points are exhausted, the group should study what is on the blackboard, eliminating the irrelevant ideas and consolidating the pertinent. In this manner, the group arrives at a definite conclusion concerning the problem which was discussed. On the next page is a listing of suggested conference topics together with box-head analysis headings.

TOPIC	BLACKBOARD HEADINGS
1. Competition (Employment, products, etc.)	Advantages-Disadvantages-How to meet
2. Orders	Why they go wrong - Remedies
3. Morale	Contributing Factors
4. Reports	Value - Whose Responsibility - Recommendation
5. Care of equipment	Items - Why Necessary - Who's Responsible - Cost
6. Wasted Materials or Damaged Goods	Who's Responsible - What Can Be Done
7. Promptness	Why Necessary - Suggestions
8. Sanitation	Value to Company - To men
9. Planning of work	Why Necessary - Suggestions
10. Loyalty	When Needed - How It Should Be Promoted
11. Health	Effect on Work - What Can Be Done
12. Personal Appearance	What Contributes - How It Affects Business
13. Good Speech	Why Necessary - Frequent Errors - Suggestions
14. Initiative	When Needed - Value
15. Effect of Slow Work of One Department on Another	Instances - Reasons - Improvements
16. Courtesy and Service	Case - What Driver Did - Result
17. Working Conditions Loading Conditions Parking Conditions	What - Effect - Suggestions
18. How To Increase Business	Case Discussion - Methods Used
19. Personality	Factors - What Can Be Done to Improve
20. Horseplay	
21. Labor Laws	Question, Discussion - Instruction
22. Handling Material	Errors - Causes - Remedy
23. Economy	What Economies Necessary - How to Get List
24. Duties and Responsibilities	
25. Customer Goodwill	How to Build and How to Hold
26. Advertising	Methods Company Uses - How Route Men Can Use
27. Fatigue	Effects - Suggestions to Avoid or Overcome
28. Rating Men	Why Worthwhile - How
29. Qualifications of a Foreman	List
30. Production or Plant Difficulties	Difficulty - Cause - New Plan

Additional topics suitable for the general related phase of class instruction could include the following:

The Industrial Cooperative Education Program and its Relation to Vocational Education
The Journey of Life
Keeping Out of Trouble
Steps to Success
Getting a Job and Growing Into It
Effective Study Habits
Working with Others
Employer-Employee Relations
Budgeting of Income
Saving and Investing
Credit and Money Management
Contracts
Legal Problems in Buying and Services
Paying Government Services Through Taxes
Social Security
Legal Relations for Young Workers
Labor Unions
Planning Your Career
Changing Jobs
Job Safety
Workmen's Compensation
Wage and Hour Laws
Fair Labor Standards
Unemployment Compensation
Income Tax Problems
Understanding Ourselves
Understanding Others
Leisure and Its Uses
Getting and Keeping a Job
Fringe Benefits
Insurance
Unions and Apprenticeship
Vocational Education
Industry in Our Economic System
Background of Organized Labor
Laws Governing Vocational Education
Character Building
The Consumer and Society
Labor and Our Economic System
Withholding Taxes
The Interview and the Personnel Director
How to Keep a Job
Union Organization and Management
What Makes a Good Trainee
Keeping Your Wage and Hour Records
Industrial Cooperative Education Clubs
Schools Rules and Regulations
Responsibilities of the Industrial Cooperative Education Student to School, Job and Employer
Roberts' Rules of Order
Making a Speech

F. Content and Plan for General Related Material

It is a very desirable practice for the coordinator to decide well in advance of each semester what items of general related material he plans for the group to study. The content of the instructional materials is to be selected on the basis of the objectives of the program and is the joint responsibility of the local board of education, the high school administrator and the teacher-coordinator. The separate accomplishments of the individual student-learners are to be recorded on a progress chart. As each task is completed, it can be so indicated by placing a grade or marking symbol opposite the student-learner's name and under the listing of the task or assignment.

G. Methods of Setting Up the Related Class

Another problem which must be worked out is provision for the related subjects class period in the high school schedule of classes. There are three possible methods for accomplishing

this. However, it behooves the coordinator and the high school principal to set up the period in the schedule which best fits their own inclinations, requirements and demands.

These are:

1. Have one related class period during which all student-learners meet at the same time, usually one of the lunch periods, thus providing for both the morning and afternoon student-learners.

2. Have two related class periods, dividing the group evenly by numbers, and providing for those students employed either morning or afternoon.

3. Have two related class periods, one composed of juniors and one of seniors. This method is recommended if the number of student-learners totals over twenty-four, and if the number of juniors and seniors are approximately equal.

Separate related subjects classes are required in those schools where Industrial Cooperative Education (D.O.) and Supervised Job Training programs are both operated under the direction of one coordinator.

H. Ordering Related Materials

When the coordinator is informed by the employer that he will train a student-learner, he should immediately work out with that employer the anticipated related technical needs of the student-learner, and from reliable sources purchase the necessary books, trade journals or other materials. It is recommended, however, that some money be reserved for the purchase of current trade information throughout the training period.

The coordinator will find it an excellent practice to order all related materials on approval. This is due to the fact that so many technical books, even though they are fine in every respect, are written on the college level, and thus, are not as useful as they might be otherwise. Without ordering on approval, the coordinator stands to waste a considerable amount of money.

I. Importance of Individualized Instruction

"The requirements of the various trades and occupations in the Diversified Occupations program are different. Likewise, the student-learners will differ considerably both in the rate and extent of learning ability. Furthermore, learning in the final analysis is an individual process and an individual achievement. In view of these facts, it is simply

futile to attempt to teach a class of student-learners in a dozen or more occupations at the same time by the group method. To be effective, instruction in Diversified Occupations must be individualized and the responsibility for learning placed squarely on the student-learner himself."*

The following outline indicates those activities and skills through which the coordinator will contribute to the effectiveness of the individual instruction:

Individual Instruction

What the Coordinator Does	What the Coordinator Needs to Know
1. Plan the Course of Study	
Make analysis Select units Prepare or select assignment sheets or study guides Secure materials Plan visual aids	Knowledge of trade and job analysis Knowledge of the basic information of trade How to organize materials Know how and where to secure materials How to prepare objectives Basic knowledge of distribution and merchandise
2. Make or Assist with the Selection of Assignments	
Check with employer Check with student Check work experience reports Make assignment clear Provide motivation	Public speaking Chart talks Knowledge of effective teaching procedures Psychology Knowledge of methods of selection of assignments Principles of learning
3. Assist Students with Problems	
Explain study procedures Help find material and information Check progress Keep students working Locate and define problems	Basic knowledge of distribution or industry Individual differences Study procedures
4. Set Up Grading System	
Evaluate completed assignments Determine grades Prepare and administer tests Prepare reports Keep progress record	Methods of measurements and testing Understanding short-comings of tests Understanding grading systems Understanding of ways to justify grades Techniques of evaluating work.

*Selvidge, R. W., and London, H. H., Essentials of Effective Teaching in Diversified Occupations. Unpublished Paper. Industrial Education Department, University of Missouri, Columbia, Missouri. 1939.

"This means that the coordinator must have in his classroom an adequate supply of well-selected instructional materials on each occupation represented in the program and have them so organized and arranged as to enable him actually to relate the work of the school with that done by each student-learner on the job. Although a difficult task, this must be done if the program is to fulfill the purpose for which it is designed. Many good instructional materials may be secured for the asking from the manufacturers and distributors of tools, machines, materials and other products. Some of this material may be "loaded" with advertisements, but most of it can be used to advantage for instructional purposes.

"Occasionally, the coordinator will find it advisable to have group discussion, or to give group instruction, concerning things of common interest to all the students in his class. These should be well planned and to the point for otherwise they will consume an unwarranted amount of time and accomplish very little. A good plan is to have individuals or groups investigate problems or topics of common interest and then present their findings to the class for further discussion. This places the responsibility upon the student and provides training in self-expression which is important. It also has a unifying and socializing influence on the group."*

Successful group instruction involves the following activities and "know how" on the part of the coordinator:

Group Instruction

What the Coordinator Does	What the Coordinator Needs to Know
1. Determine Group Needs	
Pupil-teacher planning Get recommendations of advisory committee Check analysis of all jobs Talk with individual employers Confer with other coordinators	Principle of learning based on needs and readiness Individual and group conference techniques
2. Preparation	
Secure material File instructional materials Make lesson plans	Sources of material Criteria for selection of material Principles of learning Methods of teaching
3. Instructional Procedures	
Orient students Secure speakers Conduct group conferences Lecture Use audio visual aids	Steps in teaching Laws of learning Teaching methods Speech

*Selvidge, R. W., and London, H. H., Essentials of Effective Teaching in Diversified Occupations. Unpublished Paper. Industrial Education Department, University of Missouri, Columbia, Missouri. 1939.

Direct committee and individual reports	Knowledge of merchandising subjects and business problems
Plan and direct role playing	
Give demonstrations	

4. Testing

Prepare tests	Types of tests
Administer tests	Grading systems
Evaluate daily work	Evaluation techniques
Prepare grades	
Record grades	
Evaluate instruction	
Follow-up instruction	

"Both industry and the school, as well as the home, must be concerned with the development of personal social traits for those are powerful "success factors" in both civic and occupational life. It is not enough to have a list of such traits: they must be made "objects of thought" or "conscious objectives" from day to day in the classroom and on the job. The coordinator must be ever on the alert to discover and correct any undesirable habits and acquired traits of his students. This calls for skillful and sympathetic counsel."*

J. Daily Class Procedure

It is imperative that each coordinator have a well-outlined method of daily procedure for his student-learners. A copy of this procedure should be in each student-learner's file for daily reference. The usual day-by-day conduct of the related subjects class follows somewhat along the following general line:

1. The student-learner goes to the filing cabinet and secures the active file or notebook. (The active file is for the purpose of keeping together all current assignments and work. If this creates congestion at the filing cabinet, the coordinator or some student-learner can place the folders on the table prior to the beginning of the period.)

2. Wage and hour reports are completed once each week. This should be done on Friday, if possible.

3. Check in the progress record all work done by the student-learner during the previous work period.

4. He then continues work and study on an assignment started previously or begins work on a new assignment on the basis of his needs as expressed by the report of work done on the job.

*Selvidge, R. W., and London, H. H., Essentials of Effective Teaching in Diversified Occupations. Unpublished Paper. Industrial Education Department, University of Missouri, Columbia, Missouri. 1939.

5. When a student-learner completes an assignment, he usually will have written work which must be checked by the coordinator. This completed work should be properly identified with job title, date and page number of the study guide. It should then be filled in the front of the student's notebook where it will be convenient for the coordinator to locate and check it.

6. After the coordinator has checked written work, it should be refiled in the student's notebook in the order found in the index of the study guide.

K. Training After Graduation

Throughout the school year the coordinator must constantly keep before the student-learner the fact that the worker who stops learning stops growing and ceases to be able to rise in his occupation.

This should be impressed upon the student-learner to the extent that for years after school days are over they will continue to learn. This process of learning on the part of the adult can be carried on by constantly reading trade journals and other trade literature which keeps the worker up-to-date in the trends of his occupation; by being eager to learn new processes and new methods of work in his occupation; by keeping in mind at all times that the worker who refuses to learn faces the probability of being replaced by a younger person whom the management finds it can train more cheaply and efficiently than it can retrain the old worker himself.

This topic can be summarized as follows: The journeyman who refuses to learn while on the job places himself in a position of finally being unable to learn and consequently faces replacement by a green hand who will and can learn.

It is assumed that each coordinator before going on the job will have taken a course in "Teaching Related Trade Subjects," so it is not necessary to further develop the problem of related teaching techniques in this guide.

CHAPTER VIII

COORDINATION, REPORTS AND RECORDS

A. Coordination

The dictionary defines "coordination" as a "combination in suitable relation so as to give harmonious results; functioning of parts in cooperation and normal sequence." In a program of industrial cooperative education, the role of the coordinator may be said to closely parallel this definition. The establishment, arrangement, operation and functioning of the various aspects of the coordinator's job are definitely intended to produce a suitable relationship or to give harmonious results. While certain functions of the coordinator's job involve activities within the school and classroom, it must be recognized that the activities conducted outside the school are of the utmost importance. In order that the coordinator may do the best job and achieve optimum results with each of his students, he must be constantly aware of the student-learner's successes and failures in his on-the-job activities. The coordinator must see to it that normal progression takes place; the acquisition of a complete and well-rounded series of manipulative skills must be assured; and these must be supplemented by general and technical information which will make the student-learner a competent and well-rounded worker. The instruction in school should be as closely related to the on-the-job experience as possible.

It is during the half-day employment period that the coordinator carries out his necessary out-of-school activities. He visits the training agencies, observes the student-learners at work, and confers with the employers and the individuals who have been assigned the responsibility of training the student-learners. The frequency of these coordination visits depends upon the particular situation. One or two visits per month should suffice except in those instances where the nature of the job, the abilities of the student-learner, and the operational problems encountered necessitate more frequent visitations.

1. Need for Coordination

Coordination as a function closely related to the operation of a program of industrial cooperative education is necessary to assure that certain essential objectives are attained. These may be stated as:

a. To prevent any possible exploitation of student-learners.

b. To determine progress of student-learners on the job.
c. To help solve immediate student-learner's problems which arise on the job.
d. To enable the coordinator to broaden his knowledge of job requirements and accepted standard practices.
e. To increase coordinator's ability to think from the employer's viewpoint rather than from an academic viewpoint.
f. To check on student-learner's work habits and attitudes.
g. To determine employer's and employee's reactions.
h. To promote cooperation of employees and employers with the school.
i. To secure stimuli for meeting related subject needs.
j. To establish and fix definite relationships of all agencies interested in the program.
k. To make school instruction functional in the daily life of the student-learner.
l. To create a friendly and sympathetic attitude.

2. What To Look For On A Coordination Visit

When making a coordination visit, the coordinator should note the student-learner's general bearing on the job, his dress, his grooming and his general appearance. If possible to do so, notice should be taken of the student-learner's attitudes and interests.

During the visit the coordinator should confer with the employer or trainer, and bring up for discussion one or all of the following items:

a. Meritorious achievements of student-learners on the job.
b. Student-learner's punctuality (check time card) and regularity of attendance.
c. Determine if student-learner is giving employer the quality and quantity of work which is deemed normal.
d. Student-learner's attitude toward his job, employer, co-workers, etc.
e. How the student-learner reacts toward criticism.
f. Find out what the student should be studying in the related class.
g. Student-learner's work habits -- does he follow directions; does he know how to care for tools and equipment.
h. Any physical problem the employer may have in routing the student-learner through the different job processes.
i. Determine what the employer and coordinator can do to prepare the student-learner for the next job change or advancement.

The tabulation which follows indicates the character and scope of the coordinator's job as he seeks to tie together the on-the-job experiences and the in-school instruction.

Coordination of Job Training

What the Coordinator Does	What the Coordinator Needs to Know
1. Evaluation of Student Progress	
Check with employer	Evaluation techniques
Check with supervisors and other employees	Grading systems
Secure student progress reports	Reasons for variation from normal systems
Secure reports on work habits and attitudes	Factors for determining job training grade
Check employer's and employees reactions	What employers expect of employees
Determine grade for job training	Knowledge of business language and jobs
Observe students at work	
Check with customers	
2. Correlation of Related Instruction and Job Training	
Check area of work student is doing	Principle of learning as information is needed
Obtain suggestions for information directly applicable	How to determine what is needed
Secure related information materials	Knowledge of business
Keep records of student's work	
3. Adjustments	
Secure all-around training	Wage and hour laws
Secure reasonable pay	Employer-employee relations and viewpoints
Counsel with students and employers on problems arising on the job and in school	School policies
Check working conditions	Counseling techniques
Help adjust all complaints regarding training program	Company policies
Visit parents	
Transfer or drop students	
Work out special holiday work schedules for students	
Promote cooperation between business and school	
Keep record of all visits	

3. Plan the Visit

The above list by no means covers the entire field of coordination. In fact it is next to impossible for the coordinator to make out a list of exactly what is to be discussed during a coordination visit. The best plan is to draw out the employer's thinking and work from that point. The coordinator should not misinterpret the above statement. Even though he does not know the exact direction the discussion will take, he must never enter a training agency without first having planned the visit. When a problem arises which could have been prevented by sufficient and proper coordination, the coordinator places himself in a position for censure.

B. Reports

1. The Semi-Annual Report or Organization Form

Since the salary of the coordinator of an approved program is partially reimbursed from State and Federal funds, it is necessary that reports be submitted to the State Office as evidence that the program is in operation and is being conducted according to the State Plan. The form T & I 25 which follows, constitutes the required semi-annual organization form. It will be noted that this sample form has been completely filled in so as to indicate how a satisfactory form should appear. Those schools operating a program of cooperative industrial education during the summer months will be required to complete a similar form to report the summer class and the students enrolled therein.

2. Code Numbers

For the purpose of properly reporting each occupation and the number of student-learners training therein, each occupation has been identified with a specific code number. It is suggested that coordinator consult the reference given at the bottom of form T & I 25, page 67c, or the condensed list of occupations which appears on the succeeding page.

3. Employer's Report on Student-Learner's Progress

It has often been said that a worker's value on any job consists of five elements: (a) manipulative skill, (b) mastery of related knowledge (general and technical), (c) ability to actually use the general and technical knowledge while performing the job, (d) ability to get along with people, and (e) job judgement and safety. These necessary elements should be natural outcomes of the program of instruction. To arrive at an evaluation of the degree to which the student-learner is attaining these essential on-the-job qualities, the assistance of the employer or trainer is obtained.

TRADE AND INDUSTRIAL EDUCATION
Semi-Annual Organization Report

Industrial Cooperative Education Program
Listing Students and Occupations

Please return TWO copies to:
Board of Vocational Education and Rehabilitation
Vocational and Technical Education Division
405 Centennial Building
Springfield, Illinois 62706

X FIRST SEMESTER; ___ SECOND SEMESTER; ___ SUMMER

Date October 1 19 65

Name of School Arcadia High School District No. 673

Address of School Arcadia, Illinois

Name of Principal Dr. John Jones

1. Related Class Information:

Value of related class reference books purchased during the past year $ 95.00

Number of different trades and occupations represented in this year's program 11

2. Course Information:

Indicate type of program: X Diversified Occupations ___ Supervised Job Training

Minutes per week related class is in session 275

The regular school year is 38 weeks in length.

3. Entrance requirements Sixteen years of age; junior standing; aptitude for the job.

4. Total number enrolled by grades in the industrial cooperative program:

	Below 9	Soph.	Junior	Senior	TOTAL
Male			7	5	12
Female			3	4	7
TOTAL			10	9	19

5. Program Standards:

The career objectives of all students enrolled must be a matter of school record.

Students must be employed for an average of not less than 15 hours per week.

The major portion of the students' time on the job must be during the hours of the regular school day. Any exceptions must be justified by the local school authorities.

Age certificates must be on file for all students placed in training on jobs classified as hazardous by the Child Labor Provisions of the Fair Labor Standards Act 1938, as amended.

A step-by-step training plan must be prepared for each student-learner.

A listing of students and enrollment data must accompany this form.

INDIVIDUAL TEACHER-COORDINATOR'S DAILY SCHEDULE
For an Industrial Cooperative Education Program

Name of Teacher Henry Parker

Indicate with a "V" under day of week, any free period devoted to class preparation, conferences, or supervision of vocational students.

(1)	(2)		(3)	(4)			(5)					
Period No.	Clock Time		Subject Taught or Activity Assigned	Enrollment			Place an "X" in the proper spaces					
				On-the-job		Classroom						
	Start	Close		AM	PM		Mon	Tue	Wed	Thurs	Fri	Sat
1	8:00	8:55	Industrial Arts			18	x	x	x	x	x	
2	9:00	9:55	Industrial Arts			20	x	x	x	x	x	
3	10:00	10:55	D.O. Related	10		10	x	x	x	x	x

1-32.10	Dentist's Assistants
4-76	Die Sinkers & Setters & Toolmakers
5-83.931	Diesel-Mechanics & Repairmen
0-48	Draftsmen
4-25	Dressmakers & Seamstresses
5-83.433	Electric Motor Repairmen
5-53	Electrician, Lineman
4-97.420	Electricians, Maintenance & Repair
4-97	Electricians, N.E.C.
4-97.010	Electricians, Wiremen
4-98	Electronic Manufacturing Occupations (Radios, Phonographs, etc.)
3-35	Farm Machinery Mechanics
5-99	Foremen & Supervisors
6-82	Foundry Occupations, N.E.C.
3-38	Landscapers & Nurserymen
6-78	Machine Operators (Machine Shop
4-75	Machinist
4-97.420	Maintenance & Repair Electricians
5-58	Meat Cutters (except in slaughtering & packing-houses)
5-83.941	Mechanic-Refrigeration & Air Conditioning
5-85.510	Mechanics-Auto Body & Fender
5-81.010	Mechanics-Automobile
4-23	Milliners
5-78	Millwrights
5-83.433	Motor Repairmen-Electric
5-83.111	Office Machines-Mechanics & Servicemen
4-84	Ornamental & Structural Metal Workers (Iron Workers)
5-27	Painters, Construction & Maintenance
0-56	Photographer (Commercial)
5-29	Plasterers
5-30	Plumbers, Gas Fitters, & Steam Fitters
2-38	Practical Nurses
4-44	Printing-Compositors & Typesetters
5-83.411	Radio & T.V. Servicemen
5-83.941	Refrigeration & Air Conditioning Mechanics
4-25	Seamstresses & Dressmakers
4-80	Sheet Metal Workers-Coppersmiths & Tinsmiths
4-84	Structural & Ornamental Metal Workers
4-26	Tailors, Garment Trade Workers
4-35.710	Upholsterers-Furniture
4-85.030	Welders, Acetylene
4-85.020	Welders, Arc
4-85.040	Welders, Combination

One report for which the coordinator is responsible, but which he does not make out is the employer's report on the progress of student-learners. These reports should be secured once during each grading period. Probably the best method of getting an accurate record of the employer's estimate of his student-learner is to present the report in person and talk with the employer about each item before it is checked.

Another method is to have the student-learner take the report to the employer and return it to the coordinator.

A third method that assures a fairly high percentage of return is to mail the report blank to the employer enclosing a stamped, addressed envelope for return, or pick up the report on a visit subsequent to mailing out.

Sample forms for the employer's report on a student-learner may be found on the pages which follow.

Reports relative to the student-learner's total training program are to be maintained by the school and are to be made available for purposes of program audit.

4. Special Reports

From time to time during the year special reports will probably be requested by the State Office. Whenever reports are made, a duplicate or summary should be filed with the administrator in charge of the school, and the coordinator must keep a copy for his own files.

C. Records

1. Training Plan and Schedule of Processes

Such records as the training plan and the schedule of processes for each student-learner are kept for recording the student-learner's progress in school and on the job, and a summary filed for a permanent record after the student-learner's graduation.

2. Attendance

The coordinator keeps a daily record of the student-learner's attendance at school and in employment. This can be recorded on the regular teacher's register used by the school.

RATING CHART FOR
INDUSTRIAL COOPERATIVE STUDENT-LEARNERS

Employer's Report of Student-Learner (On-the-Job)

A. Manipulative Skills
   1. Quantity of work done
   2. Quality of work done
   3. Job Know-how

B. Specific and Related Trade Information or Technology
   1. Trade Knowledge - Understands and applies subject matter

C. Personal and Social Qualities
   1. Reliable and dependable
   2. Attendance
   3. Thoroughness - has initiative and perseverance
   4. Cooperative
   *5. Ability to get along with others
   *6. Reaction to advice and constructive criticism
   *7. Personal appearance
   *8. Promptness
   *9. Accepts responsibility
   *10. Learns new work easily

D. Work Qualities and Habits
   1. Job judgment
   2. Use and care of tools and equipment
   3. Selection, use and care of supplies and materials
   4. Safe work habits
   *5. Follows instructions
   6. Has job confidence
   7. Making satisfactory progress

Additional Remarks

Coordinator's Evaluation of Student-Learner

1. Preparation of lesson assignments
2. Participation in class discussion
*3. Cooperativeness
4. Orderliness
*5. Thoroughness
6. Outside interests
7. Self-control
8. Leadership qualities and ability
*9. Making satisfactory progress
10. Effort put forth
11. Ambitions
*12. Ability to learn
*13. Ability to get along and mix with others
14. General attitude and conduct

*This identifies traits that are checked by both the employer and coordinator.

EMPLOYER'S RATING SHEET FOR STUDENT-LEARNER

1. Does the student show a willingness and desire to learn?
2. Is the student neat in personal appearance and work habits?
3. Is the student punctual?
4. Does the student apply himself to the job?
5. Does the student adapt to new situations easily?
6. Does the student work under pressure without becoming nervous?
7. Does the student have confidence in his or her abilities?
8. Does the student seem to be emotionally stable?
9. Does the student indicate initiative and ability to work alone?
10. Can the student be relied upon to do a satisfactory job?
11. Does the student have the friendship and respect of fellow workers?
12. Is the student willing to follow directions willingly?
13. Is the student willing to accept constructive criticism?
14. Is the student able to understand and carry out instructions?
15. Can the student work without constant supervision?
16. Does the student ask questions about things not understood?
17. Is the student a pleasant person to work with?
18. What do you consider are the weakest points of the student?
19. What do you consider are the strongest points of the student?

Please rate by a check mark in one of the spaces below, the STUDENT-LEARNER'S progress in job skills from beginning of the training period to the present time.

Rated by _____

3. Hours Worked and Wages Earned

Each student-learner keeps a weekly record of hours worked and wages earned. These records are compiled by the coordinator at the end of each calendar month and the information on these is incorporated in the semester reports. A sample form follows on the succeeding page.

4. Grades and Achievements

The coordinator keeps a record of the grades and achievements earned by the student-learners from day to day, so that he will have a basis for assigning grades at the end of the school's regular grade report periods. The coordinator should also keep a complete record of the student-learner's grades earned in academic classes. Often the coordinator finds himself in a position to aid a student-learner whose grades are slumping. Some coordinators even contact the other teachers for the purpose of finding out how his student-learners are getting along in their class work and offering to do anything he can to aid those teachers in any problem they might have with an Industrial Cooperative student-learner.

5. Follow-up Survey

Each year the coordinator must make a follow-up survey of all the program's graduates to determine where they are, what they are doing, and how much they are earning. The coordinator should have a system of records to keep the follow-up of students for at least five (5) years. A form for reporting is mailed to the coordinator each year. A sample form follows on the succeeding page.

Briefly stated, the items which follow indicate how the coordinator secures this information and summarizes and interprets the data:

What the Coordinator Does	What the Coordinator Needs to Know
Prepare and mail questionnaires	Type of information needed
Interview graduates and former students	Methods of making follow-up studies
Set up permanent records and record data	Purposes of follow-up
Summarize data and prepare report	Principles of summarizing and interpreting
Revise course of study	
Assist graduates with problems such as placement, additional instruction	
Interpret report to public

3.			

How many times did you meet with this committee last year? _____

INSTRUCTIONS

1. Fill out the Follow-up Record forms and return one copy to the State Board of Vocational Education and Rehabilitation.
2. Keep one copy for your files. You will need this record for future follow-up studies.
3. Under "A", list the names of your present Vocational Advisory Council.
4. In the first column of "B," list the names of students who graduated this past June. In the second column, list the occupation for which the student was trained. Following each name, list the specific job title for which the graduate was engaged in as of October 1.
5. Please return no later than December 15, 19 __ __

(SEE PART "B" - OVER)

EMPLOYMENT FOLLOW-UP RECORD
for
INDUSTRIAL COOPERATIVE EDUCATION GRADUATES

B. EMPLOYMENT RECORD

Graduate's Name	Occupation for Which Trained	Employment as of October 1, 19__ __ (Specific Job Title)

6. Coordination Visits

A record which the coordinator must make and keep is that of his coordination visits. A very simple form for a daily recording of these visits follows:

Record of Coordination Visits for _____, Student-Learner

Employed at _____ as a _____

Date	Person Contacted	Results of contact

7. Student's Record File

Good record keeping is a necessary part of every program. Careful, legible and comprehensive records, regarding every student enrolled, require that the coordinator regularly apply himself to this task. A letter-size manila folder for each student-learner, bearing his or her name, will permit keeping together all of the individual student's records, and readily accessible. Each folder should include the following records and forms pertaining to the student:

a. Application and personal data
b. Rating scale
c. Interview memos
d. Training plan
e. Job analysis
f. Student-learner wage certificate
g. Weekly progress charts
   (1) On-the-job processes completed or skills acquired
   (2) General and specific technical related information completed.
h. On-the-job processes completed
i. Technical related topics completed
j. General related topics completed
k. Hours worked
l. Wages received
m. Coordination visits
n. Grades on the job and in school
o. Follow-up information

Much of the above information will be needed for periodic reports to the advisory committee, to the administration and to the State Office.

8. Monthly Report of Coordinator's Activities

This report is intended to convey to those persons and agencies concerned a summary of the coordinator's activities during each calendar month. It should be submitted by the fifteenth (15th) day following the end of each month.

a. Purpose of Report

   (1) To present the scheduled activities of the coordinator
   (2) To keep school administrators informed of the coordinator's activities
   (3) To keep the State Office informed

b. Content of Report

   (1) Where you make calls (T.S.V.)
   (2) Who you contacted on calls
   (3) Objectives for the calls
   (4) What you accomplished

The report should be as brief as possible, yet give all the information that is necessary.

The various items which appear in the report are classified into eleven different categories, each indicated by a code number. These are as follows:

(1) Coordination - Any call not covered by the other ten items.
(2) Instructional Materials - Grading lesson sheets, gathering new materials, library work, working on study guides and general related information. Contacting guest speakers for the general related class work.
(3) Promotional - Any activity that is used by the coordinator to secure training stations or to promote student interest in the program.
(4) Public Relations - Any activity or device which has for its purpose to create a favorable impression of the Industrial Cooperative Education Program.
(5) Guidance - Any activity which has as its purpose the personal adjustment of the individual in social, economic and vocational understanding.
(6) Administrative Contacts - Any contact with the local school administration relative to the Industrial Cooperative Education Program.
(7) Advisory Committee Activities - Contacts with advisory committee, group or individually.
(8) Club Activities - Any club activity that involves the Industrial Cooperative Education Program.
(9) Labor-Management - Purposeful contacts with organized labor-management that concern the Industrial Cooperative Education Program.
(10) Home Visitations - Any contact with the parents, preferably with one or both at the home.
(11) Other - Self-explanatory.

Whenever the activity justifies, two or more code numbers may be used to properly identify an activity. Example - (3-4-9). However, such combination coding should be held to a minimum.

Place a check in the square after Industrial Cooperative and directly below initial "D.O." for Diversified Occupations or "S.J.T." for Supervised Job Training.

If yours is an Interrelated Program, include the word "Industrial" above Interrelated and check the Interrelated square.

One copy of the report should be given to the local school administrator and one copy should be sent to the State T & I Supervisor. Retain one copy for the coordinator's file.

Send two copies of the report for the Inter-related classes to the Board of Vocational Education and Rehabilitation.

Use one line per trainee - List the date and code number which refers to the eleven activities described at the bottom of the form. In the third vertical column, please list only the trainee's name and occupation. Do not list employers, trainers or advisory committee members.

You will also note there is a place at the bottom of the form for your mileage. Please indicate number of miles traveled during the period of this report.

Since the coordinator is not working entirely within the school, a written report serves as a protection if anyone should challenge the work that has been done.

A sample filled-in report follows.

MONTHLY REPORT OF COOPERATIVE TEACHER-COORDINATOR'S ACTIVITIES

INDUSTRIAL COOPERATIVE ☒ D.O. INTERRELATED ☐ HOME ECONOMICS ☐ AGRICULTURE ☐

NAME OF SCHOOL Arcadia High School MONTH November 19 65

Date	Code	Student's Name and Occupation	Comments Describing Activities and Accomplishments
11-1	1 (T.V.S.)	John Benton (Auto Mechanic)	Discussed job progression of student-learner with Mr. Walsh, trainer. Student is exposed to a variety of jobs. He is accepted by other employees and shows much interest and enthusiasm.
	5	Harvey Drifus (Draftsman)	Harvey's previous school drafting room experiences are helping him. Both employer and I are directing his occupational goals toward designing.
11-2	2	----------	Worked on related materials including visual aids in area of Plastics.
	3	----------	Visited Baxter T.V. Service re: Training station next fall. Interested.
	10	William Harper (Meat Cutter)	To establish contact with parents and inform them of Bill's progress an evening visit was made. Parents pleased with Bill's changed attitude.
11-3	6	----------	Conference with Mr. Harkins, Principal, to report on program status and outlook for next semester.
	4	----------	Sent article and photos of students on-the-job to Daily Chronicle.
	1 (T.V.S.)	Emory Reeves (Tool & Die Work)	Emory has completed prescribed time on drill press and lathe. Next phase (shaper) discussed with trainer, Mr. Boyd. He will begin shaper work next week
11-4	8	----------	Weekly meeting of I.C.E. club. Much student enthusiasm regarding participation in forthcoming State Convention.
	1,2 (T.V.S.)	Bernard Johnson (T.V.-Radio)	Bernie's progress is good at Acme Radio and T.V. Service. Mr. Phelps, trainer assisted me in securing specific related materials which we will use in class.
11-7	7	----------	Advisory committee meeting well attended. Members indicated possible future work stations to be contacted. They will attempt to secure related materials for two occupations for which sources are limited or unknown to me.
	11	----------	
11-8	9	----------	Discussed pre-vocational training and role of industrial cooperative education with Mr. Dunlop, Business Representative of Sheet Metal Workers' Union.
	1 (T.V.S.)	Joann Perkins (Dental Assistant)	Dr. Walters pleased with Joann's progress. She will receive prescribed wage increase shortly. She is careful, neat and willing worker.

CHAPTER IX

ADVISORY COMMITTEES: THEIR ORGANIZATION AND FUNCTION

A. Need for Advisory Committees

Each industrial cooperative education class shall have an advisory committee functioning in the best interests of the program. The program of instruction should be developed and be conducted in consultation with potential employers and other individuals, or groups of individuals, having skills in and substantive knowledge of the occupation or occupational field representing the occupational objective.

B. Kinds of Advisory Committees

A carefully selected representative advisory committee is necessary in an Industrial Cooperative Education Program and must be used by all coordinators. The advisory committee, if carefully selected and the meetings well-planned, can be of unlimited assistance to the coordinator in that it will give him a group of interested employers and employees to whom he can go for counsel and advice in the operation of the program. Each coordinator will want a general advisory committee which will function throughout the year to guide the entire program. In addition, he should organize a number of occupational (trade or technical) advisory committees to aid in the organization of instructional material for their specific occupations.

The superintendent should designate the advisory committee upon the recommendation of the coordinator. If possible, the committee should be named at least two weeks before school opens. Much depends on the coordinator. He must go out into the community to make the necessary contacts and make himself known. This can be done during the month of August. Before contacts in the community are made, the coordinator should discuss his plans with the superintendent, explaining in detail his total approach to the problem.

C. Purpose and Duties of General Advisory Committee

1. To advise and guide the coordinator in setting up, carrying on and improving the program.

2. To help determine various occupations in which there is a definite need for training.

3. To assist in job placement - selection of firms or employers.

4. To assist in selling the program and in keeping it sold.

5. To approve content material for courses.

6. To assist in the selection, placement and follow-up of trainees.

7. To determine objectives of each course in view of program policies.

8. To assist in obtaining the cooperation of labor, the employers and the school.

9. To recommend necessary facilities, materials and supplies.

10. To recommend personnel for occupational advisory committees.

11. To assist in maintaining high standards.

D. Personnel of General Advisory Committee

1. Should contain an equal number of representatives of employers and employees, service groups and lay people.

2. Should be a person from all groups in town with a minimum of four persons, and also should have authority to act for the group he represents; be selected from the group and not handpicked by coordinator.

3. Suggested numbers and occupational fields:

   a. Employers: Two to four, each of whom is preferably from a different occupational field, such as manufacturing, contracting and banking.
   b. Employees: Two to four (in any case the same number as "a" each of whom is preferably from an employee group, being sure to include organized labor, if such exists.

   The representatives of labor may be:

   (1) Business Agents of Local and District Lodges
   (2) Presidents of local lodges
   (3) Elected members of a local lodge
   (4) Joint apprenticeship committee members.

4. Method of appointment

   By the superintendent of schools after consultation with the local director of vocational education and/or coordinator.

5. Basis for selection

   a. Leadership in some occupational group, such as Trades and Labor Council, Association of Manufacturers.
   b. Designated representative of some occupational group, such as Chairman, Educational Committee; Chairman, Apprentice Training Committee.
   c. Representative of some civic groups interested in vocational training (who is also an employer), such as Chairman, Kiwanis Guidance Committee; Chairman Rotary Youth Service Committee; etc.
   d. Civic leader (usually employer) who has been active in supporting the educational system, vocational training, service to under-privileged groups and similar movements.
   e. Civic leader, man or woman, who has evidenced a special interest in the program and has volunteered to use influence in every way to support the movement.

6. Term of Office

   a. May be appointed for one year.
   b. May be reappointed annually, or new appointments made as officials change in various groups from which representatives have been secured.

7. Organization within the committee

   a. Chairman selected by vote of the committee
   b. Secretary, Coordinator of Industrial Cooperative Program (ex officio) or City Director of Vocational Education (if such exists in system).

8. Meetings

   a. Time: At periodic intervals, preferably one a month.
   b. Place: Convenient to majority.
   c. Notification: By secretary by mail with probably phone reminder.

E. <u>Purpose and Duties of Occupational Advisory Committees</u>

1. To advise and guide the coordinator in setting up, carrying on and improving the training program in some specific occupation, trade or craft, or in a group of closely allied occupations.

2. To assist in making and checking schedules of processes to be followed by the student-learner

3. To approve entrance requirements and assist in selecting student-learners for specific occupations.

4. To assist in preparing and selecting related instructional material for specific occupations.

5. To recommend necessary reference materials and supplies.

6. To assist the coordinator in securing apprentice recognition for student-learners in specific trades.

7. To advise the coordinator as to numbers needed and opportunities for employment.

8. To explain and defend the operation of the program as it affects a particular trade or craft.

9. To assist the coordinator in establishing and maintaining fair and equitable wage scales for student-learners.

10. To assist in maintaining high standards in all essential phases of the program.

F. Personnel of Occupational Committees

1. Should contain at least an employer and employee from a single occupation, trade or craft.

2. Method of appointment:

   No official appointment to be made. The coordinator secures cooperation of the employer and employee-trainer or others in the occupation that may be helpful.

3. Basis for selection

   a. Knowledge of the particular field of work in which training is contemplated.
   b. Influence with employees and employers in the field.
   c. Willingness to devote time to assisting coordinator in developing and checking schedule of training, job analysis, assignments for related study and listings of related technical information.

4. Term of office:

   As long as needed.

5. Organization within the committee

   The coordinator will serve both as chairman and secretary, unless the committee is a large one, in which case a chairman should be selected by the committee.

6. Meetings

a. Time: At time most convenient to members as ascertained by the coordinator.
b. Place: Convenient to majority.
c. Notification: By personal contact or by telephone.

G. Points for Success in Committee Meetings

1. Help the chairman to conduct meetings in a businesslike way.

2. Be prepared for problems which may arise (have agenda prepared).

3. Don't waste time. (Remember these are busy men who are giving you their time.)

4. Encourage short, snappy meetings.

5. Know your committee -- get acquainted with them individually.

6. Present every question or issue as clear-cut as possible.

7. Have outlines, suggestions, etc., duplicated and distributed for each committeeman's study and consideration.

8. Take notes and write minutes for later distribution.

9. Promote a feeling of ease, see that each member meets every other member and is informed as to what group he represents.

10. Endeavor to meet them on the level of cooperative enterprise.

11. Ask for suggestions, comments, and criticisms about the program, work of the department, outlines, etc. Adverse criticism often does us all good.

12. Be prompt, be on hand and start at appointed time.

13. Explain clearly and definitely what you are trying to do.

14. Extend equal courtesy to members of all occupational groups.

15. Refrain from any comments which might offend a sensitive person.

16. Meetings held at a time when a meal can be served tend to make the group more congenial and frequently make a better attendance possible. However, when this is considered, the item of cost or paying for the meal must be faced, which will be handled differently in different communities.

H. Dangers and Difficulties

1. Committeemen may not be in complete accord with work.

2. Committeemen may get to exchanging remarks about things other than for which the meeting was called.

3. The discussion wanders.

4. Members are not made to feel at home or free to discuss the current problem. (Hold meetings where the committeemen can smoke if they desire.)

5. The committee is out of balance.

6. Some one or two members try to dominate all the discussion.

7. The meeting drags out over an unnecessarily long period.

8. The meeting is held just before meal time.

9. The members are not made to feel that they are contributing something for the betterment of the program.

I. First General Advisory Committee Meeting

It is vitally important the first meeting of the General Advisory Committee should be directly to the point without any loss of time. It should be well-planned by the coordinator, who should have an agenda at hand and follow it carefully.

J. Preparation for An Advisory Committee Meeting

1. Before Meetings

a. Prepare an agenda for each meeting, outlining the topics to be discussed.
b. Notify members at least one week in advance.
c. Agenda should be in their hands at least two days in advance of meeting.
d. Phone members of committee during afternoon of meeting to remind them. These people are busy and could forget.
e. Length of meeting should be limited to two hours, if possible.

2. At Meeting

The coordinator assumes the temporary chairmanship (until the committee itself elects its chairman) and explains the program and the purposes of an advisory committee. The committee should be organized before the close of the first meeting. The coordinator brings up as many of the following items of business as there is time to discuss, reserving the leftovers for the next meeting:

a. Give a list of the training agencies. (These should be typed off and a copy handed each member.)
b. Ask for additional training agencies. (Probable)
c. Discuss problem of transportation, if any exists.
d. Explain trade journals, manufacturers' leaflets, catalogues, check sheets, monthly services, handbooks, current magazines, and other related materials.
e. Ask them to save for you any materials that they may have; get a listing of materials that they may furnish and when you get it, ask that they request such materials from others.
f. Explain the high school schedule. (Hand out prearranged copies to each member.)
g. Explain difference between general and technical related materials.
h. Tell what a coordinator will look for on a visit, as:
   (1) Look for good things pupils achieve on job.
   (2) Student's punctuality - check time card.
   (3) See if student is giving employer a full half-day's work.
   (4) Check on student's attitude toward his job, employer, co-workers, and the public or patrons.
   (5) How does the student react toward criticism.
   (6) Attitude toward help and instruction.
   (7) Student's attitude when praised.
   (8) Get report from employer about student's work habits -- does he follow directions; does he know how to keep busy; does he know how to care for tools, equipment, etc.
   (9) Find out what you or the employer may do to prepare the student-learner for the next job advance.
   (10) Any physical problem that employer may have in routing the student through the different processes.
   (11) Ask the committee for additional things for which you should look.
i. If the question of paying less than minimum wages is brought up, show and explain an exemption certificate, recounting the problem involved in obtaining one.
j. Explain about the training plan and the schedule of processes.
k. Try to get them in sympathy with the young worker.
l. Explain to the committee that it is the coordinator's duty to help trainers in methods of teaching.
m. Discuss the importance of safety on the job, importance of employer's discipline and eternal diligence on the part of the student-learner.

K. <u>Subsequent Meetings of Advisory Committee</u>

1. Call to order by chairman.

2. Secretary read minutes of last meeting. (Do not have to be approved.)

3. Report of coordinator on activities since last meeting.

4. Comments from superintendent.

5. Comments from members of Advisory Committee

6. Report of progress of students at each training station.

7. Old business from last meeting.

8. New business and plan of action.

9. Adjournment.

L. Minutes of the Meeting

After the meeting, return to the school and write up the minutes of the meeting, and within the next few days send a copy to each member of the general advisory committee.

Meetings should be held whenever needed with a minimum of two a year. The Coordinator or Local Director of Vocational Education is secretary. This group has no legal authority, just advisory. All results of meetings should be kept confidential to the group. It is better to postpone a meeting rather than not have organized agenda.

Summary of Coordinator's Responsibilities For An Advisory Committee

What the Coordinator Does	What the Coordinator Needs to Know
1. Organization	
Select names to submit for appointment on committee Submit names to superintendent and principal for selection and appointment by school board Act as chairman until chairman is elected Explain cooperative program to committee	Types of advisory committees Characteristics necessary for committee members Membership of committee Procedure for selecting members How to conduct a meeting Why have an advisory committee
2. Operation of Committee	
May serve as secretary to group Bring to attention of members matters pertinent to program Keep progress report for committee Help chairman plan meetings	Duties of secretary of committee Understanding of part-time program Understanding of duties of advisory committee How to prepare agenda

CHAPTER X

PROGRAM EVALUATION IN INDUSTRIAL COOPERATIVE EDUCATION

Evaluation of the program of instruction will be made periodically at the state level, and continuously on the local level, with the results being used for necessary change or improvement through experimentation, curriculum improvement, teacher training and other means.

Following you will find a series of statements. Each statement indicates a condition or provision essential (or at least desirable) for a functioning program.

The criteria which follows is intended for use in a self-evaluation of your program. Please fill in each blank with your rating. Also at left of each blank check the items that would help you if discussed at a workshop.

Evaluation each statement on the basis of personal judgement and also all other available evidence, using a five-point rating scale as follows:

5. Provision or condition is present and functioning almost perfectly.
4. Provision or condition is present and functioning very well.
3. Provision or condition is present and functioning fairly well.
2. Provision or condition is present and in an inadequate amount, or if present, is functioning poorly.
1. Provision or condition is very poorly met or not present at all.

I. TRAINING PLAN

_____1. Are properly signed and filled out by the required persons.

_____2. Are dated.

_____3. Are properly understood by all parties concerned.

_____4. Are up-to-date in their requirements.

_____5. Have a schedule of processes included or attached.

_____6. Provide for one period of related study daily.

_____7. Include approved wage schedule.

_____8. Are provided for all involved parties.

_____9. Clearly state work hour requirements (conform with State Plan of Vocational Education).

_____10. Include provisions for termination.

_____11. Conform with local, state and federal labor and employment laws.

_____12. Clearly state occupation or trade to be learned.

_____13. Specify that high school credit will be granted.

_____14. Provide for on-the-job supervision of the student-learner.

_____15. Have an outlined course for related instruction included or attached.

_____16. Clearly state the status of the student-learner.

II. SCHEDULE OF PROCESSES

_____1. Are based on the analysis of the occupation.

_____2. Have been developed and approved by an occupational or craft advisory committee.

_____3. Have adequate provision for keeping progress records.

_____4. Provide proper type of work experience and are designed to cover training period.

_____5. Provide an explanation to the effect that the training period does not encompass full training in those occupations requiring a training period in excess of 2,000 hours.

III. OCCUPATIONS INCLUDED IN THE PROGRAM

_____1. Are clearly defined and stated according to dictionary of occupational titles.

_____2. Require a minimum of one year of training.

_____3. Provide opportunity for employment after training.

_____4. Are socially desirable.

_____5. Meet the ethical and social standards of the community.

_____6. Are trade or industrial.

IV. TRAINING AGENCIES

_____1. Have adequate equipment and facilities to afford an all-round training.

_____2. Including employees, understand the objectives of the program.

_____3. Are within a reasonable distance from the high school or adequate transportation is provided.

_____4. Designate a particular qualified person to train the student.

_____5. Have satisfactory business and ethical standing.

_____6. Comply with all safety and health regulations.

_____7. Anticipate retaining the students after graduation.

_____8. Do a sufficient volume of work to enable students to receive reasonably continuous training.

V. RELATED INSTRUCTION

_____1. Material and equipment is organized to permit efficient pupil use.

_____2. Schedule has been developed with the aid of a craft committee and is based upon the schedule of processes.

_____3. Is kept up-to-date.

_____4. Material is sufficient.

_____5. Is organized on the student-learner level and is in keeping with the training period.

_____6. Is correlated with work experience.

_____7. Includes general related subjects which are applicable and satisfactorily taught.

_____8. Schedules are planned to produce best "pupil efforts."

VI. STUDENT SELECTION

_____1. Made out on the basis of the following:

a. Entrance age requirements
b. Job requirements
c. Pupil interest and known abilities
d. School record to date

_____2. Program provides adequate advice and counsel concerning the occupation.

_____3. Made after counseling with parents.

_____4. Program provides that the coordinator shall check the prospective pupil for "sincerity of purpose."

_____5. Program is well-planned and organized.

VII. COORDINATOR

_____1. Visits training agencies on basis of needs.

_____2. Visits training agencies frequently enough to maintain good relationship.

_____3. Possesses training experience and personal qualifications to enable him to perform his duties effectively and efficiently.

_____4. Maintains contact with the parents.

_____5. Maintains acceptable civic and social relationships in the community.

_____6. Has two or more meetings with the advisory committee.

_____7. Conducts the program as an integral part of the school system.

_____8. Maintains cooperative relationship with the school faculty.

_____9. Keeps accurate check on student job progression.

_____10. Has sufficient knowledge of labor and employment laws.

_____11. Maintains an adequate follow-up and permanent record system.

VIII. PUBLIC'S ATTITUDE

_____1. Organized labor in the community approves the program or is kept well informed.

_____2. Civic organizations are in sympathy with the program.

_____3. School officials, principals, and teachers endorse the program.

_____4. Industry as a whole cooperates with the program.

_____5. Newspapers are disposed to give favorable publicity.

_____6. School patrons understand clearly the objectives of the program.

IX. ADVISORY COMMITTEE

_____1. Participate in the operation of the program to a satisfactory degree.

_____2. Is proportionately representative (employer, labor).

X. MISCELLANEOUS

_____1. Provison has been made to permit graduation from high school in the usual period.

_____2. School administration provides adequate funds to purchase the necessary equipment and instructional material.

SUM TOTAL OF ALL RATINGS

Scores 280 and above indicate Superior program.
Scores between 215 and 279 indicate Average program.
Scores below 215 indicate Below Average program.

During periodic visits to the program the State Supervisor shall make a similar evaluation using the outline form which follows:

INVENTORY OF INDUSTRIAL COOPERATIVE PROGRAM

OF _____ HIGH SCHOOL

Date _____ Coordinator _____ copies for: Superintendent, Principal, Local Supervisor, Coordinator. Was there a conference concerning this inventory _____ with _____.

It is the intent of this work sheet to commend excellence and also indicate a need for improvement. It is also the purpose of this program review to point out the needs for providing the best possible training for the youth participating in the Industrial Cooperative program.

These evaluations are based upon my judgment and make no reference to persons or personalities involved. The following are accepted criteria for the maintenance of a satisfactory Industrial Cooperative Program.

Some suggestions regarding conditions that were apparent at the time of my visit: _____ State Supervisor.

Section A.

1. Classroom facilities _____

_____

_____

2. Class and Program Recordkeeping - Trainee - Coordinator _____

CHAPTER XI

AIDS FOR THE COORDINATOR

While carrying out his responsibilities, the coordinator encounters a wide variety of questions, problems and situations for which he may not have ready solutions. It appears worthwhile, therefore, to incorporate in this chapter information which may be helpful in such instances. What follows is not meant to be an integrated discussion along the lines of a single subject. It is placed here with the hope that each new coordinator can turn to it for help on the job, and that experienced coordinators will use it to stimulate their thinking when dealing with a problem.

A. Organization of Related Materials

All books should be stamped with an identifying mark and placed in book cases or shelves in the classroom according to trade content. It is a very good practice to secure the aid of the school librarian in making and ordering selections, cataloguing, card indexing, and in arranging books on the shelves.

All magazines, pamphlets, bulletins, catalogues, newsletters, etc., should be filed in some manner. An excellent and highly facile system is to put each piece of this related materials in a heavy manila envelope and place them on shelves. The coordinator will find that about four sizes of envelopes will accommodate all such material. When an envelope is placed on file, it should be marked with an index number of symbol and a 3 x 5 card prepared on which is written what information is in the envelope and also having on it the index number which corresponds to that on the envelope. These 3 x 5 cards should be filed under occupational heads. The student-learners can easily make filing envelopes from a roll of 60 lb. kraft paper.

Magazines and trade journals, while current, should be displayed on magazine racks.

The coordinator must set up some method for filing the great amount of paper work that is done in the related class, together with training plans, schedules of work processes, employers' reports, monthly reports, etc.

This should be worked out to suit the individual case, but nothing in the way of records, reports or correspondence should go out without a copy for filing.

B. Study of Unrelated Subjects

An undesirable thing which can creep into the related subjects class is the preparation of regular school assignments. This comes about mainly from the lack of anything to do and the burden lies with the coordinator in supplying sufficient assignments and related material to keep the student-learners busy at all times.

C. Grades and Grading

Coordinators should guard against permitting student-learners attaining high grades too easily. A great amount of superior work in the related classroom should be produced, together with a most excellent rating from the employer, before a student-learner should be graded A.

The coordinator must demand a large quantity of high quality work and keep a complete record of each grade or symbol earned. He must also secure ratings from the employers to aid in assigning grades.

D. Prospective Student-Learners Unplaced When School Begins

In a few cases, there will be a few prospective student-learners of superior quality who have not been placed in training agencies when school begins in the fall. Do not permit these students to carry only two regular subjects and meet the related class pending placement. Have each unplaced prospective student-learner register for and begin meeting four regular-type classes. If, in a few days or a week, he can be placed, remove him from two of his regular classes and shift him to the related class. Much less damage is done by this than to permit him to miss two weeks or so of regular classes, and sending him to other teachers when realizing the inability to place him. The same procedure may be used if the student-learners sixteenth birthday falls between the third and fourth week of school.

E. Letters

All correspondence should be on stationery with a letterhead which definitely identifies the high school. The coordinator may be requested to prepare letters for the signature of other school officials.

F. Bulletin Boards

The related classroom bulletin board is an important teaching device and should not be overlooked by the coordinator. A very effective method of using the bulletin board is to divide the class into committees of three members each, assigning each committee a definite week to be responsible for the bulletin board. If the membership of the individual committees should be composed of student-learners in the same or related trades, the bulletin board would probably present a very interesting point for competition in its preparation.

Never permit an item of information to go on the bulletin board unless it is explained to the group by the committee or individual placing it there. Also, the posted materials should be neatly arranged, presenting a planned, orderly appearance.

Above all things, change the bulletin board at least once each two weeks. There is nothing to be found more bleak and drab than a bulletin board with material posted on it four years old.

A fine project for the class is to secure space on the bulletin board in the main corridor of the school. Let committees keep this space current and containing materials both informative and entertaining. No better device for selling the program and keeping it before the school has been devised than the well-kept corridor bulletin board.

G. Student-Learner Appearance

Every coordinator must take it upon himself to see that his student-learners come to school in the very neatest and cleanest of clothes. It costs little to be neat and clean, and the class can quickly gain for itself favorable notice and reputation.

If a full-length mirror can be placed by the door, so that every student-learner will see himself as he leaves the classroom, the effect will be good. A neatly lettered sign over the mirror, "This is how I appear to others," will be helpful.

It is the coordinator's duty to do what he can to dignify labor. If the school's only working group is the nicest looking in school, much has been done toward that end. It costs little and pays dividends for a boy to wear a tie to school, for a girl to do just a little extra to appear a little neater.

H. Student-Learner Absences

If at any time it becomes necessary for a student-learner to be absent from his job, he must contact his employer as well as the coordinator and secure permission to be absent. If it is a case of illness, both should be notified as early as possible.

I. Wage-Hour Exemption

1. An employer engaged in interstate commerce or in the production of goods for interstate commerce operating under the provisions of the Fair Labor Standards Act of 1938 as amended, may train a student-learner and pay him an average of seventy-five percent of the statutory minimum wage.

2. Application for a special student-learner certificate can be secured from the U.S. Department of Labor, Wage and Hour and Public Contracts Division, 219 South Dearborn Street, Chicago, Illinois 60604. Applications should be ordered early in August as employers are to file an application 15 to 30 days in advance of the student-learner's beginning date of employment. The application is relatively east to fill out. Just be sure to fill in every blank.

The original and one copy of the completed application on official form 520-1 must be filed with the Regional Office of the Wage and Hour and Public Contract Divisions. A copy of the application must be retained by the employer for his file.

3. Minors under 16 years of age are not eligible for student-learner certificates. Furthermore, in occupations declared to be hazardous by the Secretary of Labor, the student-learner must be at least 18 years of age.

   The employer should obtain and keep a file on an employment or age certificate showing the student-learner to be at least the minimum age for the occupation for which he is employed.

   The coordinator and employer should keep in mind that any work done by the student-learner in training must be paid for at the minimum rate until the certificate is received.

J. Calls at the Student-Learners Homes

Each coordinator must visit the student-learner and his parents in their home. Much valuable information can be gained by this and a fine spirit of cooperation can be established between the parents and the school and the coordinator.

K. Difficulties of General Nature Which May Arise

Difficulties of one type or another will be coming up from time to time. The following chart lists certain difficulties and suggested remedies.

POSSIBLE DIFFICULTIES	SUGGESTED REMEDIES
1. Poor selection of trainees	1. a. Set a high standard in the future b. Consult advisory committee c. Confer with principal and former teachers d. Do a better job of explaining to students and parents
2. Poor selection of training agency	2. Same as above: a., b.
3. Improper supervision of student on the job	3. a. Carefully outline the objectives to training agency b. Secure a thorough knowledge of requirements on part or employer

	c. Suggest different types of training d. Suggest methods of supervised training e. Assist in better planning of work
4. Lack of cooperation with faculty	4. a. Demonstrate desire to work with others b. Explain program and promote good will
5. Coordinator has not kept awake to needs	5. Be alert at all times for suggestions
6. Lack of advisory committee members' interest	6. a. Counsel with individual members b. Be prepared to give information c. Anticipate situations in advance and secure advice
7. Improper publicity.	7. a. Hand in material in writing b. Seek cooperation of papers c. Help editors and reporters to get better knowledge of program. Send in corrections about misstatements.
8. Lack of proper consideration of other persons.	8. Try to see other person's point of view
9. Failure to follow proper lines of authority	9. Know proper line of authority and follow it
10. Inadequate coordination	10. Contact and counsel regularly with students, parents, employers and school officials
11. Lack of clear understanding	11. Have a complete and clear knowledge of program and be able to explain it
12. Lack of correlation of related instruction with the work on the job	12. Know what the student is doing on the job and plan the related materials accordingly
13. Failure to build and maintain student interest	13. Counsel with students at frequent intervals and discover real cause of lack of interest

14. Lack of community cooperation	14. Call on general advisory committee for help
15. Inadequate instructional materials	15. Add materials to library, consult with other coordinators
16. Student-learner interest in pay only	16. Impress student with educational value of job experience
17. Too many outside interests	17. Do your job first
18. Inadequate records by coordinator	18. a. Keep records from day to day b. Have definite file for records c. Have regular time to work on them
19. Improper community interest and activities	19. Watch your step - remember, you are an example to many

L. The Supervisor's Visits

No coordinator need ever be fearful of the State Supervisor of Trade and Industrial Education or any member of the staff who may call on him. The sole purpose of supervision is to strengthen the program and assist in handling knotty details which may arise. Any supervisor who enters the classroom or visits the coordinator in the conduct of his duties, does so as a friend and advisor initially interested in the success of the program. The supervisor is one in whom the coordinator can confide.

Each coordinator from time to time will think of many problems he wishes to discuss with the supervisor or questions he wishes to ask. Whenever one of these problems or questions come to mind, the coordinator should jot it down in his notebook. Otherwise, when the supervisor visits, the coordinator will fail to mention some topic he was especially desirous of discussing.

M. Record of Contacts

The coordinator should keep a small notebook in his pocket at all times. From the very first day he goes on the job, he should keep a record of every contact he makes, transferring the temporary recording from the notebook to a permanent record for his files. This includes, of course, coordination visits.

N. Spring Registration

About two months before schools close in the spring, the coordinator begins laying out plans for the next year's program and carefully surveys the sophomore class for prospective student-learners.

It is considered good practice for the coordinator to administer interest inventories and aptitude tests to the sophomore class during March of each year to assist in determining the general field of interest of potential industrial cooperative students. This should be followed by individual counseling.

O. Failures

Some student-learners fail to earn credit for their participation in the program. If a student-learner cannot hold a job, he should be transferred to other classes. If the student-learner will not fulfill his classroom and on-the-job assignments, he should be denied credit. Fortunately, the failures are few, but when they occur they should be dealt with firmly.

P. Examinations

Examinations should be given at regular intervals and at the end of the semester. These examinations should be highly individualized and cover work done in the related classroom. Also, the coordinator should secure from the employer a grade on the manipulative skills of the occupation.

Q. Working Permits

Each student-learner who is under 18 years of age may secure an Employment and Age Certificate. These certificates may be obtained from the City or County Superintendent of Schools. They can also be ordered from the Department of Labor, Springfield, Illinois.

This certificate is only needed in case proof of age is required by the employer. It is the city or county superintendent's responsibility to issue these permits. They are issued in triplicate, one copy for the superintendent's office, one for the employer, and one to be mailed to the Division of Women's and Children's Employment, Illinois Department of Labor, 160 North LaSalle Street, Chicago, Illinois 60601. Although it is the superintendent's responsibility to issue the permits, it is the coordinator's responsibility to see that his student-learners secure them.

R. Student-Learner Responsibility

It is evident that each employer is most interested in his student-learners making a good record at school. This means that the coordinator should impress upon the student-learner at all times the importance of strict adherence to all school rules, an excellent quality of work in all classes, and active participation in any extra curricular activity for which he has time. From this the student-learner perceives that an attitude of "just so I do a good job for the employer" is entirely wrong. No employer wants a student who fails to take advantage of all the opportunities of the school.

S. Civic Club Membership

If it is possible for the coordinator to do so, he will find it highly beneficial to the program if he associates himself with one of the local civic clubs. Many things must be considered before doing this, among which are the coordinator's time schedule, the hour the club meets, dues, etc.

T. Beauty Culture

All students in beauty culture programs are required to register with the Department of Registration and Education, Springfield, Illinois. An apprentice license will then be issued which must be kept in good standing until the required period of apprenticeship is fulfilled. Minimum age for issuing a license is 16 years.

Licensed Industrial Cooperative beauty culture apprentices receiving training in a registered beauty shop must establish that they have completed not less than a total of 2625 hours during the entire period of their apprenticeship before they are eligible to register for examination.

CHAPTER XII

ILLINOIS STANDARDS FOR AN INDUSTRIAL COOPERATIVE EDUCATION PROGRAM

A. Need for Standards

As the Industrial Cooperative Education Training Program has passed through its successive stages of development, many devices and standards have been set up and used. Some have been weighed in the balance of experience and found wanting. In order to assure adherence to the highest possible standards and also meet the requirements of applicable legislation, the Illinois State Board for Vocational Education has approved a State Plan, which states the standards which must be met by all who are involved in the program. Examination of other State Plans will show a marked likeness, indicating that throughout the Nation programs are operating on a very high plane.

At any time that a coordinator may be in doubt about what standards or requirements must be met and maintained, he can turn to the material presented below which is composed of abstracts and policies of the State Board of Vocational Education.

B. Standards for Conducting the Industrial Cooperative Education Program

1. Student-Learner Enrollment

Student learners shall be enrolled in this program with the approval of the coordinator on the basis of their ability to profit from the training. This selection is made after proper guidance and counsel by the coordinator.

2. Field of Training

Any trade, industrial or service occupation eligible for inclusion in the program for student-learners, shall be one for which the preparation consists of organized in-school related instruction supplementing clearly defined work experiences on the job as determined by an occupational committee. No occupations will be included in the program which do not provide an opportunity for continued employment without displacement of other workers.

3. The Agreement

A written training plan shall be required for each student and shall include a schedule of processes to be learned on the job, related instruction given in school, wages and length of training period, type and degree of responsibilities of parties concerned, provision of school credit, hours of work and related instruction, provision for job

progression, probationary period, termination of agreement and other items the local advisory committee deems necessary to include.

4. Rates of Pay

   a. Provision shall be made for a graduated scale of earned wages on an hourly basis. This is to be approved by the advisory committee.
   b. No reimbursement will be granted for a program, the students of which are not being paid a monetary wage at a rate comparable to wages paid to other employees for their time spent in employment.
   c. The Fair Labor Standards Act of 1938 and amendments thereto, prescribe minimum rates of pay for workers engaged in interstate commerce, or in the production of goods for interstate commerce. Care should be taken that student-learners in such occupations receive at least the minimum wage fixed by Federal Law.
   d. Social Security Legislation
      (1) If an employer has three employees and takes on a student-learner in addition, this person will count as the fourth employee and the employer will then be subject to the Federal tax feature of the unemployment compensation provision.
      (2) That if the employer has two employees and takes on an Industrial Cooperative student-learner in addition, this student will not count as the third employee if the student-learner is a minor (males under 21, females under 18) whose principal occupation is as a student actually in attendance at a public or private school unless taxes with respect to such services are voluntarily paid under the Federal Unemployment Tax Act.
      (3) However, if such a minor is employed during regular vacation periods, he is to be counted in employment the same as any other covered worker and the employer is liable for the State tax features of the unemployment compensation provisions of the Social Security Legislation.

5. The Representative Advisory Committees

   a. General advisory committee

      The program of training shall be conducted under the general guidance of a representative of a local advisory committee, such a committee to consist of equal representation from employers and labor.

   b. Craft or occupational committee

      Craft or occupational committees shall be formed for the purpose of assisting the coordinators in developing

the schedules of processes, approving outlines of related instruction and assisting in organizing the individual student's training plan for a particular occupation. Such a committee may be composed of one or more members of each craft or occupation for which training is given.

6. Hours of Work and Study

All student-learners shall be required to spend one-half of the regular school day, which shall be not less than 15 clock hours per week (preferably three consecutive clock hours per day) in organized work experiences on the job under the joint supervision of the school and the employer. In addition to the required time spent in acquiring job experience, each student-learner shall devote one of the regular school periods each day to the study of technical and related subject matter on a correlated basis under a qualified teacher-coordinator.

7. Schedule of Processes

The schedule of process to be learned on the job and the related subject content to be taught each student-learner in the school shall be outlined and approved by the representative occupational or craft committee.

8. High School Credit

Provison has been made to enable the student-learners to receive two units of high school credit per year for the satisfactory completion of the schedule of organized work experience (one unit of on-the-job training) and related instruction (one unit as an in-school elective) making high school graduation possible.

9. Ratio of Student-Learners

Due consideration will be given to the ratio of student-learners to regularly employed workers in any occupational field and shall be determined by the Local advisory committee.

10. Job Progression

Provision will be made for the student-learner to be transferred from one job process to another upon reaching the proficiency level required for satisfactory performance in the occupation.

11. Placement and Follow-up

Consideration will be given to final placement and follow-up and in cases of occupations requiring more time for

training th n can be given during the period the student is enrolled in high school, arrangements for the completion of training through apprenticeship or evening classes will be worked out.

12. Reports

Organization reports, etc. must be forwarded to the State Office immediately after the first week of each semester. Special reports may be asked for from time to time.

13. Plant Training

The State Board of Vocational Education will not participate in a plant training program designed for the initial "breaking-in" of operators in newly located industries. It is immaterial whether or not the demand for training the new workers arises from plant migration or relocation, labor turnover or replacements.

14. Reimbursement of Salary and Travel Expenses

The coordinator's salary is set by the local board of education and is paid from local funds. For approved programs meeting the standards and employing qualified personnel to instruct, the instructor's salary may be reimbursed from State and Federal vocational education funds. Such reimbursement of approved programs will be made annually upon receipt from the local superintendent sworn statements of expenditures. Reimbursement is based upon the total time devoted by the coordinator to the Industrial Cooperative Education Program (hours in-school related instruction, plus hours of on-the-job coordination). Reimbursement is calculated as a percentage of the salary paid to the coordinator and is found by dividing the time (hours) per week, which he devotes to the program, by the total time (hours) in his weekly program. The forms which follow, T&I 35-3, T&I 35-3a, T&I 38 and VE 3-T&I, are used to claim reimbursement from salaries and approved travel for which payment is made by the local board of education to the person having responsibility for coordination and supervision. Included in approved travel is attendance at conferences, workshops, or other meetings called by the State Board of Vocational Education. The actual cost of lodging, not exceeding the maximum of the approved State rate per night, is reimbursable while in attendance at a conference or workshop. Meal costs are not reimbursed.

15. Summer Employment

It is recommended that the coordinator be employed for at least one month longer than the regular school term. He needs at least one month's time in which to select the student-learners, secure training agencies, prepare schedules of processes and make other necessary arrangements

AFFIDAVIT

We, the undersigned, hereby certify that the foregoing report is true and accurate to the best of our knowledge and belief; that the district has complied with the requirements of the law as set forth in Section 27-10 of the School Code in regard to teaching the nature of alcoholic drinks and other narcotics and their effects on the human system; and as set forth in Sections 10-22.5 and 22-11 of the School Code with regard to the non-segregation of pupils on account of color, race or nationality; that each school operated by the school board has complied with the requirements of Sections 27-3, 27-4 and 27-21 in regard to patriotism, American history and constitutional principles; and that to the best of my knowledge and belief the employing personnel of this district has not discriminated in the employment of teachers on the basis of color, creed, race or nationality; nor has color, race, nationality, religion or religious affiliation been considered in assigning any person to an office or position or to any school in the school system.

Subscribed and sworn to before me this 1st day of June A.D., 19 66

/s/ Vernon Crawford
Principal or Superintendent

/s/ Leland Ames
Secretary, Board of Education.

/s/ John R. Harper
Notary Public

(SEAL)

Form VE 3-T&I

before the opening of school in September. A new coordinator should be employed beginning with July 1 preceding the inauguration of the program.

16. Distribution of Student-Learners

The number of student-learners employed in the various occupational fields should be watched very carefully. The following should serve as a guide:

a. All of those enrolled should be employed in strictly trade and industrial occupations unless otherwise specifically approved by the State Supervisor of Trade and Industrial Education.
b. The ratio of girls to boys in the program should be approximately that of men to women in the various occupations as shown in the U.S. census of employment.

17. Definition of a Contact

Since it is desirable that all coordinators place the same interpretation upon the term "contact" when making out the monthly report for the State Office, the word needs to be defined. For this purpose, the term contact may be considered to mean:

a. A personal call or visit that has been planned by the coordinator for a definite purpose, and one in which he was successful in actually talking with the individual or individuals personally, or
b. A call made at the request of one of the parties signing the training plan or his agent, or
c. A personal interview where the coordinator actually discussed the program with an individual who was thought to be able to assist in promoting the program.

In order to facilitate a record of contacts made, it may be assumed that there are two general phases of coordination which may be classified as scheduled routing contacts and promotional contacts. These are defined below:

a. A scheduled routing contact is a planned personal interview between the coordinator and one or more of the parties signing the training plan or his agent for the purpose of correlating the related instruction given by the school with the work experiences provided by the training agency, or for the purpose of discussing the general progress and problems of the students.

b. A promotional contact is an interview between the coordinator and such parties as may be deemed influential in creating interest in or in furthering the development of the program.

On the other hand, a contact is not to be reported under the following situations or conditions:

a. When the call is made by telephone, letter, or any other means except as stated above.
b. When the coordinator meets the student during the time the coordinator is scheduled to be at school.
c. When the coordinator makes a call but fails to get an interview with the person he intended to see.
d. When the coordinator makes a talk to a group or assembly. Promotional contacts may result from talks, but the talk itself is not a contact.

18. Criteria for Determining Number of Routine Contacts

a. When only the employer is seen on a coordination visits, one contact shall be reported.
b. When a student-learner and employer are contacted on the same coordination visit, one contact shall be reported for the employer and one contact for the student-learner.
c. When one or more student-learners in the same department are contacted on a single visit, one contact shall be reported for each student-learner interviewed.
d. When one or more persons representing a training agency, such as the owner, shop foreman, superintendent, or department head are contacted on one trip, only one contact shall be reported except as provided for in the situation as covered in paragraph "e" below.
e. When a training agency has student-learners in more than one department, the number of department heads actually contacted shall determine the number of contacts reported.

CHAPTER XIII

YOUTH ORGANIZATIONS

Each cooperative class as an educational activity shall have as a unit in related instruction a club program for the purpose of instructing in parliamentary procedures and other democratic activities.

The importance of youth organizations as a phase of all programs of vocational education is given emphasis in the following excerpt from the Illinois State Plan.

"Vocational youth organizations shall be established, developed and promoted as an integral part of the total instructional program. The statewide youth organizations shall be supervised by persons meeting the qualifications of a state supervisor of vocational education.

"When the activities of local vocational education youth organizations complement the vocational instruction offered, such activities shall be supervised by persons who are qualified as vocational education teachers. The allocation of time for the program of youth activities shall be the responsibility of the local school administration.

"For youth with special needs and others enrolled in experimental or pilot vocational education programs, youth organizations are to complement the goals of these instructional programs.

"Cooperation between the several youth organizations in vocational education and other organizations of youth and adults with similar objectives shall be encouraged on the State, district, or area, and local levels where the activities, such as joint meetings and projects, would improve the total vocational education program.

"The vocational youth group programs shall be reviewed periodically by the chief state supervisors as part of the evaluation of the total instructional program. The local youth group program shall be evaluated continuously by school and community personnel, such as a local advisory committee that is concerned with the local related instructional program."

A copy of the Constitution and By-Laws of the Illinois Association of the Vocational Industrial Clubs of America is included in the Appendix.

The coordinators's responsibilities for youth club organization and operation may be summarized as follows:

What the Coordinator Does	What the Coordinator Needs to Know
1. Organization of Club	
Arrange for time and meeting place with school principal Call the meeting Give the group the aims and purposes of the club Explain the CREED--EMBLEM--persons eligible for club membership. Local dues--state dues--national dues Explain and help plan induction ceremonies for club members Help in election officers--Time--Number--Duties-- Responsibilities	The aims and purposes of the club The benefits gained by the students Creed and emblem Persons eligible for club membership--Local, state and national dues Requirements for local chapter entrance in state and national organization Election of officers and duties of officers Induction ceremonies for membership into the club
2. Operation of Club	
Supervise and sponsor all club activities Explain how to nominate candidates for State Office. When. Explain State constitution Explain VICA Explain State Convention procedure. Who is eligible to attend. How to enter contest--benefits received Explain and create enthusiasm for all local club--activities--banquet--socials--projects Honor past members Assist officers and committee chairman in planning meetings Assist secretary with chapter reports Assist reporter with news articles Sponsor and assist in organization of district leadership meetings Explain club ratings Teach parliamentary procedure	State and National Constitution When and how to nominate candidates for state officers State & National Convention procedure Who is eligible to attend State convention How to prepare and enter state contest Local activities throughout the year in the club Vocational Industrial Clubs of America Parliamentary procedures

CHAPTER XIV

PUBLIC RELATIONS

Everything a coordinator does involves public relations. Some of the specific items should include:

What the Coordinator Does	What the Coordinator Needs to Know
Prepare newspaper copy or give information to newspapers	How to write newspaper copy What is news How to keep a special feature What is a news item copy should be standard How to prepare radio and T.V. scripts
Radio and T.V. - make programs	
Public speaking	
Work with community groups	Procedure for presentation Types of programs which would be most attractive Selection of participants How to organize material for talk Effective presentation of facts Cultivate proper use of voice Develop vocabulary to present information suitable to group How to prepare notes for talk Proper use of illustrative materials How to work with committee How to conduct meetings (Parliamentary procedures) (Group Dynamics) Organization of conferences Main purpose of each civic group How students may have part in civic affairs How to "fit in" in civic work

INDUSTRIAL COOPERATIVE PROGRAM

School _____ Coordinator _____

Trainee _____ Birth date _____

Establishment _____ Address _____

Person responsible for training at the establishment _____

Employment objective Surveyor Assistant Code number 7-87.200

Accredited training 2 years
(1 or 2 years)

I. MEASURING DISTANCES AND DIRECTION — 20 weeks
1. Use chains, rods, tapes and plumblines
2. Take rod-readings
3. Clear brush
4. Set stakes
5. Read and use surveyor's compass
6. Take magnetic bearings and compensate declinations

II. USE OF TRANSIT AND LEVELS — 20 weeks
1. Set and adjust transit
2. Set and adjust levels
3. Operate transit and various types of levels
4. Clean and care for instruments

III. LAND SURVEYING — 20 weeks
1. Establish base-lines
2. Subdivide sections
3. Make "closed-traverse" surveys
4. Survey by single set-up of transit
5. Survey curved boundaries
6. Relocate lost points
7. Establish grade lines
8. Make topographical surveys
9. Survey areas by compass

IV. OFFICE WORK — 15 weeks
1. Make computations
2. Read and interpret deeds
3. Index and file maps, plans, computations and orders
4. Make layout maps
5. Duplicate maps and charts
6. Clean maps and drawings
7. Maintain office equipment and supplies

V. MAINTENANCE — 10 weeks
1. Sharpen saws, axes, knives, and stakes
2. Clean and repair field equipment
3. Keep shop neat and clean

(Total training time, half-time basis) — 85 weeks

INDUSTRIAL COOPERATIVE EDUCATION TRAINING PROGRAM

To Student-Learner

You are entering a new phase of your high school education, namely, training for a specific job. You are required to spend one hour (60 minutes) each day in a related subject class. You are also required to spend a minimum of three hours each day on the job for which you receive pay. Upon the successful completion of this course, two high school credits will be given each year. Other high school subjects will make up the balance of your schedule.

To succeed in this course you should:

1. Really want to learn a trade or occupation.
2. Be an average or above average student.
3. Be able to carry on school work by following a work plan with a minimum of supervision.
4. Get and keep your parents' interest in this program.
5. Develop the proper attitude toward other employees.
6. Learn to respect rules and regulations.
7. Practice clean habits and develop a pleasing personality on the job.

For your class work you should have and know how to use:

1. A textbook
2. The progression Study Charts furnished with this course
3. References
4. A loose-leaf notebook

Daily schedules:

1. Get your study guide and notebook
2. Fill out daily progression record
3. Carry out work period
4. Fill out wage and hour report Monday of each week

If the interview is successful or you have sold yourself, your next step is to become acquainted with your training memorandum or agreement. Discuss it with your parents. If satisfactory, have them sign; also sign your own name.

You are now ready to train for work.

However, before reporting on the job for the first time, consider the following:

1. How are you going to dress?
2. How are you going to get there?
3. Have you your social security number?

PRE-EMPLOYMENT INFORMATION

Student-learner should have confidence in fairness of foreman and management.

Don't be impatient. It may take several years to learn your job.

Get along with fellow employees.

Be at work on time; avoid being absent except for illness or very urgent matters. Always phone and notify your employer and coordinator when it is necessary to be absent.

Save time -- do not waste it in idle chatter.

When the task assigned is performed, ask your trainer for another.

Do not waste the time of other workmen.

If you have a gripe, discuss it at once with your trainer or coordinator, not with your fellow employees.

Treat all matters of rate of pay, pay raises, earnings, in strict confidence. It is no affair of other employees what you earn, and no interest of yours what they earn.

Apply yourself. Listen carefully when work is explained to you. Do not make it necessary to be told the same thing repeatedly.

Your ability to earn more results from your ability to produce. Money for wages come from production.

Your first tasks will be simple-fundamental ones, and at times they may seem menial and dull. Do not expect to become a skilled worker overnight.

Be neat in your housekeeping about your station.

Take criticism of your work on the basis that it is not meant to be personal, but to improve your competence and skill.

Become one of the family -- don't be a "lone wolf." Attend their parties and outings and celebrations.

STUDENT AGREEMENT

THE INDUSTRIAL COOPERATIVE EDUCATION PROGRAM

The industrial cooperative education program is planned to develop a student academically, economically, and socially. In doing this, there are definite things that must be done. There are responsibilities the student must realize and he must agree to cooperate in carrying them out to the fullest extent.

As condition for acceptance in the Industrial Cooperative Education Program, I therefore agree:

1. To be regular in attendance in school and on the job.
2. To be on time at school and on the job.
3. To notify my employer as soon as I know that I will be absent from work.
4. To notify the coordinator as early in the day as possible on days that I am absent from school.
5. If I am absent from school, I must also be absent from work on that day.
6. To carry out my training on the job in such a manner that I will reflect credit upon myself and upon the Industrial Cooperative Education Program.
7. To perform all my duties in a commendable manner and perform related study assignments with earnestness and sincerity.
8. To conduct myself in a satisfactory manner, both on the job and in the classroom, or my training may be discontinued and I may be removed from the program.
9. To know that if I am removed from the program due to failure either in the class instruction or work experience that I will receive a failing grade for the program and will lose both credits.
10. To attend any function the Industrial Cooperative Education class wishes to sponsor.
11. To pay all normal fees and charges necessary to pay for class activities, i.e., banquet, conferences, field trips.
12. To work toward the group and individual achievement goals.
13. To make a concerted effort to abide by all school rules and regulations, and thereby avoid detentions.
14. That while I am at work, I am in a school program and the appropriate school rules apply, i.e., no smoking on the job, etc.
15. To accept counseling and guidance from the coordinator as an aid to personal improvement.

MEMORANDUM-OF-TRAINING PLAN

Date _____ 19___

I. The _____ will permit _____
(Student-Learner)
to enter their establishment for the purpose of gaining knowledge and experience as _____.
(Occupation)

II. The course of training is designed to run for a two-year period with a minimum of _____ hours per week required for the work experiences and at least one period in each school day required for the supervised and directed study of technical and related subjects.

III. The coordinators shall, with the assistance of the employer or someone delegated by him, prepare a schedule of processes to be learned on the job and an outline of related subjects to be taught in school. These items to be made a part of this memorandum.

IV. The schedule of compensation to be paid the trainee shall be fixed by the training agency and the coordinator and shall become part of this memorandum, and a record noted on the back of this sheet. Such wages shall be comparable to wages paid apprentices and other beginners in the occupation in which the student-learner is engaged. They shall conform to the Fair Labor Standards Act of 1938, amended, if applicable.

V. The student-learner will not be permitted, in the process of gaining occupational experience, to remain in any one operation, job, or phase of the occupation beyond the period of time that is necessary for him to become proficient.

VI. The student, while in the process of training, will have the status of student-learner and will not displace a regular worker now employed.

VII. All complaints shall be made to and adjusted by the coordinator.

VIII. The parent or guardian shall be responsible for the personal conduct of the student-learner while in training.

IX. The employment of the student-learner shall conform to all federal, state, and local laws and regulations.

X. The employer agrees to instruct the student-learner in safety procedures and safe work practices in on-the-job training.

SUGGESTED CONSTITUTION

Constitution of the ILLINOIS ASSOCIATION of the Vocational Industrial Clubs of America

ARTICLE I - NAME

The official name of this organization shall be the ILLINOIS ASSOCIATION of the Vocational Industrial Clubs of America and may be referred to as the ILLINOIS ASSOCIATION of VICA.

ARTICLE II - PURPOSES

The purposes of this Association are:

To unite in a common bond without regard to race, creed, or national origin full time students enrolled in classes with vocational trade and industrial objectives.

To provide leadership for the local clubs.

To provide a clearinghouse for information and activities.

To provide recognition and prestige through an association of local clubs.

To develop leadership abilities through participation in educational, vocational, civic, recreations, and social activities.

To foster a deep respect for the DIGNITY OF WORK.

To assist students in establishing realistic vocational goals.

To help students attain a purposeful life.

To create enthusiasm for learning.

To promote high standards in trade ethics, workmanship, scholarship, and safety.

To develop the ability of students to plan together, organize and carry out worthy activities and projects through the use of the democratic process.

To foster a wholesome understanding of the functions of labor and management organizations and a recognition of their mutual interdependence.

To create among students, faculty members, patrons of the school and persons in industry a sincere interest in and esteem for trade and industrial education.

To develop patriotism through a knowledge of our Nation's heritage and the practice of D E M O C R A C Y.

ARTICLE III - ORGANIZATION

Section 1. The ILLINOIS ASSOCIATION of the Vocational Industrial Clubs of America is an Association of local clubs of the State of Illinois operating in accordance with a charter granted by the National VICA.

Section 2. The Administration of ILLINOIS VICA shall be vested in the State Executive Council comprised of State Association officers and the State Advisor. Officers shall be elected for a term of one year.

Section 3. Charters shall be issued to local clubs by the Executive Council of the ILLINOIS ASSOCIATION of the Vocational Industrial Clubs of America.

Section 4. A State Advisory Council composed of leaders from Education, Business, and Labor Unions shall be appointed by the Head State Supervisor to provide counsel, advice, and assistance to the State Association in carrying out its functions. Equal representation shall be given Business and Labor.

ARTICLE IV - MEMBERSHIP

Section 1. Membership of the ILLINOIS ASSOCIATION of the Vocational Industrial Clubs of America shall consist of the total eligible members of the chartered local club and members shall hold the same membership status as in their respective local club.

Section 2. A local club must have at least ____ members and all members of the State Association must be members of the National Organization to qualify for a charter.

Section 3. Each local club and State Association shall be open for membership to all students regardless of race, color, or national origin.

Section 4. Classes of membership which will be recognized by the ILLINOIS ASSOCIATION of VICA are:

Active Membership: Full-time preparatory students enrolled in secondary vocational courses offered in trade and industrial education meeting the requirements of the State Plan for Vocational Education.

Professional Membership: Persons associated with or participating in the professional development of VICA as approved by a State association. Such members shall include Club Advisors, Teacher-Educators and Supervisors. Professional members will pay dues as established by VICA, but members will be ineligible to serve as a national Voting Delegate, hold national office or otherwise represent his State Association in National VICA.

Associate Membership: Cooperative employers, and/or training station sponsors, advisory council members and lay persons associated with and contributing to the improvement and development of the organization and vocational trade and industrial education. They are not eligible to hold office or vote.

Honorary Life Membership: Individuals who have made significant contributions to the development of VICA and vocational trade and industrial education whose membership has been approved by the National Executive Council upon the recommendation of a State association. Such membership shall not require payment of National dues.

Section 5. A Membership Year shall be from September 1 through August 31 inclusive.

ARTICLE V - VOTING DELEGATES

Section 1. The VICA member shall exercise his franchise through Voting Delegates at State and National meetings.

Section 2. Each club shall elect delegates who shall be considered Voting Delegates at the State Leadership Conference. The number of delegates shall be determined as provided in the By-Laws.

Section 3. The number of Voting Delegates shall be variable with the directives of the national constitution. The number of alternatives shall be the same as the number of delegates. The President of the State Association is automatically a Voting Delegate.

ARTICLE VI - MEETINGS

Section 1. A State Leadership Conference shall be held each year and this shall serve as the official annual meeting of the ILLINOIS State Association of VICA.

Section 2. The State Executive Council shall be empowered to call special meetings.

ARTICLE VII - OFFICERS

Section 1. The officers of the ILLINOIS ASSOCIATION of VICA shall be the President, Vice-President, Secretary, Treasurer, and Parliamentarian.

Section 2. These officers shall be elected by a majority vote of the voting delegates at the annual State Leadership Conference.

Section 3. Officers shall serve for a term of one year.

ARTICLE VIII - DUES

Section 1. State Dues shall be determined at the State Leadership Conference for the school year which follows and shall be payable before November 1. The amount which has been set by the National VICA as National Dues shall be set aside from this amount, to be forwarded by the State Advisor to the National Treasurer.

Section 2. The State Treasurer shall report on or before December 1 of each school year as to which Clubs have paid their Membership Dues in full. These Clubs shall be designated as Clubs in Good Standing.

ARTICLE IX - EMBLEMS AND COLORS

The emblem of the ILLINOIS ASSOCIATION of VICA, and its colors shall be the same as those adopted by National VICA.

ARTICLE X - AUDIT

The Accounts of the State Treasurer shall be audited each year by an Auditing Committee appointed by the President.

ARTICLE XI - AMENDMENTS

Section 1. This Constitution may be amended by a two-thirds vote of the authorized delegates to any annual State Conference.

Section 2. Only such amendments shall be made as are in keeping with the purposes stated in Article II of this Constitution.

ARTICLE XII - RULES, REGULATIONS AND BY-LAWS

Section 1. Such rules, regulations and by-laws as are deemed necessary for the proper conduct of this organization shall be adopted.

Section 2. No rules, regulation, or by-laws shall be adopted which are contrary to this Constitution.

Section 3. In all meetings, Robert's Rules of Order, Revised, shall serve as standard procedure.

SUGGESTED CONSTITUTION FOR LOCAL CLUBS

CONSTITUTION OF
THE (SCHOOL) VOCATIONAL INDUSTRIAL CLUB OF AMERICA
ILLINOIS ASSOCIATION

ARTICLE I - NAME

Section 1. The official name of this organization shall be "(School, Community) Illinois Association of Vocational Industrial Club of America," and may be referred to as "(School, Community) Illinois Association of VICA."

ARTICLE II - PURPOSES

The purposes of this organization are:

To assist local club members in the growth and development of VICA.

To unite in a common bond without regard to race, creed, or national origin full time students enrolled in classes with vocational trade and industrial objectives.

To develop leadership abilities through participation in educational, vocational, civic, recreational, and social activities.

To foster a deep respect for the DIGNITY OF WORK.

To assist students in establishing realistic vocational goals.

To help students attain a purposeful life.

To create enthusiasm for learning.

To promote high standards in trade ethics, workmanship, scholarship, and safety.

To develop the ability of students to plan together, organize and carry out worthy activities and projects through the use of the democratic process.

To foster a wholesome understanding of the functions of labor and management organizations, and a recognition of their mutual interdependence.

To create among students, faculty members, patrons of the school and persons in industry, a sincere interest in and esteem for trade and industrial education.

To develop patriotism through a knowledge of our Nation's heritage and the practice of DEMOCRACY.

ARTICLE III - ORGANIZATION

Section 1. The (School, Community) Vocational Industrial Club of America shall be affiliated with the Illinois Association of VICA. The Club shall operate in accordance with its Charter granted by the State Executive Council of the Illinois Association.

Section 2. The administration of the Club shall be vested in the Club Executive Council comprised of the Club Officers, and Club Advisor. Officers shall be elected for a one-year term.

Section 3. A Club Advisory Council composed of community leaders from Education, Business, and Labor Unions shall be appointed by the appropriate school administrator, upon the recommendation of the Club Executive Council, to provide counsel, advice, and assistance to the club in carrying out its functions. Equal representation shall be given Business and Labor Unions.

ARTICLE IV - MEMBERSHIP

Section 1. Membership of the Club shall consist of full-time preparatory students, enrolled in (Name of Program of Name of School).

Section 2. Club membership shall be open to all students regardless of race, color, or national origin.

Section 3. State and National Membership shall only be permitted through the Club, and all members of the State Association must be members of the National Organization.

Section 4. Classes of Membership which will be recognized are:

Active Membership -- Full-time preparatory students enrolled in vocational courses offered in trade and industrial education meeting the requirements of the State Plan for Vocational Education.

Professional Membership -- Persons associated with or participating in the professional development of VICA as approved by a State association. Such members shall include Club Advisors, Teacher-Educators and Supervisors. Professional members will pay dues as established by VICA, but members will be ineligible to serve as a national Voting Delegate, hold national office or otherwise represent his State association in National VICA.

Associate Membership -- Cooperative employers, and/or training station sponsors, advisory council members and lay persons associated with and contributing to the improvement and development of the organization and vocational trade and industrial education. They are not eligible to hold office or vote.

Honorary Life Membership -- Individuals who have made significant contributions to the development of VICA and vocational trade and industrial education whose membership has been approved by the National Executive Council upon the recommendation of a State association. Such membership shall not require payment of National dues.

Section 5. A Membership Year shall be from September 1st through August 31st inclusive.

ARTICLE V - VOTING

Section 1. (School) Illinois Association of VICA members shall exercise their franchise through Voting Delegates at State Conferences.

Section 2. Each member in good standing shall have the right to cast his vote, concerning all club business and election of club officers.

ARTICLE VI - MEETINGS

Section 1. Regular meetings shall be held at least once each month during the school year.

Section 2. Parliamentary Procedure of all meetings will be governed by Robert's Rules of Order, Revised.

ARTICLE VII - OFFICERS

Section 1. The officers of the (School) Illinois Association of VICA shall consist of a President, Vice-President, Secretary, Treasurer, Reporter, and Parliamentarian; and each shall exercise the usual duties of the office to which he has been elected.

Section 2. The officers of the (School) Illinois Association of VICA shall be nominated and elected by ballot at the first regular business meeting of each school year. A majority of the active members shall be necessary to elect.

ARTICLE VIII - ADVISOR

Section 1. The Club Advisor shall be the Trade and Industrial Education Teacher of the class or course.

ARTICLE IX - FINANCES

Section 1. The Club will be responsible for State and National VICA dues, according to the number of individual members claimed in each membership classification, times the amount established for that classification.

Section 2. The Advisor shall be responsible for the finances and will furnish an annual audit to the State Advisor.

ARTICLE X - EMBLEMS AND COLORS

Section 1. The emblem of (School) Illinois Association of VICA shall be that of the National Organization. The wearing and use of this emblem will be governed by the National Organization.

Section 2. The colors of the (School) Illinois Association of VICA shall be Red, White, Blue, and Gold (or a combination).

ARTICLE XI - AMENDMENTS

Section 1. To amend this Constitution, the proposed amendment must be presented in writing by a member to the President. The President will present the amendment to the membership where it must be approved by a three-fourths majority vote for adoption.

Hymer, Bennett

The Negro Labor Market in Chicago, 1966; Conditions in Employment and Manpower Training.

Chicago Urban League, Ill.
MF AVAILABLE IN VT-ERIC SET.
Pub Date - 66 20p.

NEGROES; UNSKILLED WORKERS; SEMISKILLED WORKERS; SKILLED WORKERS; RACIAL DISCRIMINATION; COMMUNITY SURVEYS; *NEGRO EMPLOYMENT; NEGRO HOUSING; NEGRO EDUCATION; *EMPLOYMENT PROBLEMS; SOCIOECONOMIC STATUS; SOCIAL PROBLEMS; EMPLOYMENT OPPORTUNITIES; EMPLOYMENT TRENDS; *EQUAL OPPORTUNITIES (JOBS); *EQUAL EDUCATION; LOW INCOME; TECHNOLOGICAL ADVANCEMENT; URBAN AREAS; VOCATIONAL EDUCATION; *LABOR MARKET; APPRENTICESHIPS CHICAGO; ILLINOIS

Census data and other research reports provided the data for an evaluation of current employment conditions for Negroes, the impact of recent technological developments on the Negro labor force, and public and vocational education available to Negroes. The major findings of the study were: (1) The lowering of racial barriers had not appreciably affected the socioeconomic status of Negro workers compared with that of white workers, (2) Unskilled Negro workers have been isolated from most of the changes that have taken place, (3) Because of housing segregation the relocation of industry in the Chicago area has resulted in a net loss of jobs for the Negro labor force, and (4) School segregation is now a major employment barrier. The analysis showed that despite the favorable conditions for Negro workers during the past 2 years, the Negro labor force still faces job loss through automation, rising unemployment, low wages, and inferior training. These factors reflect the "dual labor market" in which demand and supply forces operate separately for Negroes and whites in determining earnings, occupational distribution, recruitment procedures, hiring practices training, and promotion of workers. The solutions to these problems require that strong cooperative measures be taken to eliminate employment discrimination, housing segregation, school segregation, and inferior training. (ET)

THE NEGRO LABOR MARKET IN CHICAGO 1966

Conditions in Employment and Manpower Training

Prepared by
BENNETT HYMER

U.S. DEPARTMENT OF HEALTH, EDUCATION & WELFARE
OFFICE OF EDUCATION

THIS DOCUMENT HAS BEEN REPRODUCED EXACTLY AS RECEIVED FROM THE PERSON OR ORGANIZATION ORIGINATING IT. POINTS OF VIEW OR OPINIONS STATED DO NOT NECESSARILY REPRESENT OFFICIAL OFFICE OF EDUCATION POSITION OR POLICY.

VT004010

A Chicago Urban League Research Report

This report was originally prepared by the Chicago Urban League at the request of the Illinois Commission on Automation and Technological Progress. Mr. Hymer presented an oral summary of this material before the hearings on Vocational Education and Manpower Training in Relation to Employment Requirements, October 21, 1966.

I. INTRODUCTION

Over the past few years several major developments have occurred in the Chicago labor market that have been of particular importance to the Negro labor force. The pressures brought to bear by the Civil Rights Movement have resulted in the lowering of racial barriers in hiring and in the creation of new manpower retraining programs. On the economic front there has been an extremely tight labor market of exceptionally long duration. The rapid growth of the Chicago economy which has been responsible for the recent high demands for labor has also featured the continuance of two trends--the relocation of industry within the Chicago metropolitan area and the shift in the manpower requirements of employers from unskilled to skilled labor.

During the same period we also note a sharp controversy concerning Negro education in Chicago, no significant change in the relative status of the Negro worker in the Chicago labor market, disturbances and social unrest in low-income, nonwhite neighborhoods, and, most recently, a rise in the nonwhite unemployment rate.

This study analyzes these events. First, there is an evaluation of current employment conditions for Negroes in the Chicago labor market. Second, there is an assessment of the impact of recent technological developments on the Negro labor force. And, third, there is an examination of Negro public and vocational education in Chicago.

The research for this study is based upon recent Urban League research reports, the latest census data, and several academic oriented studies. The study has also utilized the practical expertise of the League's Employment and Guidance Department which directly encounters the problems faced by Negro workers in the Chicago labor market through interviews with job seekers and contact with employers. Most of the data and information presented pertain directly to the Chicago area; however, in some instances only national and regional employment estimates were available. In the past these figures have typified the Chicago picture.

The major findings of the study are:

(1) The lowering of racial barriers has not appreciably affected the socioeconomic status of Negro workers vis-a-vis that of white workers.

(2) Unskilled Negro workers have been isolated from most of the changes that have taken place.

(3) Because of housing segregation the relocation of industry in the Chicago area has resulted in a net loss of jobs for the Negro labor force.

(4) School segregation is now a major employment barrier.

II. THE NEGRO WORKER IN TODAY'S LABOR MARKET

Several key factors during the past few years have made employment conditions for Negroes the most favorable since the Korean War. First, an extremely tight labor market resulting from an economic expansion of exceptionally long duration has created a strong demand in the Chicago economy for almost all types of labor and in almost all industries. Second, the pressures exerted over the last decade by the Civil Rights Movement on employers and government has produced the 1964 Civil Rights Act, State Fair Employment Practices laws, Federal Executive Orders, and, most importantly, revised hiring policies in the private sector of the economy. Third, several programs initiated and sponsored by the Federal government now provide training for workers who lack the skills necessary for many of the present job vacancies. Under the Manpower Development Training Act (MDTA), many unskilled Negro workers are receiving specific occupational training through local On-The-Job Training (OJT) and institutional training programs.

These factors have resulted in the disappearance of most of the overt forms of hiring discrimination and in the lowering of many racial barriers in employment.[1] In the past, discrimination in hiring and promotion established job ceilings for Negroes and other nonwhite workers in almost all areas of the labor market. Negroes were either denied entry into many companies or had limits placed on their upward occupational mobility. Today, Negro workers can be found in many occupations from which they were previously excluded.

Although most of the overt forms of employment discrimination have disappeared, the integration of the labor force that has occurred has been limited. Discrete exclusionary methods like residence requirements, culturally-biased aptitude tests, irrelevant hiring criteria and recruitment procedures still curtail the hiring of nonwhite workers. In other cases, inadequate training, the result of a segregated school system, keeps Negroes out of many jobs. Also, some employers are engaged only in tokenism when integrating their labor forces as they are not taking affirmative action to either increase the flow of Negro applicants or to upgrade their existing Negro labor force. Finally, discrimination in promotion and in the selection of workers for advanced training often prevent the advancement of nonwhite workers.

Consequently, the current lowering of racial barriers in hiring has not appreciably affected the status of Negro workers in the economy. Even with the integration of the labor force that has taken place, the position of the Negro worker in the Chicago labor market remains as far behind that of the white worker as before the Civil Rights Movement.

---

[1] Although it is impossible to estimate which factor has had the most effect in changing the hiring practices of employers--the tight labor market or pressure from government and civil rights groups--it is our impression that the former has been the major determinant of racial change in employment.

From 1960 to 1965 the ratio of Negro to white earnings for the North Central United States region, which includes Chicago, dropped from 74 percent to 72 percent, as the income gap between white and Negro earnings increased from $1800 in 1963 to $1900 in 1964.[1]

Perhaps more important, the rate of Negro unemployment is again rising. According to recent national employment figures of the U. S. Department of Labor,[2] the Negro unemployment rate rose from 7.0 percent to 8.2 percent from April, 1966, to August, 1966, despite the existence of numerous job vacancies. During this same period the unemployment rate for white workers remained constant at a low 3.4 percent. For the teenage segment of the Negro labor force (16-19 years), the unemployment rate remained at its disastrously high 27 percent level of the preceding year. In contrast, the unemployment rate for white teenagers fell from 14 percent in 1965 to 12 percent in 1966.[3]

Moreover, not all of the Negro labor force has been affected by the recent expansion of employment opportunities for nonwhite workers. In particular, unskilled Negro workers have been critically isolated from recent changes. Aggregate data obscures some of the important intergroup differences that exist within the Negro labor force. We get a more comprehensive picture by considering workers within broad occupational and skill categories.

Skilled and semi-skilled Negro workers, who together form from 40 to 50 percent of the total Negro labor force, have been the major beneficiaries of recent changes in hiring policies. Relative to white workers of similar backgrounds, Negro professionals, managers, operatives, and clericals have been able to maintain their relative income positions while experiencing substantial increases in living standards resulting from the current economic prosperity. In some instances, particularly among younger Negro workers like recent college graduates, the gap between white and Negro earnings may even have declined. In contrast, older Negro professionals employed in the public sector of the economy are still locked out of the more lucrative jobs that have opened up for skilled workers because of the age barrier in hiring.

Unskilled Negro Workers

The remaining 50 to 60 percent of the Chicago Negro labor force is made up of some 190,000 to 225,000 unskilled workers employed in low-paying

---

[1] U.S., Department of Labor, The Negro in the United States, Their Economic and Social Status, Table III, A-4, p. 139.

[2] U. S., Department of Labor, News Digest, September 12, 1966.

[3] Recent studies in metropolitan areas show that the unemployment rate for Negro teenagers is the same both in and out of poverty areas; in contrast, white unemployment rates range from 20 percent in poverty areas to 12 percent in nonpoverty areas.

factory jobs or in service industries. For the most part, unskilled Negro workers have not shared in the recent economic prosperity nor has their social and economic position been ameliorated by any of the changes in race relations that has occurred, e.g., lowering of racial barriers or Federal programs like the War on Poverty.

Relative to unskilled white workers, the earnings of unskilled Negroes remain as far behind as in 1957. In some cases real income has not appreciably changed as increases in wage rates have only kept pace with higher prices. For other unskilled Negro workers, the movement of industry to the suburbs has resulted in higher transportation expenditures because of the lack of suitable communication between the inner city and the outlying areas of the city. Also, the incidence of the color tax, the rent differential between white and Negro dwelling units, and consumer credit abuses fall mostly on low-income Negroes.

Urban Peasantry

Particular groups of unskilled Negro workers are almost completely locked out of the mainstream of the economy. Over twenty percent of the Negro labor in Chicago (75,000) is employed at incomes below the $3,000 poverty level, while another 10 to 12 percent (40,000) is either unemployed or out of the work force completely, i.e., they are discouraged workers. These 115,000 workers and their families form a black urban peasantry that constitutes a pool of redundant surplus labor.

Relative to the number of unskilled jobs that are available to these workers, there is an excess labor supply. Because these workers have not been equipped with the skills needed in today's labor market, they are technologically obsolescent and have to rely on welfare assistance to prevent incomes from falling below the subsistence level.

The size of Chicago's urban peasantry has remained the same over the past fifteen years. The labor market entry of Southern migrants and indigenous teenagers from Chicago's public schools offset the number of workers who have been able to find suitable jobs that allow a decent standard of living.

Two factors prevent a significant reduction in the size of Chicago's Negro urban peasantry. First, unlike past pools of urban unskilled labor who were able to assimilate throughout the entire society over time, these workers are confined to the bottom layers of the socio-economic scale by both racial discrimination and the decline in the use of unskilled labor in production. Second, the inadequate training given to Negro youngsters in the Chicago schools virtually insures that many Negro youngsters will enter the labor market with no marketable skills.

The conditions under which this urban peasantry work and live are responsible for the outbreaks of racial violence that occurred during the past year. Last summer's disturbances in Chicago's low-income, nonwhite neighborhoods, as well as those living in other cities involved both the unemployed and the employed poor. In many cases the motive for the looting was dire economic need. Behind the violence was the cry of our cities socially and economically deprived citizens that forms of economic security with dignity be provided.

Slum dwellers in Chicago's Westside and Puerto Rican areas of residence, in the Hough Area of Cleveland, and in the Watts Area of Los Angeles who are employed are concentrated in the least secure, least desirable and least rewarding jobs. Three out of four Negroes who live in these areas and who have jobs work either as low-paid, semi-skilled factory workers, or as unskilled laborers, or in the service industries. In contrast, only three out of ten white workers who live in officially designated poverty areas are in such lowly jobs.[1]

The Dual Labor Market[2]

If it were not for the tight labor market, the lowering of racial barriers in hiring, the retraining programs, and the high conscription rate of Negroes into the Armed Forces, the Negro labor force would be facing a major depression. The current rate of Negro unemployment, if it existed throughout the entire economy, would produce a national crisis.

High Negro unemployment, low incomes, and the existence of a black urban peasantry reflect a racial dualism in the structure of the Chicago labor market. In practice, the Chicago labor market consists of two sectors: a primary metropolitan job market in which firms recruit white workers and white workers look for jobs, and a smaller, secondary market in which firms recruit Negro workers and Negro workers look for jobs.[3] For both the white and Negro sectors of the job market there are distinct demand and supply forces determining earnings and occupational distribution as well as different practices and procedures for the recruitment, hiring, training and promotion of workers.

Racial dualism in the Chicago labor market is visible in many dimensions--by firm, by departments within firms, by industry, by occupation, and by geography. In general, Negro workers are hired by certain industries

---

[2] This section is based upon "The Negro Worker in the Chicago Labor Market," Harold Baron and Bennett Hymer, Employment Service Review, August, 1966.

[3] In Chicago, the Negro job market is approximately one-seventh the size of the white job market.

and by particular firms within these industries. Within all industries, including government service, there is unmistakable evidence of occupational ceilings for Negroes. Within establishments that hire both white and Negroes, Negro workers are usually placed in specific job classifications and production units. A good rule of thumb is that the lower the pay, or the more disagreeable and dirty the job, the greater the chance of finding a high proportion of Negroes; or the lower the position on the occupational scale, the greater the chance that there will be integration for a particular job classification.

In a racially dual labor market, jobs are distributed between white and Negro workers through discrimination in a way that gives white workers first opportunity at employment. Over a long period of time the effect of the dual labor market structure is to confine the position of the Negro labor force to that of a surplus labor pool. Expansion of employment opportunities for Negro workers occurs only during periods of tight job markets when certain jobs transfer either partially or fully from the white to the Negro sector. Most firms actively recruit or hire Negro workers only when the pool of white labor is dried up. Also, as the size of the Negro population and its purchasing power increase, certain jobs open up in servicing the Negro community.

The dual labor market also means that Negro workers receive lower pay than white workers. A recent study has compared unskilled white and Negro workers in Chicago.[1] Of those included in the study the unskilled Negroes had more education and better job experience. Yet, the unskilled Negro workers earned 17 percent less for basically the same type of job. In two particular occupations considered in the study, Negroes earned less than whites even though they were better qualified on terms of their training and backgrounds--Negro material handlers earned 30 cents an hour less than white material handlers and Negro janitors earned 10 cents an hour less than white janitors.[2]

---

[1] David P. Taylor, "The Market for Unskilled Negro Males in Chicago," (unpublished dissertation, University of Chicago, June, 1966).

[2] These figures also refute the argument that Negroes earn less than whites because they are less skilled; as indicated, the study compared whites and Negroes with similar backgrounds.

III. TECHNOLOGICAL CHANGE AND THE NEGRO LABOR FORCE

Technological developments in the Chicago economy include both the relocation of industry and the substitution of machine for manpower in production processes. These changes have had important repercussions on the Negro labor force resulting in a net decline in the number of jobs available to the Negro labor force.

The Movement of Industry

An on-going study by the U. S. Department of Labor reveals that during the last decade (1954-1965) more than half of all new industrial and mercantile buildings were constructed outside of the central cities of the nation's metropolitan centers.[1] In Chicago, the areas which have had the most growth between 1959-1963 in net industrial locations were the ones furthest removed from the Negro community, while the areas which had lost the most jobs were located inside the Negro community.

Housing segregation in both the suburbs and the city prevents Negro workers from finding suitable housing near those jobs that are far removed from Negro ghettos. A recent study estimates that residential segregation in Chicago had cost the Negro labor force by 1956 at least 30,000 jobs.[2] In view of the conditions that employment decentralization, i.e., distribution of jobs within the Chicago geographical area, is proceeding steadily, while Negro residential centralization is increasing, the problem is likely worsening and is probably more serious than the 1956 estimates suggest.

Housing segregation also means that jobs for unskilled Negroes in suburban areas represent difficult, costly and time-consuming trips from central residence areas where the majority of Chicago's unskilled Negro population live to suburban workplaces. Unlike low-income white workers, Negro workers cannot adapt their residential choices to their job locations and to available transit sources. The transit system that is available in Chicago to transport Negro workers from the ghetto to the outlying areas is slow, expensive and involves several transfers. In a recent study, it is estimated that as many as 112,000 Negroes might move from Chicago's ghetto to suburban residences if they were free to choose locations similar to those available to low-income whites.

[3] Ibid.

Automation

The substitution of machine for manpower has resulted in a decrease in the proportion of jobs that do not require more than a few years of high school and an increase in the proportion of jobs that require sophisticated or advanced training. It can be expected that as the Chicago economy industrializes even further, the shift from unskilled to semi-skilled and skilled jobs will continue.

The Effect of Automation on Unskilled Negro Workers

Negro workers are already the victims of automation and technological progress. Within a racially dual labor market structure in which the Negro labor force is overrepresented in unskilled occupations and underrepresented in semi-skilled and skilled occupations, automation results in a net job loss for the Negro labor force.

Most of the job losses for the Negro labor force resulting from automation occurs within the unskilled segment of the labor market thereby directly reducing employment for unskilled Negro workers. Because automation affects unskilled white workers as well, a secondary effect occurs. Given the shrinkage in employment for all unskilled workers, discrimination in hiring serves as a rationing device to distribute the available number of unskilled jobs disproportionately between the white and Negro labor forces.[1] Consequently, unskilled Negro workers have higher rates of unemployment than unskilled whites and have to accept employment at lower wages in industries where working conditions are not as favorable.

Semi-skilled and Skilled Negro Workers

Although semi-skilled and skilled Negro workers are in a position from which they may sometimes benefit from the creation of new jobs, they still cannot make as much progress as white workers in comparable positions. Most of the new job openings are filled by intra-firm placement and promotion. Few Negroes are already in positions from which they may quickly move up because of past discrimination in employment. Those Negroes who have made breakthrough usually lack the seniority to be offered these new jobs. Also, while discriminatory barriers in hiring have been lowered in many establishments, discrimination in promotion still prevents Negro workers from moving into new positions.

When automation does result in job loss in the semi-skilled and skilled occupations, the first workers laid off are usually those with the least seniority. Since Negroes are often the newcomers, they are the first to be laid off. The next occupational area to be affected

---

[1] The role of discrimination as a rationing device probably occurs in semi-skilled and skilled occupations as well.

by automation probably will be clerical and office help where Negroes have just been entering. In essence, Negroes in these professions may have earned the right to the job at the same time that the job is disappearing.

IV. PUBLIC EDUCATION AND VOCATIONAL TRAINING FOR NEGROES IN CHICAGO

Many of the problems now experienced by the Negro labor force in Chicago--job loss because of automation, low wages, insecure employment--may be attributed to inadequate training. In fact, discrimination in education and training has become as significant an employment barrier as discrimination in hiring.

Presently, many employers have unfilled job openings at the same time that from 10 to 12 percent of the Negro labor force is either unemployed or out of the labor force completely and an indeterminate number of Negro workers are employed below their skill levels. This situation results because of past and present conditions surrounding Negro public school and vocational training in Chicago. Given the current demand for semi-skilled and skilled workers in the labor market, the training and skill levels of the Negro labor force are now out of balance with present employment conditions.

The manpower gap that now exists within the Negro labor force is not unusual in an economy where job openings can expand almost instantaneously because of an increase in production while at least twelve years of training and preparation are required to fill these openings. In the past, the educational level of the Negro labor force was not an important determinant of employment since discrimination in hiring automatically excluded Negroes from many areas of the labor market.

Almost all of Chicago's major institutions for vocational training and public education operate according to a dualism based on race. With few exceptions we find either that there is a separate set of facilities for Negroes or that there is deliberate and systematic exclusion of Negroes when only a single facility is available. Where separate schools are available, the Negro institution is always inferior. In those cases where there is integration, we find that only a token number of Negroes are allowed to pursue certain courses.

Segregation and discrimination in Chicago's educational and pre-job training facilities reflect the racially dual labor market structure. Chicago's public schools and other institutions of vocational training have adjusted to the racially dual demand for workers in the Chicago labor market by providing inferior educational facilities to Negro pupils. The inferior training received by Negroes in Chicago's public and vocational schools is in fact only a "logical" response of the Chicago school system to the prevailing pattern of segregation in employment and housing.

Since Negroes in Chicago are generally restricted to low-paying and unskilled jobs which seldom require formal education or advanced training, there has been very little economic pressure on the schools to provide adequate education and preparation for Negro youngsters. Ironically, within the present framework of Northern urban racism, the system whereby Negro youngsters receive inferior educations is an economically efficient one according to the narrow interpretation of social planning that a segregated society uses. Second-rate educations prepare Negro youngsters for the second-rate jobs to which the Negro labor force has been confined.

Public School Education

The status quo in employment in the Chicago labor market is as effectively maintained by discrimination in education as by discrimination in hiring. The current relationship between education in Chicago's schools for Negroes and their success in the labor market is best summed up by a statement by Professor Kenneth Clark, the noted Negro psychologist: "Personnel men need no longer exercise prejudicial decisions in job placement, the educational system in Chicago screens out Negroes for them."

By all standards of performance or measurement, Negro pupils in Chicago receive an inferior education. A typical Negro school in comparison to a typical white school has more overcrowding of pupils in the classroom, more inexperienced teachers, lower expenditures per pupil and inadequate supplementary services like libraries and laboratories.[1] Only one-half of the Negro pupils who enter the first grade graduate from high school. Of those who do graduate, many do not have the equivalent of a good grade school education.

One junior college in Chicago reported in 1960 that less than one-fourth of the entering Negro pupils had test scores that indicated they could make passing marks in a four-year college. Another reported that one-third of the entering class students, almost all of whom are Negroes, had to attend remedial classes to learn to read, write and do simple arithmetic before embarking on the junior college curriculum. These students were graduates of Negro high schools in Chicago, their median reading scores were at the eighth grade level.[2]

A study of welfare recipients in a selected Negro residential area in Chicago revealed that of those who had been educated in Cook County, and who had completed eight years or more of schooling, 29 percent

2 Chicago Urban League Testimony in DeFacto Segregation in Schools, U. S. House, Committee on Education and Labor, 89th Cong., 1st Session, pp. 120-121.

tested as functionally illiterate. That is, they had a fifth-grade reading level or less. Only 18 percent of the Chicago educated subjects included in the study could read at the level of the school grade they had completed.

In the Hauser Report on Public School Segregation, it was reported that in all-white schools the average ninth-grade reading score was 12 points above the city median while in all-Negro schools it was 27 points below the city median. The results of this situation are obvious. Negro dropouts are destined to remain unskilled workers for the rest of their lives if they are fortunate enough to find employment. Even Negro graduates of the Chicago school system find themselves at a competitive disadvantage because whites have received a better education.

Vocational Education[1]

Both technological developments in the Chicago economy and changes in the composition of Chicago-based industry have made the curriculum and equipment in Chicago's vocational schools outdated. In many instances the schools find it impossible to duplicate the equipment and processes now used by industry.

At the same time most large employers prefer to conduct their own technical or vocational training programs. Increasingly, employers require that new employees possess the basic intellectual skills that presumably result from a sound high school education. Because they receive inferior educations, Negro pupils often have difficulty meeting the basic reading and writing requirements of employers. When they are hired, it is usually for temporary jobs or for jobs in which there is little chance for advancement.

Most of the Negro vocational schools are grossly inferior to the white vocational schools. Three of the four Negro vocational schools have the least impressive physical facilities. Two of the schools have been considered so inadequate that their transformation into adult education centers was recommended. Of the four vocational high schools that are below the city average in terms of number of pupils graduated, three are predominately Negro. Attendance areas seem to be drawn in a way that establishes certain vocational schools as Negro and others as white. There is also evidence of a pattern of exclusion of Negroes from the white schools.

Vocational Counseling

Counseling falls into the general pattern of inadequate education for Negroes. Most of the Negro high schools do not have a full

---

[1] This section is based on The Public Schools of Chicago, A survey by Robert J. Havighurst, Chapter XI (Chicago, 1964).

complement of certified counselors. In some schools the pupil-counselor ratio has been established at 350 to 1. Often the counselors do little counseling, spending their time performing petty disciplinary and administrative tasks.

But more important most counselors in the Negro school counsel within the context of a racially dual labor market structure. Because of inadequate information concerning job openings for Negroes, youngsters are still referred only to those occupations where it is known that Negroes are hired--teaching, postal service, etc. Many counselors are not aware of the expansion in career opportunities for Negroes.

On-The-Job and Pre-Job Training[1]

Several government sponsored training programs are now in operation to retrain workers for occupations in which there are known shortages of labor. A rough estimate would be that about 800 Negro workers are currently being retrained through On-The-Job Training and about 2900 through institutional training out of a total of 40,000 who are in need of such retraining.

These training programs have been limited by three factors:

(1) Only a small portion of the trainees are probably from the hard core unemployed. The process used to select applicants in these programs seems geared to selecting workers who represent the cream of the unemployed and underemployed. The only significant exception is the JOBS NOW Project which has been designed to reach young workers who have specific social handicaps--school dropouts, criminal records, etc.

(2) The programs are not large enough in scope or depth to include the vast number of workers who need retraining. At the present time only a handful of workers who need retraining receive it.

(3) Negro graduates of these retraining programs usually can only find jobs that lie within the dual labor market structure. In most cases, they encounter discrimination in hiring once they begin working. According to a recent U. S. Department of Labor survey, the nonwhite M.D.T.A. graduate earns 21 cents less an hour than the white M.D.T.A. graduate even though nonwhites in the program have higher educational levels.[2]

Apprenticeship

Traditionally, Negroes in Chicago, as in other cities, have been denied entry into most of the crafts and unions. In 1961 approximately one percent of the enrollees at the Washburne Trade School were Negro

---

[1] The Urban League has an on-going On-The-Job Training Project involving some 400 trainees.

[2] U. S., Department of Labor, "Training of Public Assistance Recipients Under MDTA," Manpower Evaluation Report, April, 1966.

(26 out of 2,682). Out of 12 trades surveyed, only five had any Negro apprentices.[1] In 1965, only 97 out of the 2,834 apprentices enrolled at Washburne were Negro.[2] If we consider only the building trades, in 1965 there were 50 Negro apprentices, as of September, 1966, there were 147 Negro apprentices. Although this represents a substantial improvement in absolute numbers, it still does not come near a figure proportionate to the 33 percent Negro population in the age group relevant for apprenticeship.

Several barriers limit the entry of Negro youngsters into apprenticeship:

(1) There exists an information gap between the crafts and the Negro community concerning apprenticeship openings. Information about openings is not distributed on a mass basis to counselors in Negro high schools. Several schools do not even mention apprenticeship in their literature. Many Negro youngsters still believe that Negroes are still refused entry into certain crafts while other youngsters have no concept of a craft. The passage of information by friends or relatives concerning openings does not work in the case of the Negro work force since so few Negroes are already skilled mechanics or craftsmen. Also, many of the large shops that have openings are white owned and pass on the information to white workers only.

(2) Most unions still practice only tokenism, i.e., they hire or admit only a few Negroes to satisfy watchdog committees and agencies.

(3) Few crafts practice affirmative action whereby they actively seek out Negro youngsters for apprenticeship.

(4) There is a veil of secrecy on the part of unions as to how the selection and placement of applicants on the waiting lists are made. There are no guarantees or safeguards to prevent the unions from again discriminating once they have admitted a few Negroes.

V. CONCLUSION

Racism in Chicago is manifested in segregated housing, in inferior education and in a racially dual labor market. The relationship in Chicago between the impact of technology on the Negro labor force and conditions in the public and vocational schools is clear cut. Negro workers are more likely to be victims of economic dislocation than white workers because they receive inferior training. In turn, this inferior training results from a racially dual labor market structure maintained by the existence of Northern urban racism.

Even with the tight labor market continuing, the income positions of semi-skilled and skilled Negro workers in Chicago will remain stationary relative to those of white workers. At the same time, employment conditions for unskilled Negro workers will continue to deteriorate so long as no significant changes occur in the school system and the labor market.

Moreover, the possiblity of the tight labor market maintaining itself for much longer may be very slim. In a recent speech, Dr. Andrew Brimmer, the Negro member of the Federal Reserve Board, stated that:

> "Negro job gains are large and Negro unemployment falls sharply only when the economy is growing at a 'real' rate--after adjusting for higher prices--of well over four percent a year as measured by the gross national product, such as the experience of 1964 and 1965 which were the best years in the Negro's employment history and in which the number of Negroes crossing the poverty line was impressive.
>
> "Current economic conditions with nearly full employment and inflationary pressures call for a moderation of the growth rate next year to four percent. This may mean not simply a slackening in the pace of improvement but a halt in further progress and even some rise in unemployment for nonwhite workers. Postwar experience shows that a four percent growth in the economy produced a growth in blue collar jobs of about three-quarters of one percent. Yet, the recent rate of growth for the nonwhite labor force has averaged about 1.5 percent a year."[1]

Our analysis has shown that despite the favorable conditions for Negro workers during the past two years, the Negro labor force still faces job loss through automation, rising unemployment, low wages and inferior

---

[1] Andrew F. Brimmer, The Quests for Economic Stability and Equal Employment Opportunity, A Speech to The National Urban League Equal Opportunity Day Dinner, November 18, 1966.

training. The solutions to these problems require that strong joint measures be taken to eliminate employment discrimination, housing segregation, school segregation and inferior training. The current system whereby proportionately more Negroes than whites enter the labor market as unskilled workers will remain so long as Negro workers do not have the same access to education, employment and housing.

More specifically, the entire Chicago school system needs to be upgraded. As a minimum, standards of education in both Negro and white, public and vocational schools must be brought up to the levels of suburban schools. Educators in Chicago must not be allowed to write off Negro children as uneducable because current teaching methods are not designed to reach youngsters from low-income family backgrounds. Second, discrimination in housing, which limits the mobility of Negroes to jobs and schools, must be eliminated. Third, employers must not practice just tokenism in regard to integrating their labor forces but must actively recruit Negro workers and institute training programs designed to overcome deficiencies caused by past inequities.

In essence, equality of results in education, employment and housing rather than mere equality of opportunity must become our social goals, and there must be a definite timetable for reaching these objectives. In some cases, this can be accomplished by enforcing existing legislations; in other cases, by expanding or improving current programs; and, in still others, by developing new programs and legislation to attack particular problem areas. More specifically, governments at all levels, city, state and Federal, must cooperate to accomplish the following:

1. All employment data for Illinois and Chicago should be broken down by race. Presently, information on the nonwhite labor force is available only at ten-year intervals from the U. S. Bureau of Census. Such data would enable interested agencies to know in what areas of employment Negroes are over or under represented and are earning less than whites.

2. On-the-job training and institutional training programs should be expanded so as to include all workers in the Chicago area who require additional training in order to be meaningfully employed.

3. There should be effective Open Occupancy throughout the entire state so that Negroes can live near job openings and the better schools. Open occupancy laws should be passed at both Federal and State levels and special programs should be instituted to assist Negroes who desire to move out of the ghetto.

4. The quality of education in all schools in Chicago should be raised to the levels of the better suburban schools. The allocation of state expenditure on public education should be used to equalize educational standards throughout the State so that more money is spent on pupils who are most needy of better education.

5. The number of Negro apprentices in the Chicago area should be proportionate to the number of Negroes in the corresponding age group.

6. There should be rigorous enforcement of the Illinois FEPC law, Section VII of the Civil Rights Act, and Federal Executive Orders banning discrimination in employment.

7. Transportation between Negro areas of residence and the outlying regions of Chicago should be improved by both the development of economically rapid transit and inner-city highways.

8. Programs should be developed to encourage industry to relocate or remain in inner-city areas. An effective program involves special investment bonuses, tax concessions, good transportation routes, water and sanitation facilities, and land clearance of obsolete industrial and commercial tracts.

*WORK STUDY PROGRAMS; *PROGRAM EVALUATION; GRADUATE SURVEYS; STUDENT ATTITUDES; GRADE POINT AVERAGE; PROGRAM ADMINISTRATION; COUNSELING EFFECTIVENESS; JOB TENURE; *SUCCESS FACTORS; URBAN SCHOOLS; *HIGH SCHOOL GRADUATES; *EMPLOYMENT; *VOCATIONAL EDUCATION; MENTALLY HANDICAPPED; PROGRAM DESCRIPTIONS
NEW YORK

The purpose of the study was to identify aspects found in secondary school vocational study programs that seem to be closely related to graduates' job success. Five variables relating to the work-study programs and four variables relating to job success were used as criteria in determining which graduates had been the most occupationally successful. Data were received from a random 20 percent of 246 of the graduates who participated in the vocational work-study programs in five major city school districts. Of the 20 hypotheses tested, only 2 were found to be significant at the .05 level of confidence: (1) The students' grade point averages will have a positive relationship to the "Dictionary of Occupational Titles" classification of graduates' jobs, and (2) Assignment of students to work-study job stations related to their major field will be realted to the proportion of students' time employed after graduation. Some of the findings relating to the programs were: (1) Approximately 76 percent of the sample felt the program had helped them since graduation, (2) Approximately 80 percent felt they did better in school work while in the program, (3) Only 21 percent of the males and 70 percent of the females were placed in work-study program situations complimenting and extending their vocational programs, and (4) Relative minor emphasis was given to the guidance function of the 5 work-study programs. Data relating to employment revealed that (1) About 69 percent had a job when they left school upon graduation and an additional 12 percent found jobs within 30 days, (2) Approximately 82 percent were earning more than $1.51 per hour, and (3) The graduates' success on the job related to placement in jobs for which they had received specific training. A summary of the study is given in VT 005 269. (MM)

Problem

With the passage of the Vocational Education Act of 1963 by Congress, approximately 45 percent of the school districts in the state of New York initiated work-study programs. The purpose of these programs has been to provide occupational training for secondary school students so that they might make a smooth entrance into the world of work.

Until the present study, no systematic attempt has been made to determine the degree to which the various programs have been fulfilling their purpose or to find out what aspects of work-study programs seem to contribute most directly to job success among graduates.

Design of Study

The present study was so constructed as to identify aspects of the work-study programs that seem to be most closely related to job success among the graduates. In order to do this, it was necessary to identify factors involved in job success that could be used as criteria in

determining which graduates had been the most successful occupationally. The Vocational Work-study Programs included in the present study were those operated by the city school districts of New York City, Rochester, Schenectady, Syracuse and Yonkers.

There were five educational program variables and four job success factors used as criteria in this study. The educational program variables selected were:

1. The proportion of Work-Study Administrators and Supervisors to the number of students in the occupational program;
2. The students' grade point averages;
3. The number of hours of counseling;
4. The administrators' salaries;
5. Assignment of students to Work-Study job stations related to students' major field.

The job success factors are:

1. The D.O.T. classification of graduates' jobs;
2. The proportion of students' available time actually employed after graduation;
3. The students' actual job held upon graduation and the students' actual job potential;
4. The job salaries of program graduates.

It was on the foregoing criteria that the hypotheses of this study were based.

Hypotheses

This study was designed to test twenty hypotheses. These hypotheses are arranged for the sake of convenience in five groups of four hypotheses each according to the educational programmatic factors involved.

The first four hypotheses deal with the relationship of the proportion of Work-Study Administrators and Supervisors to the number of students in the occupational program to job success factors.

H_1: The proportion of Work-Study Administrators and Supervisors to the number of students in the occupational program will show a positive relationship to the D.O.T. classification of graduates' jobs.

H_2: The proportion of Work-Study Administrators to the number of students in the occupational program will show a positive relationship to the proportion of students' available time actually employed after graduation.

H_3: The proportion of Work-Study Administrators and Supervisors to the number of students in

the occupational program will show a positive relationship to the students' actual job held after graduation and students' job potential.

H_4: The proportion of Work-Study Administrators and Supervisors to the number of students in the occupational program will show a positive relationship to the job salaries of program graduates.

The second group of hypotheses deals with the relationship of students' grade point averages to job success factors.

H_5: The students' grade point averages will show a positive relationship to the D.O.T. classification of graduates' jobs.

H_6: The students' grade point averages will show a positive relationship to the proportion of students' available time actually employed after graduation.

H_7: The students' grade point averages will show a positive relationship to the difference between the students' actual job held after graduation and students' actual job potential.

H_8: The students' grade point average will show a positive relationship to job salaries of program graduates.

The third group of hypotheses deals with the relationship of the number of hours of counseling to job success factors.

H_9: The number of hours of counseling will show a positive relationship to the D.O.T. classification of graduates' jobs.

H_{10}: The number of hours of counseling will show a positive relationship to the proportion of students' available time actually employed after graduation.

H_{11}: The number of hours of counseling will show a positive relationship to the difference between the students' actual job held after graduation and students' actual job potential.

H_{12}: The number of hours of counseling will show a positive relationship to the job salaries of program graduates.

The fourth group of hypotheses deals with the relationship of the administrators' salaries to job success factors.

H_{13}: The Administrators' salaries will show a positive relationship to the D.O.T. classification of graduates' jobs.

H_{14}: The Administrators' salaries will show a positive relationship to the proportion of students' available time actually employed after graduation.

H_{15}: The Administrators' salaries will show a positive relationship to the difference between the students' actual job held after graduation and students' actual job potential.

H_{16}: The Administrators' salaries will show a positive relationship to the salaries of program graduates.

The fifth and final group of hypotheses deals with the assignment of students to Work-Study job stations related to students' major field to job success factors.

H_{17}: Assignment of students to Work-Study job stations related to students' major field will show a positive relationship to D.O.T. classification of graduates' jobs.

H_{18}: Assignment of students to Work-Study job stations related to students' major field will show a positive relationship to the proportion of students' available time actually employed after graduation.

H_{19}: Assignment of students to Work-Study job stations related to students' major field will show a positive relationship to the difference between students' actual job held after graduation and the students' actual job potential.

H_{20}: Assignment of students to Work-Study job stations which are related to the students' major field will show a positive relationship to salaries of program graduates.

Instrumentation

Data for the study were gathered by means of three questionnaires which were designed specifically by the investigator to provide student information.

Job success factors were created on the basis of Dictionary of Occupational Titles (D.O.T.). The investigator, using a system involving each occupation's relationship to Data, People, and Things, and the total level of complexity of the job, placed the occupations in which the graduates of work-study programs were employed on a scale of nine categories which indicated job success levels.

By use of intelligence test scores, each student's actual job potential was calculated.

Results of Study

Of the twenty hypotheses tested, significant correlations were noted in only seven cases. The significant correlations in hypotheses five through seven indicated that the more successful the student in his school work, the higher success rating he received on his job. The significant correlations noted for hypotheses seventeen through twenty indicated that the closer the correspondence between job skills learned by the graduates while they were in the work-study programs with the skills required for their jobs after graduation, the higher order of success they experienced in employment.

Conclusions

1. The vocational work-study programs investigated in this study seemed to uphold the original intent of the Vocational Education Act of 1963.
2. Relatively little attention appeared to have been given to the problem of guidance in the

work-study programs surveyed by this study. In the light of this circumstance and because of the fact that there should be very close correspondence between skills taught in the school program and the jobs entered by the graduates, it was suggested that more federal monies should be devoted to guidance, that the communication among work-study supervisors, counselors, instructors, and State Education Department officials be effected and that closer contact be maintained between work-study program directors and representatives of the various vocational groups drawing on the program graduates.

3. Further research in the areas of employer satisfaction with graduates, power of work-study programs, skill level improvement of students in programs, comparative success of rural and urban programs, and educational experiences contributing most to success of graduates.

ACKNOWLEDGMENTS

I am deeply indebted to the many who have given me information concerning the genesis, the past, as well as the current operation of the Vocational Work-Study Program funded under Public Law 88-210. Among them are: Mr. Joseph L. Lundari, Project Director, Vocational Work-Study Program, New York City; Mr. Joseph Salemi, Consultant, Vocational Work-Study Program, Rochester; Mr. Lester E. Williams, Director of Vocational Education, Schenectady; Mr. Joseph Fanella, Coordinator, Vocational Work-Study Program, Syracuse; Mr. George Kleitz, Director of Vocational Education; and Mrs. Ann Q. McDonald, Director, Bureau of Guidance and Pupil Personnel Services, Yonkers.

Others who have supplied me with invaluable details concerning this study are those people in the Bureau of Occupational Education Research, New York State Education Department, Albany.

I owe debts of gratitude to Dr. William F. Benjamin, Professor, Pre-service Elementary Teacher Preparation, Syracuse University, for his criticism of the manuscript. Not least of all, I wish to thank Dr. G. Orville Johnson, Professor, Special Education and Rehabilitation Department, Syracuse University, for his guidance and supervision throughout the course of the study. I also owe special thanks to Mrs. Jean B. Gilman and Miss Mary M. Casby for their many kindnesses and helpfulness in putting the manuscript into final form.

G. E. B.

CHAPTER I

INTRODUCTION

> While America is blessed with industrial power in the form of natural and human resources and technical skill, the individual, instead of becoming more secure and more important, is becoming increasingly more fearful and less significant in his social role and in his own eyes.[1]

According to the Education Policies Commission[2] a major goal of public education is "economic efficiency." The goal implies that every youngster, upon leaving public school, should be equipped to participate in the economy as both a producer and a consumer.[3] As universal education became more the reality and as automation lowered the availability of unskilled and semi-skilled jobs, more young adults were ill-prepared upon entering the job market.

[3] U.S., Office of Health, Education and Welfare, Vocational Education Act of 1963, P. L. 88-210 (Washington: U.S. Government Printing Office, 1964).

The late President John F. Kennedy, in his State of the Union Message to Congress on January 14, 1963, stated:

> The future of any country which is dependent on the will and wisdom of its citizens is damaged, and irreparably damaged, whenever any of its children is not educated to the fullest extent of his capacity, from grade school through graduate school. Today, an estimated four out of ten students in the fifth grade will not even finish high school--and that is a waste we cannot afford.[1]

This prediction was supported by a report, published in 1965 by the National Education Association pertaining to school dropouts, that approximately 40 percent of American youth leave school before completing the twelfth grade.[2]

The U.S. Department of Labor reported:

> During 1962, about one out of four non-white teenagers in the labor force was unemployed, compared with about one out of eight white teenagers. Since 1955, the jobless rate among Negro youth has risen twice as fast as among white. . . . Non-white girls have a much higher unemployment rate than any other group in the entire labor force. . . . Only about one-fifth of the young Negro workers with a high school diploma have white-

---

[2] Ralph W. Tyler, "Background," The School Dropout, Project: School Dropouts, ed. Daniel Schreiber (Washington: National Education Association, March, 1965), p. 5.

collar jobs; more than one-half of the young white workers have such jobs.[1]

In 1963, the President's Committee on Youth Employment reported that there were more than one million young men and women under 22 who had left school and who were unemployed. "At any given time 30% of the high school dropouts will be unemployed; even high school graduates average 15% unemployed." It is quite clear that there is little room in the labor market for the "undereducated, unskilled young worker." Lacking jobs, "their badge of belonging," reports the President's Committee, these young men and women represent "tomorrow's castoffs and chronic dependents, those who will live in poverty of body and mind, and who will bring up their children in their own image."[2]

In 1964, The American Council on Education[3] reported that one-fifth of out-of-school youngsters, under 21 years of age, was unemployed, the proportion being higher than that prevalent during the depression.

---

[2] Grant Venn, Man, Education and Work, Postsecondary Vocational Education (Washington: American Council on Education, 1964), p. 12.

[3] Ibid., p. 2.

The Research Division of the National Education Association[1] points out that one in every three ninth graders fail to finish high school.

Daniel Schreiber, in 1965, stated that according to national statistics a relationship existed between grade of leaving school and types of jobs: the lower the grade completed, the lower the job.

> Of all white 16-24 year old male dropouts employed in October, 1962, 17% of those who had completed only elementary school or less were farm laborers and another 17% were nonfarm laborers, compared with only 7% and 12%, respectively, for those completing one to three years of high school. Moreover, the proportion of craftsmen was noticeably smaller among white female dropouts, those who had not finished at least one year of high school were more likely to be domestic workers or farm laborers and less likely to be clerical or sales workers.[2]

Reports have indicated that many school dropouts have a number of common characteristics:

1. are 16 or 17 years of age and are retarded by one or more grades;

---

[1] Herbert Goldstein, "Social and Occupational Adjustment," Mental Retardation, ed. Harvey A. Stevens and Rick Heber (Chicago: The University of Chicago Press, 1965), p. 251, quoting The Research Division of the National Education Association.

[2] Daniel Schreiber, "The Rural School Dropout," Rural Youth in Crisis, Facts, Myths, and Social Change, ed. Lee G. Burchinal (Washington: U.S. Department of Health, Education and Welfare, Welfare Administration, Office of Juvenile Delinquency and Youth Development, 1965), p. 133.

2. are from low-income families;
3. are discouraged with their work or are failing at the time of leaving;
4. are dissatisfied with teaching methods;
5. have a feeling of 'not belonging';
6. leave because of the lure of the job;
7. are from weak or broken homes.[1]

According to Bedford and Steelhead,[2] the main reasons why boys and girls drop out of school are as follows:

1. laziness
2. lack of money
3. dissatisfaction in school
4. lack of encouragement at home
5. employment

Yet Grant Venn[3] states in Man, Education, and Work that "lack of interest" is by far the most frequent reason they give for leaving.

According to the United States Bureau of Labor

[3] Venn, op. cit., p. 2.

Statistics,[1] marriage was a major reason given by girls for dropping out. It was stated that even though few boys gave this reason, it may well have been a hidden incentive for boys who dropped out "to go to work" not because of the need for economic independence but as "a prelude to courtship and marriage."

Even though the image of the dropout is of a dull, rebellious individual, a study completed by the United States Bureau of Labor Statistics[2] in 1961, involving 22,000 students showed no substantial difference in intelligence between the dropout and his age group as a whole. For example, two-thirds of the dropouts were in the IQ range of 90 to 109.

During the 1960's, the U.S. Department of Labor, Bureau of Labor Statistics predicted that some 26 million new young people--with extremely varying preparation and capabilities--will seek to enter the labor market. At least 7.5 million will be school dropouts--equipped with few, if any, job qualifications; and 2.5 million of these dropouts will have had less than eight years of formal

schooling.[1,2]

In spite of some popular beliefs that dropouts are exclusively from working class and lower class or low income families, Miller reports that in Syracuse, New York, for example, "30 percent of the parents of dropouts were in white collar occupations."[3]

While dropping out of school is doubtless an inevitable fact of the educational process--it will continue to exist, so long as "successful" high school graduation is not compulsory.[4]

Although public concern has been addressed to the dilemma of the unemployed high school dropout, Capobianco and Jacoby[5] and Venn[6] discuss still another important problem--youth underemployment.

These facts, cited above, together with the predicted population increases were ominous. In a society

[6]Venn, op. cit., pp. 13-15.

rapidly demanding higher and more intensive training, fewer youth would have even marginally marketable skills.

Consequently the federal government inaugurated financial assistance programs to:

1. assist students directly by providing part-time work;
2. assist existing programs to add specialists in guidance, counseling, special education;
3. assist schools in initiating work-study programs.

Such programs are illustrated by the Vocational Education Act of 1963, P.L. 88-210; the Economic Opportunity Act of 1964, P.L. 88-452; and the Elementary and Secondary Education Act of 1965, P.L. 89-10.

The rationale behind all these programs can be summarized as the creation, upgrading, and addition of school offerings to persons between 15 and 21 years of age, both in and out of school. The support is available regardless of ability levels. Most employment opportunities will require a minimum of a high school education[1,2] although there is no expected decrease in the number of

[2] U.S. Department of Labor, Manpower-Challenge of the 1960's.

service level jobs.[1]

The single most important aim of a good education today is to inculcate in students a "receptivity" toward continuous education. Education must reflect a definite commitment to the tenet that learning is a lifelong process. This is especially true in vocational education because the technical growth of society causes "steady attrition and obsolescence among acquired skills."[2]

"Full employment in this country depends on full education."[3]

Statement of the Problem

A major concern of thoughtful people now is the vast sums of money that have been put into high school vocational programs since 1963. During the fiscal year ending June 30, 1966, for example, Congress approved the appropriation of $177,500,000 for P.L. 88-210. New York

[3] W. Willard Wirtz, Statement before the Subcommittee on Education, Senate Committee on Labor and Public Welfare, on S. 580, "National Education Improvement Act of 1963," April 30, 1963, p. 1.

State's actual share for school program youths from 15 through 20 years exceeded $3,000,000. In addition, federal funds in the amount of $225,000,000 have been authorized under the Law,[1] for the fiscal year ending June 30, 1967 and for each fiscal year thereafter. Yet the funds that have been specified for evaluation of the several different programs and research concerning their relative achievement of economic efficiency have been little and virtually ineffective.[2]

A review of the literature reveals that there are no projects in which the relative merits of the Vocational Work-Study Programs operating under P.L. 88-210 were studied for evaluative purposes and that no such research is currently being funded by the U.S. Office of Education.

The present study was so constructed as to identify aspects of the work-study programs that seem to be most closely related to job success among the graduates. In order to do this, it was necessary to identify factors involved in job success that could be used as criteria in determining which graduates had been the most successful occupationally. The Vocational Work-Study Programs

[1] Vocational Education Act of 1963, P.L. 88-210, 88th Congress, H.R. 4955, December 18, 1963.

[2] "The Vocational Education Act of 1963 (P.L. 88-210)," Vocational Education Needs in Oswego and Onondaga Counties (Utica: Part-Gray Publications, Inc.), p. 38.

included in the present study were those operated by the city school districts of New York City, Rochester, Schenectady, Syracuse and Yonkers.

Assumptions

1. It must be assumed for this study that school records are adequate, and accurate for the gathering of pertinent data.
2. It is assumed that the graduates' ratings of various aspects of their Work-Study Programs and their personal data will be accurate and relatively objective.
3. It is assumed that the data received from the Work-Study Administrators and Supervisors in all districts will be accurate.
4. While it is assumed that the Work-Study Administrators and Supervisors are certified for their positions, it must also be assumed that they may not necessarily be qualified to teach Vocational Work-Study Program high school students their job.

Limitations

1. Only five New York State urban school districts have been included in this investigatory study.

2. Only those senior students who were graduated in June, 1966, were chosen to be participants in this study.

3. Inasmuch as the population chosen for study was graduated in June, 1966, the degree of achievement within each student's selected field of work was limited to a seven month period available for actual full-time employment following graduation.

Significance of the Study

It is hoped that the present study will fulfill the following functions:

1. Provide guidelines for the development and administration of work-oriented vocational training programs in urban areas of New York State.

2. Provide information of value to school administrators in choosing those students who are eligible for participation in the Vocational Work-Study Program.

3. Provide decision-making information to the New York State Education Department in distribution of federal assistance and in the limitation or expansion of funds to future occupational programs for youth with special needs.

4. Provide the bases for future evaluation of funded work-study programs in other than the urban areas studied.

Job Success Criteria

There are five educational variables and four factors related to job success. These will be used as criteria to determine the relationship between students' economic efficiency level and the types of programs from which the students were graduated.

The educational program variables are:

1. The proportion of Work-Study Administrators and Supervisors to the number of students in the occupational program.
2. The students' grade point averages.
3. The number of hours of counseling.
4. The Administrators' salaries.
5. Assignment of students to Work-Study job stations related to students' major field.

The job success factors are:

1. The D.O.T. classification of graduates' jobs.
2. The proportion of students' available time actually employed after graduation.

3. The students' actual job held upon graduation and the students' actual job potential.

4. The job salaries of program graduates.

The hypotheses of this study are based on the foregoing educational program variables and job success factors.

Hypotheses

This study is designed to test twenty hypotheses. These hypotheses are arranged for the sake of convenience in five groups of four hypotheses each according to the educational programmatic factors involved.

The first four hypotheses deal with the relationship of the proportion of Work-Study Administrators and Supervisors to the number of students in the occupational program to job success factors.

H_1: The proportion of Work-Study Administrators and Supervisors to the number of students in the occupational program will show a positive relationship to the D.O.T. classification of graduates' jobs.

H_2: The proportion of Work-Study Administrators to the number of students in the occupational program will show a positive relationship to the proportion of students' available time actually employed after graduation.

H_3: The proportion of Work-Study Administrators and Supervisors to the number of students in the occupational program will show a positive relationship to the students' actual job held after graduation and students' job potential.

H_4: The proportion of Work-Study Administrators and Supervisors to the number of students in the occupational program will show a positive relationship to the job salaries of program graduates.

The second group of hypotheses deals with the relationship of students' grade point averages to job success factors.

H_5: The students' grade point averages will show a positive relationship to the D.O.T. classification of graduates' jobs.

H_6: The students' grade point averages will show a positive relationship to the proportion of students' available time actually employed after graduation.

H_7: The students' grade point averages will show a positive relationship to the difference between the students' actual job held after graduation and students' actual job potential.

H_8: The students' grade point averages will show a positive relationship to job salaries of program graduates.

The third group of hypotheses deals with the relationship of the number of hours of counseling to job success factors.

H_9: The number of hours of counseling will show a positive relationship to the D.O.T. classification of graduates' jobs.

H_{10}: The number of hours of counseling will show a positive relationship to the proportion of students' available time actually employed after graduation.

H_{11}: The number of hours of counseling will show a positive relationship to the difference between the students' actual job held after graduation and students' actual job potential.

H_{12}: The number of hours of counseling will show a positive relationship to the job salaries of program graduates.

The fourth group of hypotheses deals with the realtionship of the Administrators' salaries to job success factors.

H_{13}: The Administrators' salaries will show a positive relationship to the D.O.T. classification of graduates' jobs.

H_{14}: The Administrators' salaries will show a positive relationship to the proportion of students' available time actually employed after graduation.

H_{15}: The Administrators' salaries will show a positive relationship to the difference between the students' actual job held after graduation and students' actual job potential.

H_{16}: The Administrators' salaries will show a positive relationship to the salaries of program graduates.

The fifth and final group of hypotheses deals with the assignment of students to Work-Study job stations related to students' major field to job success factors.

H_{17}: Assignment of students to Work-Study job stations related to students' major field will show a positive relationship to the D.O.T. classification of graduates' jobs.

H_{1s}: Assignment of students to Work-Study job stations related to students' major field will show a positive relationship to the proportion of students' available time actually employed after graduation.

H_{1s}: Assignment of students to Work-Study job stations related to students' major field will show a positive relationship to the difference between students' actual job held after graduation and the students' actual job potential.

H_{2o}: Assignment of students to Work-Study job stations which are related to the students' major field will show a positive relationship to salaries of program graduates.

Definitions

In keeping with its purpose and intent, definitions 1 through 6 here cited are quoted from P.L. 88-210:

1. Vocational Education Act of 1963, P.L. 88-210

   It is the purpose of this part to authorize Federal grants to States to assist them to maintain, extend, and improve existing programs of vocational education, to develop new programs of vocational education, and to provide part-time employment for youths who need the earnings from such employment to continue their vocational training on a full-time basis,

so that persons of all ages in all communities of the State--those in high school, those who have completed or discontinued their formal education and are preparing to enter the labor market but need to upgrade their skills or learn new ones, and those with special educational handicaps--will have ready access to vocational training or retraining which is of high quality, which is realistic in the light of actual or anticipated opportunities for gainful employment, and which is suited to their needs, interests, and ability to benefit from such training.[1]

2. Vocational education

The term "vocational education" means vocational or technical training or retraining which is given in schools or classes (including field or laboratory work incidental thereto) under public supervision and control or under contract with a State board or local educational agency, and is conducted as part of a program designed to fit individuals for gainful employment as semiskilled or skilled workers or technicians in recognized occupations (including any program designed to fit individuals for gainful employment in business and office occupations, and any program designed to fit individuals for employment in occupations which the Commissioner determines, and specifies in regulations, to be generally considered professional or as required a baccalaureate or higher degree). Such term includes vocational guidance and counseling in connection with such training, instruction related to the occupation for which the student is being trained or necessary for him to benefit from such training, the training of persons engaged as, or preparing to become vocational education teachers, teacher-trainers,

---

[1] Vocational Education Act of 1963, p. 1.

supervisors, and directors for such training, travel of students and vocational educational personnel, and the acquisition and maintenance and repair of instructional supplies, teaching aids and equipment, but does not include the construction or initial equipment of buildings or the acquisition or rental of land.[1]

3. State

The term "State" includes, in addition to the several states, the District of Columbia, the Commonwealth of Puerto Rico, the Virgin Islands, Guam, and the American Samoa.[2]

4. Local educational agency

The term "local educational agency" means a board of education or other legally constituted local school authority having administrative control and direction of public elementary or secondary schools in a city, county, township, school district, or political subdivision in a State, or any other public educational institution or agency having administrative control and direction of a vocational education program.[3]

5. High school

The term "high school" does not include any grade beyond grade 12.[4]

6. Student eligibility

. . . employment under such work-study program shall be furnished only to a student who (A) has been accepted for enrollment as a full-time student in a vocational education program which meets the standards prescribed by the State board and the local educational agency for vocational education programs assisted

---

[1] Ibid., p. 6.
[2] Ibid., p. 7.
[3] Ibid.
[4] Ibid.

under the preceding sections of this part, or in the case of a student already enrolled in such a program, is in good standing and in full-time attendance, (B) is in need of the earnings from such employment to commence or continue his vocational education program, and (C) is at least fifteen years of age and less than twenty-one years of age at the commencement of his employment, and is capable, in the opinion of the appropriate school authorities, of maintaining good standing in his vocational education program while employed under the work-study program. . . .[1]

The remaining definitions are derived from other sources as indicated.

7. Federal, State or local "public agencies or institutions," as mentioned in Part 4 of Sec. C. of Part 2 of Sec. 13, "Work-Study Programs for Vocational Education Students," of P.L. 88-210, are suggested in Youth Work-Study Program, Summary and Suggested Development:

   Public agency; public institution

   Courts; housing authorities; libraries; mental institutions; municipal departments, such as, police, fire, welfare, and public health; parks and playgrounds; schools.[2]

8. D.O.T. job classification: (The occupational classification and code as used in the Dictionary of Occupational Titles)

   The occupations in the Dictionary have been incorporated into a classification structure in which the individual occupations are

---

[1] Ibid., p. 11.

[2] Youth Work-Study Program, Summary and Suggested Development (Albany, N.Y.: The University of the State of New York, The State Education Department, Divison of Special Occupational Services), p. 2.

identified by 6-digit code numbers. . . . Throughout this arrangement, jobs are grouped according to a combination of work field, purpose, material, product, subject matter, service, generic term, and/or industry, as reflected in the first three digits of the code. All occupations are grouped into nine broad categories, which, in turn, are divided into divisions and then groups . . . the last three digits of the code number can express the total level of complexity at which the job requires the worker to function.[1]

9. Specific vocational preparation (SVP)

The amount of time required to learn the techniques, acquire information, and develop the facility needed for average performance in a specific job-worker situation. This training may be acquired in a school, work, military, institutional, or avocational environment. It does not include orientation training required of even every fully qualified worker to become accustomed to the special conditions of any new job. Specific vocational training includes training given in any of the following circumstances:

a. Vocational education (such as high school commercial or shop training, technical school, art school, and that part of college training which is organized around a specific vocational objective);

b. Apprentice training (for apprenticeable jobs only);

c. In-plant training (given by an employer in the form of organized classroom study);

d. On-the-job training (serving as learner or trainee on the job under the instruction of a qualified worker);

---

[1]U.S., Department of Labor, Manpower Administration, Dictionary of Occupational Titles, Definitions of Titles, I (3d ed.; Washington: U.S. Government Printing Office, 1965), pp. xvi-xviii.

e. Essential experience in other jobs (serving in less responsible jobs which lead to the higher grade job or serving in other jobs which qualify).[1]

10. Job potential

The job potential of a student is determined by equating the student's IQ[2] with a job level derived from the D.O.T. The IQ range represented by the graduates included in the present study was distributed on a stanine scale as follows:

Stanine	IQ Range
1.	0 - 75
2.	76 - 83
3.	84 - 88
4.	89 - 94
5.	95 - 102
6.	103 - 108
7.	109 - 115
8.	116 - 122
9.	123+

It was found that there were 32 occupational levels represented by the graduates.

11. Work adjustment

The term work adjustment will refer to an individual's ability to perform his job to his employer's satisfaction.

12. Slow learner

The term slow learner will refer to those students whose measured intelligence quotients are within the range of 75 to 90.

---

[1] Ibid., p. 652.

[2] Intelligence test scores and grade point averages gathered in SHF, Section B are found in Appendix N.

13. Mentally handicapped

The term mentally handicapped will refer to those individuals whose measured intelligence quotients are within the range of 50 and 75.

14. Work experience

Work experience is a practical activity in the production or distribution of goods or services carried on under normal working conditions in business, in industry, in professional or institutional fields, or in the community, to further civic or occupational competence in youth.[1]

15. Advisory groups or committees

Advisory groups or committees are composed of several persons representing the various agencies interested in the cooperative work experience program. Usually included are school administrators, coordinator, businessmen, labor groups, and representatives of other agencies affected by the program.[2]

16. Business education

Business education includes any type of training for business occupations. Most experts now say that business education includes training for the two broad areas of distributive occupations and clerical office positions. The classes may be general in nature or they may have the vocational objective.[3]

17. Cooperative part-time work experience program

Cooperative part-time work experience program is a cooperative training program worked out together by the school, students, and

---

[1] Wilson H. Ivins and W. B. Runge, Work Experience in High School (New York: The Ronald Press Co., 1951), p. 4.

[2] Ibid., p. 165.

[3] Ibid.

businessmen. Students attend school part time and work part time in an actual job in the cooperating business. It is a planned and supervised on-the-job, work experience program, including training. It may be operated for any specific type of work or occupational area.[1]

18. Cooperative office practice work experience program

The cooperative office practice work experience program is a cooperative program in which the students work in office and clerical occupations.[2]

19. Coordination

Coordination refers to the functions and duties of the coordinator. These include making contacts with businessmen, students on the job, and parents, with making adjustments and trying to bring the material taught in the classroom into direct relationship with the student trainee's work experience on the job.[3]

20. Coordinator

The coordinator is the individual who is in direct charge of the cooperative work experience program. He coordinates, regulates, adjusts, and in many cases teaches the vocational class period. A school may have as many coordinators as it has cooperative work experience programs. A coordinator who also teaches is referred to as a coordinator teacher.[4]

---

[1] Ibid.

[2] Ibid.

[3] Ibid.

[4] Ibid.

21. Distributive education

Distributive education is a cooperative work experience program in which the students work in distributive occupation.[1]

22. Distributive occupation

A distributive occupation is one in which the worker is engaged in the distribution of goods or services. These workers may be distributing goods or services to consumers, retailers, jobbers, wholesalers, and others.[2]

23. Diversified occupations

Diversified occupations is a cooperative work experience program in which students work in any type of occupation and also attend school part time. A majority of such students are usually placed in trade and industrial occupations.[3]

24. Job instruction

Job instruction is the actual teaching and supervision given to student trainees on their jobs. A department head, manager, floorwalker, or other regular worker may give job instruction.[4]

25. Related-subjects class

A related-subjects class is one in which it is intended to broaden the vocational knowledge, understanding, morale, and judgment of the trainee. Background courses, such as business mathematics, speech, business letter-writing, mechanical drawing, and psychology are examples of related-subjects classes.[5]

---

[1] Ibid.

[2] Ibid.

[3] Ibid., p. 166.

[4] Ibid.

[5] Ibid.

26. Job station

A job station is any tax-supported institution which employs student learners for the purpose of training them and cooperates with the school in the cooperative work study program.

CHAPTER II

REVIEW OF THE LITERATURE

A Paradox

> All of the important formulations of education's social goals in this century have mentioned explicitly the school's responsibility for some kind of vocational education. In the Seven Cardinal Principles it was preparation for 'vocational efficiency.' Of the four major aims defined by the Educational Policies Commission, one was 'economic efficiency.' Three of the ten objectives listed by the National Education Association Committee on Social-Economic Goals of America were 'suitable occupation,' 'economic security,' and 'equality of opportunity.' Only a few voices have been raised in protest, insisting that formal education, at least through the 14th year, should be exclusively general in character and primarily intellectual, leaving to special agencies and institutes the task of vocational preparation. The predominant view, however, has been a cordial acceptance of considerable responsibility for vocational education.[1]

In spite of this open commitment of acknowledged responsibility for vocational education, Norman C. Harris[2] declares that one of the biggest tasks facing the

[2] Norman C. Harris, "Meeting the Post-High Educational Needs of the Vast 'Middle Group' of High School Graduates," Presentation to the Committee on Articulation of Schools and Colleges (Chicago: North Central Association of Colleges and Secondary Schools, March 19, 1963).

American high school today is to make its curriculum meaningful to students: this meaning must be found in curricula pertaining to the world of work. In effect, schools must become what Reissman and Hannah[1] refer to as "positive human."

Indeed, those students who plan on terminating their formal educational training upon completing high school should be enrolled in courses which will prepare them for their future occupations.[2]

Current curricula designed for non-college bound students are inadequate in terms of preparing youth for economic efficiency,[3,4,5] even though a major focus in education has been the ability of the high school student to have a saleable skill that is marketable in the world of work. This focus was aroused because of the heightening

statistical reports on dropouts, or as Labor Secretary W. Willard Wirtz states, "push-outs," teen-age unemployment, underemployment, automation and the lack of semi-skilled and unskilled jobs. That millions of today's youth have not received adequate occupational education authenticates a serious shortcoming of our educational system.

Taba writes:

> The curriculum has become 'the amorphous product of tinkering'--a patchwork. This piecemeal approach is continuing today, when additions and revisions in certain areas are made without reconsidering the entire pattern, and when acceleration in one part of the school system is recommended without corresponding changes in the next.[1]

In spite of the fact that millions in federal monies have recently been allocated for vocational school programs, the lack of evaluative data pertaining to vocational work-study programs makes it difficult to describe what has been done or what should be or could be done with these programs.

The History of Vocational Education

Until the advent by gradual stages of the Industrial Revolution in the eighteenth and nineteenth centuries, education for vocational competence was mainly left to the master-apprentice, father-son, proprietor-worker relationship.[1,2,3,4] With the advance of modern technology, however, an understanding of theory as well as practice became essential to the correct performance of many skills; the apprenticeship system was no longer adequate.[5]

In response to this situation first the Knights of Labor[6] and later the American Federation of Labor promoted not only technical training but general education for workers through night courses and vocational schools.

It was the American Federation of Labor that finally introduced a bill for federal support for vocational education.[1] The passage of this bill, The Smith-Lever Act, in 1914 set the stage for future government legislation in vocational education.

Federal Legislation and Federal Work Experience Programs

> The interest of the Federal Government in providing aid for education extends over a long span of years. . . . In its inception the interest was evidenced in legislation for the support of general education rather than specific programs of vocational education or of work experience.
>
> The general welfare clause (Art. 1, Sec. 8) of the Constitution has been found broad enough to warrant the use of federal funds for educational purposes throughout our history.[2]

The General Welfare Clause provides that: "The Congress shall have the power to lay and collect taxes, duties, imposts and excises, to pay the debts and provide for the common defense and general welfare of the United States. . . ."

Ivins and Runge state that the "constitutionality of Congressional acts applying to education has been upheld on this basis consistently."[3]

[2]Ivins and Runge, op. cit., p. 29.

[3]Ibid.

The Smith-Lever Act of 1914,

> provided for extension services by county agricultural agents, home demonstators, 4-H leaders, and specialists in agriculture and homemaking, and for the professional training of teachers in these subjects.[1]

It is significant that this was the first time in which states were required to match federal educational funds.

The Commission on National Aid to Vocational Education, created in 1914 by the Sixty-third Congress, expressed the belief that:

> . . . The Smith-Lever Act provides wisely and liberally through national grants to the States for agricultural education . . . yet the provisions . . . need to be supplemented by national grants to the States for teachers, supervisors, and directors of agricultural subjects in district agricultural high schools or in agricultural departments of rural high schools.[2]

The first of all direct federal aid to vocational education on the secondary level was the Smith-Hughes Act, passed in 1917, which allocates an annual expenditure of seven million dollars for trade and industrial, vocational agricultural and home economics education. Until 1963,

---

[1]Edgar L. Morphet, R. L. Johns and Theodore L. Reller, "The Federal Government and Education," Educational Administration: Concepts, Practices, and Issues (Englewood Cliffs, N.J.: Prentice-Hall, Inc., 1959), pp. 175-76.

[2]As quoted by Z. M. Smith, "Agricultural Education in Secondary Schools," Objectives and Problems of Vocational Education, ed. Edwin A. Lee (New York: McGraw-Hill Book Company, Inc., 1928), p. 84.

its major provisions were not amended and its state grants perpetually guaranteed.

During the period in which the act was signed, the majority of American workers were engaged in farming and industrial occupations. In addition to funds for teacher training and administrative services, the act provided for categorical restrictions alloting 50 percent for those "preparing to enter upon the work of the farm or farm home," and 50 percent for those "preparing to enter upon the work of a trade or industrial pursuit"; of the latter classification, 20 percent may be used for home economics instruction. These restrictions have been altered slightly by the 1963 amendment.[1]

> The act created a Federal Board for Vocational Education, composed of the Secretaries of Agriculture, Labor, and Commerce, the United States Commissioner of Education, and three citizens representing industry, agriculture, and labor. . . . By the end of the year all forty-eight states had, as the act required, submitted plans for approval; since few states had any relevant experience, these generally followed a uniform topical outline prepared by . . . the Federal Board staff. Because of this circumstance and the fact that the Smith-Hughes Act offered categorical aid only within narrowly defined limits, the Federal influence in the development of state programs was strong.[2]

---

[1] Venn, op. cit., p. 112.

[2] Ibid., p. 59.

Some of the stipulations were student eligibility, facilities, curriculum form and content, program grade and level, length of school week and year, and instructor and administrator qualifications.[1]

Previous to enactment of the Smith-Hughes Act in 1917, New York State's vocational education program had already developed. Without a doubt this earlier program was influential in the drafting of the original federal rules.[2]

> . . . The educational leadership administering the high schools in the early part of the twentieth century was concerned much more with college preparatory education than education to meet the needs of all pupils of secondary school age. Therefore, the Federal acts providing financial support for vocational education were, in actuality, a lay revolt from the prevailing educational leadership.[3]

Although some Federal control of vocational education was provided by the Smith-Hughes Act, much of the control was delegated to the states. This act and subsequent legislation greatly stimulated vocational education programs.[4]

[2] Norton, op. cit., p. 115.

[3] Morphet, Johns and Reller, op. cit., p. 177.

[4] Ibid.

> In 1929 Congress passed the George-Reed Act which authorized appropriations supplementary to those of the Smith-Hughes Act. They began at $500,000 and increased by that amount each year until a total of $2,500,000 was reached.
>
> The limited nature of the George-Reed Act caused apprehension among leaders in vocational education in 1934 as they looked forward to reduced programs resulting from discontinuance of its appropriations.[1]

When the George-Reed Act lapsed in that year, Congress passed the George-Ellzey Act, alloting three million dollars to be divided equally for vocational programs in agriculture, trades and industry, and home economics during the ensuing three years. The appropriations were to be on the basis of farm, non-farm, and rural populations in the states and territories.[2]

Russell,[3] in his discussion of the background of the George-Deen Act of 1936, expressed the belief that expiration of appropriations of the George-Ellzey Act indicated decreased federal support for vocational education, and thus, was responsible for efforts for enactment of additional aid legislation.

> The George-Deen Act gave tremendous impetus to both the cooperative distributive occupations and diversified occupation types of work experience programs. Its close adherence to the form

---

[1] Ivins and Runge, op. cit., p. 32.

[2] Ibid.

[3] Russell, op. cit., pp. 291-300.

> and intent of the Smith-Hughes Act is striking. Its chief feature was the addition of new funds to the broad general program initiated under the Smith-Hughes Act, and the guarantee of those funds on a permanent basis. The main innovation was the specific provision for distributive occupations training which could have been supported by Smith-Hughes funds but had not been for a variety of reasons.[1]

By 1933, the United States was in its greatest financial depression. Franklin D. Roosevelt's New Deal, which was designed to break the depression, included several measures to improve the economic situation of the people. Even though they were designed to be relief measures, many of them affected education.

In March of 1933, Congress enacted legislation creating the Civilian Conservation Corps (CCC) to relieve unemployment, specifically for the "relief and rehabilitation" of unemployed youth.[2,3]

> It is difficult to estimate the effect of the CCC program upon work experience in public schools. Certainly the demonstrated aversion of the public schools to cooperation with the CCC camp in a variety of ways indicated a negative effect. . . . It seems possible . . . that some part of the negative interest . . . may have come from an awareness that a federal agency could effectively do a job which the schools should, but could or would not do.[4]

---

[1] Ivins and Runge, op. cit., p. 33.

[2] Morphet, Johns and Reller, op. cit., pp. 177-78.

[3] Ivins and Runge, op. cit., p. 33.

[4] Ibid., p. 35.

By 1937, the CCC had developed an extensive educational program. There were 2.7 million enrollees participating in some type of educational program under the CCC between 1934 and 1941. The improved economic conditions of the early 1940's resulted in Congress' failure to continue appropriations for CCC and the agency was abolished in 1943.[1,2]

Another relief agency administered under the auspices of the Federal Emergency Relief Program was the National Youth Administration (NYA), which was even more closely linked with the public schools and colleges than the CCC. The NYA was established in 1935 by executive order for the initial purpose of providing work relief for unemployed youth of 16 to 25 years of age who were not full time students. The financial benefits of the agency motivated many high schools to initiated programs of work experience.[3,4]

> Many of the recommendations of NYA policy makers, and many improvements developed by individual schools, have since been incorporated into the work experience programs of high schools. The NYA plan of work experience was based on a primary need for financial aid to students. However, it also comprehended the goal of useful

---

[1] Ibid.

[2] Morphet, Johns and Reller, op. cit., p. 178.

[3] Ibid.

[4] Ivins and Runge, op. cit., pp. 35-36.

> learning to be gained from the work as well as from classroom activities. Consequently, a plan of in-school work experience was developed which obviated necessity for much cooperation with outside agencies.[1]

The NYA program was administered separately from all other Federal, state and local agencies. It was completely controlled by the Federal government and was not coordinated with state education departments until after 1940.

Between 1933 and 1940 some of the more important Federal relief agencies which implemented programs providing significant aid to the public schools and colleges were: the Civil Works Administration, the Federal Emergency Relief Administration, the Works Progress Administration, and the Public Works Administration. The primary purpose of these agencies was to provide work for the unemployed. They were all liquidated in the early 1940's.

In 1943, the Vocational Rehabilitation Act, P.L. 16, made provisions for disabled veterans of World War II, similar to those of P.L. 178 of 1918, designed for the vocational education of World War I veterans. The

---

[1] Ibid., p. 36.

Federal government supplied funds for the rehabilitation and training of disabled civilians, requiring matching state funds. This law was superceded by P.L. 113 of 1943, which gives Federal assistance to approved state programs for the vocational rehabilitation of injured persons.

The Vocational Rehabilitation Act and the "GI Bill," P.L. 346 of 1944, affirm federal interest on all school levels, including the secondary. The "GI Bill" provided liberal educational provisions for all World War II veterans, the length of training depending upon the length of service. This legislation enabled several millions of veterans to attend college. Korean War veterans received benefits of educational training under P.L. 550 of 1952.[1]

Further extension of the total vocational education program resulted from enactment of the George-Barden Act of 1946, which authorized twenty-nine million dollars to be spent "for the same purpose and in the same manner" as the seven million dollar appropriation of the Smith Hughes Act. The four chief aspects of the program

---

[1]Morphet, Johns and Reller, op. cit., p. 182.

remained essentially constant during the forty-year operational period: 1) the program was "of less than college grade"; 2) the major emphasis was upon rural areas; 3) funds were supplied only for that part of the program which had "immediate" value to the vocational training of the students; 4) it was necessary for all courses to be "useful" and "practical."

In 1957, Sputnik initiated an increasing concern for the weaknesses in the educational system and for the potential threat of these weaknesses in regard to national defense. The resultant effect of this concern was the National Defense Education Act (NDEA) of 1958.

Specifically, occupational education posed two problems: 1) restricted vocational facilities of small secondary schools; school districts were not consolidated at a rapid pace; and 2) extreme shortage of technical manpower in the areas of science and engineering. Provisions to meet these needs evolved as title VII of NDEA, for the purpose of training "highly skilled technicians in recognized occupations requiring scientific knowledge

. . . in fields necessary for the national defense." The section was titled "Area Vocational Education" and amended to the George-Barden Act as title III.

The realization that pre-service and vocational education programs were not effectively meeting the economic challenge of the new technology led to passage of the Area Redevelopment Act of 1961 (ARA) and the Manpower Development and Training Act (MDTA). The former is less significant, in that its appropriations were limited to $4.5 million for vocational training of unemployed and underemployed individuals in designated "redevelopment areas" and that duration of support could not exceed sixteen weeks.

The Manpower Development and Training Act extends the ARA provisions beyond chronically depressed areas to authorize training of unemployed and underemployed individuals who are unable to obtain full time positions with their present skills or who are not working to occupational potential.

Vocational Education Act of 1963

> The year 1963 was the most important in the legislative history of vocational education since 1917. A new Federal-State cooperative program was enacted into law, highlighted by broadened conceptions of education for work and by greatly increased appropriations.[1]

Congress was confronted with two distinct points of view while drafting the new legislation. One point of view suggested that all new legislation should be similarly patterned to the Smith-Hughes Act. The other stated that the Smith-Hughes and George-Barden acts should be repealed and a new start made. A compromise was reached under which the two former bills were amended. The restrictiveness of the two older acts was altered as current labor market needs mandated: ". . . a state may now transfer Smith-Hughes and George-Barden funds from any of the prescribed categories into any other occupational program."[2]

Definitions of categories have been considerably extended. For example, vocational agricultural funds may be utilized for training in "agricultural related occupations, without the traditional farm practice requirement."[3]

---

[1] Venn, op. cit., p. 124.

[2] Ibid.

[3] Ibid., p. 125.

The "intent of Congress was to foster flexibility, adaptability, and experimentation in a vocational education effort geared to technological change."[1]

Thus, the new legislation stipulates:

1. Periodic evaluations of the use of Federal money by the designated state board for vocational education must be justified in terms of the current and projected manpower needs of the state.[2]

2. Cooperative arrangements with the system of public employment services must be provided.[3]

3. The national administration of the program by the United States Commissioner of Education will be subject to the advisement of an independent advisory committee to relate the program to actual training requirements.[4]

4. The appointment of a national advisory council to recommend program improvements to Congress is required; it would be reconstituted during each five-year period of the program.[5]

The Vocational Education Act of 1963, as signed

by President Johnson, appropriates $60 million for the fiscal year ending June 30, 1964, $118.5 million for the fiscal year ending June 30, 1965, $177.5 million for the fiscal year ending June 30, 1966 and $225 million for the fiscal year ending June 30, 1967 and each fiscal year thereafter.[1]

Vocational Work Experience Programs--The Objectives

The fundamental tools of the "3 R's" are indeed necessary for successful vocational training. To wit, in a fairly recent edition of Newsweek, a United States Labor Department official pointed out, that

> to qualify for most MDTA training an applicant has to be 'trainable'--basically, educated, mentally and physically healthy, presentable and genuinely motivated to get and hold a job. And right there . . . you're missing most of the hard core 'unemployables.'[2]

If education is looked upon as a preparation for life then it seems only logical that experience which will foster socially approved community adjustment should underlie our curricula. Surely, education should open the door to the world of ideas, but should it not also

---

[1] Ibid., Part A, Sec. 2, p. 1.

[2] "The 'Unemployables,'" Newsweek, November 7, 1966, p. 84.

introduce students to the world of work?

The concept of vocational education can be made more lucid by comparing vocational education to general education. The relationship which exists between these two types of education may be stated as follows:

1. Controlling purpose--General education should prepare us to live more intelligently. . . . Vocational education should prepare us to work more efficiently. Both are necessary. . . .

2. Subject matter taught--. . . general education should give training in the general information . . . and . . . in the general tools of learning needed to help us learn more about life and about our vocations . . . efficient vocational education gives specific training in the usable skill and knowledge for each occupation taught.

3. Groups served--General education is designed to serve everyone during the period of compulsory school attendance . . . and to continue this service through high school and beyond for anyone desiring it and able to profit by it--irrespective of their vocational interests and plans. Efficient vocational education for any employment can be given successfully only to those who are being prepared for such employment or who are already employed in it. . . .

4. Their sequence--General education now precedes vocational education, which uses it as a foundation. The former, as has already been pointed out, aims to provide a background of general knowledge and use of

> elementary tools of learning needed for vocational training. The latter gives points, purpose, significance, and application to the former. . . .[1]

In more explicit terms, the primary objectives for the high school work experience programs are presented only to show that compatibility prevails between the vocational and the general educational goals.

Ivins and Runge propose the following primary and secondary objectives in the order of their importance:

Primary Objectives:

1. The promotion of good student attitudes toward work.
2. The promotion of good student work habits.
3. The encouragement of desirable traits of character.
4. The promotion of feelings of self-respect and achievement in students.
5. The promotion of cooperative attitudes in students.
6. The promotion of student guidance, including some vocational preparation.
7. Making possible a limited supervised introduction of students to the activities and demands of the normal work world.[2]

Secondary Objectives:

1. Promotion of good employee-employer or worker-work supervisor relationships.
2. Development of job intelligence and imagination is student workers.
3. Development of student competence in the management of personal finances.

[2] Ivins and Runge, op. cit., p. 99.

4. Development of specific vocational skills in students.
5. Motivation of school nonwork experience program.
6. Development of interest in the school's regular or nonwork experience program in those students who respond best or only to real-life situations.
7. Development of general, elementary vocational skills.[1]

Advantages of Cooperative Work Experience Programs

Some of the most valuable vocational training may be provided on a pay-roll job when it is coupled with guidance of the work and associated by related instruction. The plan of alternating work and study has enabled many students to make better progress in school work and, at the same time, to develop competence on the job.

The cooperative work experience program can be a real school and community service. In addition to providing opportunities and benefits for students, it makes for a more effective school program. Also, it has values for employers as well as for the general community.

To Employers

1. Provides a source of trained employees.
2. School selects and provides better qualified employees.

---

[1] *Ibid.*, p. 105.

3. Provides a steady source of part-time and potential full-time workers.
4. Mutual cooperation provides better training programs.
5. School saves employers' expense of training.
6. More efficient employees mean greater profits for business.
7. Proper selection and training reduce labor turnover.
8. Gives businessmen a part in total school program.

To the Student Trainees

1. Gives training balanced between theory and practice.
2. Prepares many for type of work for which they are adapted.
3. Increases contact with realities of life.
4. Provides actual work experience.
5. Money can be earned while learning.
6. Provides valuable on-the-job training.
7. Assists in developing ability to get along with people.
8. Provides increased chances for advancement.
9. School credit for on-the-job training.
10. May make school more interesting and meaningful.
11. Develops self-confidence and other personality factors.
12. Provides terminal vocational training for those unable to continue schooling.
13. May provide marketable skill to aid student in more advanced training.
14. Offers chance to complete high school to some who might drop out.
15. Leads to permanent full-time employment.
16. Motivates interest in school subjects.
17. Provides tryout-occupational experience which should make possible a better choice of life career.

To the School

1. Provides better school-community relations
2. Stimulates businessman's interest in school.
3. Economical, in that business establishments furnish laboratory for training.
4. Broadens educational service of the school.
5. Enriches the curriculum and makes it more effective by knowing needs of businessmen.
6. Helps keep teachers informed on current business needs and trends.
7. Students have greater interest in school.
8. Holding power of school increased.
9. Develops and makes use of community resources by the school.
10. Adds to vocational school offerings with little expense.[1]

Slow Learners

The objectives of education are derived from the culture. As the culture consists of the ideals, ideas, methods of thinking, skills, attitudes, institutions, and other man-made aspects of environment, whatever ends the school attempts to achieve will be ends recognized as desirable in the cultural system to which the school belongs.[2]

However, schools, uniquely viewed, are in a sense cultures. Gillian writes that these "cultures" education individuals, possibly in ways which are not part of the

---

[1] Ibid., pp. 231-32.

[2] B. Othanel Smith, William O. Stanley, and J. Harlan Shores, "The Validation of Educational Objectives," Fundamentals of Curriculum Development (New York: Harcourt, Brade and World, Inc., 1957), p. 107.

conscious goals and design.[1] That which is exercised within these "cultures," namely the curriculum has been viewed by noted educators as "a strategy . . . a sound calculation,"[2] or "a sequence of potential experiences . . ."[3] or "the total effort of the school to bring about desired outcomes. . . ."[4]

The chief aim of education, as stated by the Commission for the Reorganization of Secondary Education in 1918, is:

> The purpose of democracy is so to organize society that each member may develop his personality primarily through activities designed for the well-being of his fellow members. . . . Consequently, education . . . should develop in each individual the knowledge, interests, ideals, habits, and powers whereby he will find his place and use that place to shape both himself and society toward even nobler ends.[5]

[5] National Education Association, The Cardinal Principles of Secondary Education, Commission for the Reorganization of Secondary Education (Washington: N.E.A., 1918), p. 7.

Elaborating upon these aims, the Commission proposed the Seven Cardinal Principles as the basic objectives of secondary education. They are: 1) health, 2) command of fundamental processes, 3) worthy home membership, 4) vocation, 5) citizenship, 6) worthy use of leisure, 7) ethical character.[1]

Each of the above declarations either implies or clearly states economic efficiency as being one of the main aims of our established goals of education.

Still joblessness is painfully apparent in America today. Thousands of unemployed youth cast about at loose ends.[2]

Interestingly, the following statement was written by Howard M. Bell, in 1938:

> A very large percentage of youth assert that economic security is their most urgent personal need. The problem of unemployment is very great, but even employed youth face serious difficulties. Rates of pay tend to be low; hours tend to be long; a majority of youth with jobs must contribute to the support of families. Many youth are in blind alley jobs. Some are in jobs which they will shortly lose because of advancing age. Many more aspire to enter professional and semi-professional fields than are at all likely to be

---

[2] U.S., Department of Labor, The Challenge of Jobless Youth (Washington: U.S. Government Printing Office, 1963), p. iv.

> accommodated, and the majority are forced into unskilled or only slightly skilled occupations.[1]

Tragically, the nation's educational system is, when viewed as a whole, in what Edward Chase describes as "a gross imbalance; its attention concentrated on the 20% of students who go through college."[2] As Reissman and Hannah point out, school is "too often a bookish place--rigid, formalistic, prissy."[3]

Through personal interviews, adverse school experience was the major, single reason given by 1,600 dropouts. They voiced boredom with school subjects, dislike of teachers, or other general complaints. "The school records showed that over 45 percent of all the dropouts had IQ's of less than 90 and about one-third had IQ's of less than 85. . . ."[4]

Unemployment falls heaviest on the less academically talented and to the degree that a local educational agency does not make the necessary provisions to

educate the slow learner to his maximum potential, to that degree it is creating school dropouts.

True the slow learners

> . . . are problem learners in school because of their limited rate and level of development. They are adjustment problems because of the innumerable failure and frustrating situations they encounter while they are growing up--situations that under present conditions they can do little or nothing about. They are behavior problems, but not just because of their inability to meet the demands of their environment. The majority of the group are reared in the slum areas of the community, where certain kinds of deviate behavior is not only condoned but in many instances actually encouraged.[1]

Special educational provisions have not been considered essential for slow learners since they do not deviate as markedly from children of average ability as do the other groups of mentally retarded children. In 1958, it was asserted that:

> The slow learners are the highest intellectual group of retarded children and are largest in number. They form the . . . school population that can not quite 'keep up' and are usually doing the poorest work in the regular classroom. Slow learners are essentially normal in their emotional, social, physical, and motor development. Even in intellectual development the slow learners are at the lower fringe or range of the normal group. Thus, while they are retarded and

---

[1] G. Orville Johnson, Education for the Slow Learners (Englewood Cliffs, N.J.: Prentice-Hall, Inc., 1963), pp. 3-4.

> consequently have difficulty in 'keeping up' with the rest of the class, their deviation is not so great that they cannot be adequately educated in a regular classroom situation.[1]

Among the general school population, 15 to 17 to 18 percent[2] of the student body can be considered slow learners. The most obvious characteristic of the slow learners is their inability to stay on the same grade level as the rest of the class. For the most part, they are assigned to classes with average and above average students, which practice eventually has a detrimental effect upon their egoes and self-concepts. Since failure is their constant companion through their school careers, they have good reason to doubt whether they are good at anything.

> Shop or homemaking programs plus 'social promotion' in the required academic subjects enable school administrators to 'graduate' these pupils. This practice falls far short of contributing to the goal of American education for citizenship and self-realization.[3]

Work experience programs, both in-school and

---

[1] G. Orville Johnson, "The Education of Mentally Handicapped Children," Education of Exceptional Children and Youth, ed. William M. Cruickshank and G. Orville Johnson (Englewood Cliffs, N.J.: Prentice-Hall, Inc., 1958), p. 190.

[3] Marguerite B. Slack and Mark A. Boyer, "The Slow Learner in the Academic High School," Educational Leadership, XXI (March, 1964), 380.

out-of-school have been incorporated into existing curricula for slow learners by some rather "progressive" school districts.

A work-study program can be an important appendage of carefully planned school experiences designed to develop attitudes and behaviors relevant to vocational adjustment. The work-study program can provide an excellent opportunity to explore student attitudes in relation to the world of work. It can also provide an additional opportunity for the further broadening of occupational information and not only desirable but necessary work attitudes. The students' work experience can be utilized to supplement the classroom program.[1]

In an article appearing in the May, 1964, School Management Journal, it is stressed that while work-study programs are regarded "fine in theory, they don't work. Specifically, the students don't work." They are concerting their efforts toward the wrong types of jobs, and, as a result, they can't find work.

Superintendent Horace S. Oliver stated:

---

[1] Preparation of Mentally Retarded Youth for Gainful Employment, A Study sponsored jointly by the U.S. Office of Education, the U.S. Office of Vocational Rehabilitation, and the Project on Technical Planning of the American Association on Mental Deficiency (Bulletin No. 28, 1959), p. 28.

> Under too many programs a student is placed in a position without too much consideration . . . he works at odd jobs, such as sweeping floors, running errands and the like . . . when school is out . . . he goes off looking for a job himself.[1]

Often, programs supposedly designed for slow learners become a "dumping ground"; the students who are assigned to these programs are those whom their teachers did not want in their classes.

If the above definitions of curriculum are viewed as valid, then is our "strategy" sound? Is our "sequence of potential experiences" in concert with the American ideal of a democratic system of education? Is "the total effort of the school to bring about desired outcomes" designed for a group free from academic pathology?

Mentally Handicapped

Special classes for the mentally handicapped were first organized in the public schools in the late nineteenth century.[2] From these initial efforts the programs have expanded into the thousands servicing hundreds of thousands of mentally handicapped children.

---

[1] "Des Moines, Iowa: Industry Trains--and Hires--Vocational Students," School Management, VIII (May, 1964), 134.

[2] Johnson, "The Education of Mentally Handicapped Children," Education of Exceptional Children and Youth, p. 190.

The general objectives of education are as applicable to the mentally handicapped as they are to children with greater intellectual endowment. Inasmuch as their limited intellectual abilities define the extent to which the mentally handicapped can achieve these four objectives, namely:

1. The objectives of self-realization.
2. The objectives of human relationship.
3. The objectives of economic efficiency.
4. The objectives of civic responsibility.[1]

stated objectives for them often include only the first three. Realistically, the goals of an educational program for the mentally handicapped may then be stated as personal, social, and economic adjustment. The fourth objective, civic responsibility, "usually can be achieved to such a small degree that the only contribution made to society and to civic welfare is incidental."[2]

A planned special education program for the

---

[1]Educational Policies Commission, Policies for Education in American Democracy (Washington: National Education Association, 1946), p. 47 as quoted by G. Orville Johnson, "Introduction," A Comparative Study of the Personal and Social Adjustment of Mentally Handicapped Children Placed in Special Classes with Mentally Handicapped Children who Remain in Regular Classes (Syracuse University Research Institute, Office of Research in Special Education and Rehabilitation, February, 1961), p. 1.

[2]Ibid.

mentally handicapped includes 12 years of school experience. In order to achieve the general educational objectives, stated above, the 12 year program is customarily organized in four age groupings: primary, intermediate, junior high, and secondary. "Progression from one group to the next is based on chronological age and achievement according to ability."[1]

On the junior high school level, school experiences are typically related to vocational interests and to the need for information relating to jobs. Placement into the senior high school program is based on the assumption that the mentally handicapped students are now ready for a work-school type of program.

Work-study programs in special education have formed the basis of the curriculum.

Engel writes:

> There is probably no aspect of education of mentally retarded children which is more important than that which concerns itself with the social and occupational adjustment in adult life. Every teacher in special education is concerned with the end result of his training and struggles to prepare his young people so that when they leave

---

[1] Preparation of Mentally Retarded Youth for Gainful Employment, p. 6.

> school, they will be able to adjust successfully to jobs, to home life, and to their own social group.[1]

If the curriculum for the mentally handicapped does not take into account vocational and social experiences,

> . . . he is being expected to do the very thing in which he is known to be the weakest. Without help he is expected to transfer skills and information acquired in school to life situations. . . . He must adjust in competition with adults of normal intelligence, a group with whom he has never been able to compete on equal terms either in the school or in the community.[2]

According to Kirk and Johnson,[3] the local educational agency is in a strategic position to develop a postschool program[4] for the mentally handicapped.

> (1) The school has been in contact with the children for a number of years and being responsible to their training is well acquainted with individual abilities, personalities, and specific

[3] Ibid., p. 242.

[4] Ibid. The postschool program "would start at the time the mentally handicapped youth may legally leave school until he has made an economic and social adjustment in the community."

> training that has been provided. (2) The school has trained personnel (special class teachers, psychologists, and counselors) available to provide the necessary services. (3) The school has the necessary training facilities (various shops in the secondary and vocational schools to provide needed specific supplementary training).[1]

In the work-study program incorporated to facilitate a successful change from school to work, the student usually spends part of the day or week in acquiring work experience and in learning specific job skills. The balance of the student's time is spent in school settings. A few programs have been organized so that the student, for a period, spends full time in the job training program and then alternates this with a period of full-time school attendance.[2]

The community's economic conditions and the scope of occupational opportunities available will determine and direct the nature of the work-experience.

Individual work experiences must take into account the ability of the employer to be a positive factor in the development and training of the students.

---

[1] Ibid., p. 244.

[2] Proceedings of a conference on Special Problems in Vocational Rehabilitation of the Mentally Retarded, U.S. Department of Health, Education and Welfare, Vocational Rehabilitation Administration, Rehabilitation Service Series No. 65-16 (Madison, Wisc.: November 3-7, 1963), p. 35.

A major advantage of this type of program is that it permits an assessment of the pupil's problems in adjusting to work and extends an opening for relating school and work-training activities.

The more the occupational preparation program simulates an actual work situation, the greater its efficacy. The work training may take place in private business and industrial settings within the community, in nonprofit institutions, or in specialized programs which may be developed by public and private funds.[1]

Evaluations of special educational curricula show how program variables can actually influence success on the job. It is generally agreed that traits other than intelligence are influential in determining the individual's job success. Studies report that among the important variables are attitudes toward school and work, emotional stability, and peer relationships.[2]

In 1922, Wallin stated:

> It is a fact that we cannot adequately diagnose a child's educational or social capacity or

---

[1] Ibid., p. 36.

[2] Statements by J. J. Beckham, K. M. Cowdery, J. E. W. Wallin, T. M. Abel and E. F. Kinder, as reviewed by Herbert Goldstein, "Social and Occupational Adjustment," Mental Retardation, ed. Harvey A. Stevens and Rick Heber (Chicago: The University of Chicago Press, 1964), p. 248.

> prognose his industrial capability by intelligence tests alone. . . . The danger to be avoided in the educational and industrial classification of children and adults is the tendency to lean too exclusively on intelligence tests and scores and to minimize the importance of comprehensive analysis.[1]

Although studies point out researchers' efforts to establish minimum mental age levels for occupations, Burr, in 1931, stated this was touching on only one facet of a complex situation:

> . . . It is also essential that . . . the counsellor should not rely wholly upon the results of the mental tests, but take into account the total situation surrounding each individual.[2]

Channing,[3] in 1932, reporting on graduates of special class programs isolated the factors below:

1. specialized training helps insure job success;
2. in school achievement is related to on-the-job success;
3. good work in school was directly associated with longer employment on a single job, with greater pay increases and longer job mean duration.

---

[1] Wallin, as quoted by Herbert Goldstein, Ibid.

[2] E. T. Burr, as quoted by Herbert Goldstein, Ibid.

[3] Alice Channing, Employment of Mentally Deficient Boys and Girls, United States Department of Labor, Bureau Publication No. 210 (Washington: U. S. Government Printing Office, 1932).

As his leading introductory statement, written for "A Study of the Personal Characteristics Desirable for the Vocational Success of the Mentally Deficient," H. Michal-Smith points out that:

> It has been established that personality traits are very largely responsible for the success or failure of the mental deficient in industry; that a retardate with good personal characteristics very often proves more efficient than another retardate with an identical IQ but less favorable traits.[1]

In 1965, Barrett, Relos and Eisele reported their study[2] as further evidence that IQ alone may not mirror the "true nature of the total mental ability of the retarded." Seated within the realm of conjecture, it is suggested that "those retardates who were successful were able to think on a higher reasoning level."[3]

Kolstoe[4] followed the progress of forty-one

---

[1]H. Michal-Smith, "A Study of the Personal Characteristics Desirable for the Vocational Success of the Mentally Deficient," American Journal of Mental Deficiency, LV, 1 (July, 1950), 139.

[2]Two groups of mentally retarded were matched in terms of means and range for IQ and age. They had approximately similar backgrounds of education and training. One group of 58 men and women was determined to be vocationally successful and the group of 57 men and women was designated as unsuccessful.

[3]Albert M. Barrett, Ruth Relos, and Jack Eisele, "Vocational Success and Attitudes of Mentally Retarded Toward Work and Money," American Journal of Mental Deficiency, LXX, 1 (July, 1965), 106.

[4]O. P. Kolstoe, "An Examination of Some Characteristics Which Discriminate Between Employed and Non-Employed Mentally Retarded Males," American Journal Of Mental Deficiency, LXVI (1962), 472-82.

successful and non-successful trainees who had been through Southern University Employment Evaluation and Training Project Center. He found that the vocationally successful group was clearly superior to the unsuccessful group in physical, social, and work characteristics.

Phelps[1] reported in 1966 the records of 105 males and 58 female graduates of special classes. In addition to a relationship between IQ and job success, it was also discerned that efficiency on the job and behavior acceptable to peers were related to success.

Peckham[2] found that the most frequent reason given for job termination by clients of vocational rehabilitation was that they were the targets of teasing, ridicule, and practical jokes on the part of their fellow workers. Peckham reported that the retarded workers demonstrated lack of social and vocational sophistication by disregarding rules for punctuality, dress and general deportment. Their responses to teasing and ridicule were immature.

That this conflict between retarded and normal

[2] R. Peckham, "Problems in Job Adjustment of the Mentally Retarded, American Journal of Mental Deficiency, LVI (1952), 448-53.

workers is not transitory was shown in 1954 by Brainerd,[1] who found that it sometimes took as long as two years for retarded workers to be accepted as regular employees by their fellow workers.

Goldstein,[2] in 1964, stated that while studies indicate that the retarded change jobs for reasons of personal choice based on the nature of the work, they may often be motivated to change by the rejection of their fellow workers.

In pursuit of students' attainment of successful personal adjustment to a vocational situation, Kokaska,[3] in 1964, candidly reported that it is easier to train students if we initially assist them in coping with the emotional demands met while working.

There are indications of other important variables in related literature. Hollingshead,[4] from his empirical data of Elmtown, reports the tendency for youth to follow parental occupations.

---

[4] A. B. Hollingshead, Elmtown's Youth (New York: John Wiley and Sons, 1949).

Kirk and Johnson[1] and Keys and Nathan[2] mention the theoretical debate between programs that utilize job stations to teach specific jobs and programs that utilize them to teach generalized attitudes and skills.

In honoring the latter approach, Goldstein and Heber, in 1959, stated that when criticisms have been directed to school work programs, they have been directed toward those programs which have been too limited in the types of jobs students are exposed to and for providing students with unrealistic work experiences. They go on to say these criticisms are not applicable when the work programs are designed not for the purpose of teaching but rather to provide students with the types of general experiences which they will be faced with upon entering the world of work. Specific job skills can be learned while on the job.

> The in-school program is most useful when it stresses attributes which may be generalized to any job situation such as the relationship of the worker to the employer and vice versa, concepts of punctuality, socialization, and task completion.[3]

---

[1] Kirk and Johnson, op. cit.

[2] N. Keys and J. Nathan, "Occupations for the Mentally Handicapped," Journal of Applied Psychology, XVI (1932), 497-511.

[3] Goldstein and Heber, "Summary of the Conference," Preparation of Mentally Retarded Youth for Gainful Employment, p. 29.

Due to prevalent misconceptions about intelligence, the genesis of progressive vocational programs for the mentally handicapped has been hindered. Misconceptions no doubt have narrowed the realm of possible vocational opportunities. The following six statements exemplify commonly held misconceptions.

> The IQ has been too frequently regarded as a highly efficient predictor of an individual's level of vocational and social adjustment. . . . As a consequence . . . intelligence test scores have been used as rigid criteria for the selection or rejection of individuals for placement in education and rehabilitation programs with little or no regard for other important variables. . . .
>
> Some assume that the mentally retarded show a rapid turnover in jobs, while others believe that a mentally retarded individual once placed on a job tends to remain in that position permanently. A belief in the former assumption has resulted in a reluctance of employers to employ, and placement counselors to place, mentally retarded students. The results of a belief in the latter assumption can be seen in those public school programs . . . which place great stress on the acquisition of specific job skills to the neglect of more general vocational attributes. Neither of these assumptions is supported by research.
>
> . . . the retarded do as well as, and even better than normals on what are described as repetitive, monotonous tasks . . . this notion has, in many instances, led school and rehabilitation personnel to seek and place students in jobs requiring repetitive operation at the expense

of an exploration of other possible vocational opportunities . . . this widely held assumption is backed by little or no experimental evidence.

. . . the retarded demonstrate a lack of persistence. Such a belief has adversely affected the willingness of employers to hire the mentally retarded as well as the willingness of counselors to place these students in many kinds of jobs. This notion has little support in research, with some data indicating that the mentally retarded do not fall short of normals in measures of persistence.

The mentally retarded are regarded by many as being highly suggestible . . . little data are available to support this notion with at least one study finding no significant differences between normals and retarded in degree of suggestibility.

. . . the retarded are accident prone. Because of workmen's compensation provisions, this belief, perhaps more than any other, has made employers hesitant in hiring retarded workers. . . . The limited research evidence available suggests . . . that the retarded may be somewhat less susceptible to accidents than their co-workers of average, or better intelligence.[1]

This very point was stressed again in the 1963 conference.[2]

The following discernible conclusions of follow-up studies by Fairbanks, Baller, and Kennedy are pertinent to this study:

The majority of higher grade mentally retarded persons will make an acceptable adjustment in their communities. . . .

---

[1] Ibid., pp. 36-38.

[2] Special Problems in Vocational Rehabilitation of Mentally Retarded, p. 36.

> Higher grade mentally retarded persons in the community are hard hit occupationally in times of economic depression, while they appear to lose out in steady jobs, they get more than their share of part-time jobs. . . .
>
> . . . Occupationally, the mentally retarded persons appear to cluster at the semiskilled and unskilled end of the scale.[1]

Again, Channing, in her study concerning the work histories of former special-class students in Newark, New Jersey; Rochester, New York; Detroit, Michigan; Cincinnati, Ohio; and Los Angeles, San Francisco, and Oakland, California provided the following conclusions:

> (1) Under ordinary circumstances, the large majority of boys and girls graduating from special classes will become occupationally placed. (2) Like other youngsters just out of school they will tend to change jobs in the early years of employment. (3) Compared with the general population, their record of unemployment might be expected to be slightly higher. (4) They tend to cluster in the semiskilled and unskilled categories of employment. Positions held in other categories are essentially low level for the category. (5) Termination of jobs in, for the most part, voluntary. Only a small proportion of the terminations was imposed by the employer for inefficiency or misconduct.[2]

In considering reasons for termination of jobs, Johnson forwards an opposing opinion:

> . . . There is little in the way of intellectual abilities that they can use to compensate

---

[1] Goldstein, op. cit., pp. 241-42.

[2] Ibid., p. 245.

> for any lack in the personal and social adjustment areas. The importance of healthy and appropriate attitudes as well as social skills is pointed up in a number of studies. For example, it has been found that the majority of the mentally handicapped who have lost their jobs have done so for non-manual reasons. . . . Unhealthy attitudes, unrealistic aspirations, and lack of social skills have caused their dismissal from the job.[1]

In appraising the occupational outlook for the retarded, Goldstein indicates that the picture is far from encouraging. Occupational categories, such as laborers' jobs in industry, private household workers, farm laborers, once the province of the retarded, have been decreasing markedly in the past half-century. "Predictions of experts indicate that this trend will persist, but at a reduced rate."[2]

Much of the absence of available jobs for the mentally handicapped:

> . . . may be attributed to technological changes wrought by automation and mechanization in industry, on the farm, and in homes. Competition for remaining jobs has become more keen because of the large pool available for such work.[3]

Goldstein points out the critical role that training programs as well as counseling and services for

[2]Goldstein, op. cit., p. 254.

[3]Ibid.

the retarded are already playing in their social adjustment.

> Unless these services maintain an effective level of contribution, it may be necessary to consider the advisability of providing sheltered work settings for these retardates similar to those now typical for the trainable mentally retarded.[1]

The review of research reveals that differences affecting job success do exist. Many specific variables have been identified and are included in the present study along with certain other variables identified above from related research and theory.

Summary

Will the Vocational Education Act of 1963 be the catalyst which will escort appropriate types of curricula complimenting modern technology into our public schools or will history repeat itself by allowing the benefits of vocational education to fall into the hands of fortuity?

Will the Vocational Education Act of 1963 serve as a vehicle in providing better trained, more highly educated persons to fill the needs in semiskilled, skilled,

---

[1] *Ibid*.

technical, and semiprofessional occupations, or will the Act be looked upon, in years to come, as having become decadent?

Indeed, our pioneer fathers who were responsible for the enactment of the Smith-Lever Act and the Smith-Hughes Act expressed allegiance to the inherent right of each individual to be educated to his optimal level. Yet, despite this firm commitment to counteract standardized formulae of mass education, Norton's[1] 1938 report concerning vocational education in New York State clearly articulates that far too many graduates were unable to reach the established levels of attainment in some types of courses, e.g. agricultural, commercial and homemaking courses. The reasons most frequently mentioned were: low intelligence, lack of responsibility, home environment, poor personality and lack of interest in the work.

Norton[2] exemplified inadequacies of the instructional staff: 1) teaching preparation programs are unsystematic, 2) many vocational industrial teachers are not qualified, and 3) that most commercial teachers do

---

[1]Norton, op. cit., p. 46.

[2]Ibid., pp. 99-102.

not keep themselves up-to-date in such areas as business trends, technological developments, et cetera.

Two different additional statements, both published in 1964, confirm Norton's findings.

Grant Venn[1] wrote that many of the students who are enrolled in vocational and technical educational programs are the dropouts or castoffs of the academic program. In many instances, the instructional staff members are less academically oriented and they receive relatively low status within the field of education.

George Arnstein stated that there exists a propensity to send our least-abled students and most troublesome students to vocational classes. The classrooms are often equipped with teachers who have the least education. "The teachers are often the ones who failed to make good at their trade or are victims of technological change."[2]

The interpretation of the slogan, "equal opportunity for all," has proven to be the active generator of educational programs which do nothing more than propel

---

[1]Venn, op. cit., p. 34.

[2]Arnstein, op. cit., p. 67.

imbalances in curricula. Hence, the dropouts might be more appropriately referred to as "pushouts." As previously quoted, of the 1,600 dropouts interviewed, 45 percent had IQ's of less than 90 and about one-third had IQ's of less than 85.[1]

Now that there is public recognition of the special needs of slow learners, and provision in the Act for students with special educational handicaps, perhaps boredom with school will succumb to interest nurtured by a definite feeling of "belonging."

Will the mentally handicapped student, who by definition is one whose mental faculties exonerate him from exposure to typical curricula, benefit from the Act? Will he be the recipient of the provisions stipulated?

> Vocational education for persons who have academic, socio-economic, or other handicaps that prevent them from succeeding in the regular vocational education program.[2]

The work-study program for the mentally handicapped so often patterned after the diversified "cooperative" training program, has been fruitful in some

---

[1] U.S., Bureau of Labor Statistics, op. cit., p. 6.

[2] Vocational Education Act of 1963, Part A, Sec. 4(a), (4), p. 3.

instances; yet, as indicated,[1] many programs have been too limited in the scope of jobs a student is exposed to and for providing a student with unrealistic work experiences.

Due to technological changes, jobs falling within the province of the mentally handicapped, have been decreasing rapidly. Will it be necessary to consider placing the mentally handicapped in sheltered workshops similar to those designed for the trainable mentally retarded?

In considering eligibility of program participants, should there be any limits concerning intelligence as long as the students are seriously interested and minimally qualified?

Bluntly, Arnstein indicates that the Vocational Education Act of 1963:

> . . . should open the door to a new educational orientation which is part of our changing industrial society--or it will merely make more money available to train more youngsters in more obsolescent skills, and do a mediocre job of training at that.[2]

CHAPTER III

PROCEDURES

This study will identify and describe major vocational work-study program variations in five major New York State city school districts. Data received from seniors, graduated in June, 1966, who had participated in Vocational Work-Study Programs financed under PL 88-210, will be compared with and related to data obtained from 1) New York City, 2) Rochester, 3) Schenectady, 4) Syracuse, and 5) Yonkers school districts.

Selection of Population

Approximately 45 percent of the school districts in New York State are presently operating Vocational Work-Study Programs under the Vocational Education Act of 1963, P.L. 88-210. The school systems identified for examination in the study are: 1) New York City, 2) Rochester, 3) Schenectady, 4) Syracuse, 5) Yonkers. These cities were chosen because they represent a) major population areas, b) earliest developed vocational

work-study programs, c) variation of large metropolitan and middle-sized cities, d) cross-sectional geographic areas. Profiles of each city's vocational education programs are contained in Appendix A.

The investigatory study was concerned with senior students[1] who had commenced, continued or returned to a full-time vocational program via the reimbursement granted them through P.L. 88-210.

Under the suggestion of Dr. Donald Myers, Associate Professor of Educational Psychology, Syracuse University, it was pre-determined that from the participating work-study membership, 20 percent of the seniors enrolled in each of the programs during the academic year September, 1965-June, 1966, would be randomly selected as subjects.[2] Furthermore, the 20 percent would be equated for boys and girls to reduce variation due solely to sex

---

[1]The five New York State cities under investigation collectively submitted a listing of 1,049 graduated students who participated in the Vocational Work-Study Program during the 1965-1966 academic year. From this listing 246 students were selected as sample members. See Table 3, p.

[2]Even though 20 percent of the senior student population, for each of the local educational agencies included in this investigatory study, was considered ample for statistical significance by Dr. Donald Myers, Associate Professor of Educational Psychology, Syracuse University, he suggested utilizing Schenectady's total senior student enrollment due to the size of the program.

differences. All seniors meeting study criteria in Schenectady were made eligible since the total population was limited to 46 students, 14 boys and 32 girls. Syracuse had 148 active participating students, thus the selection of students was 15 boys and 15 girls. Rochester's list of 206 seniors provided the sample population with a total sum of 41 students, 20 boys and 21 girls. Yonkers submitted 172 names, from which 34 subjects were chosen, 17 boys and 17 girls. A list of 477 names was forwarded as being representative of student participants from 27 of the 29 high schools from New York City operating Vocational Work-Study Programs.[1] The 20 percent sample from New York City designated 95 students to be included in the study, 47 boys and 48 girls.

Instruments

Three questionnaires, The Program Descriptive Factor Sheet (Appendix I), The Student History Form, Section A (Appendix F), and The Student History Form, Section B (Appendix G), developed by the investigator specifically for this study, were utilized to serve as

[1]Two high schools never responded even though they were contacted five times after the initial letter, concerning the request of the names of all senior students of the 1965-1966 academic year, was mailed.

the basis in pointing out significant job success factors.

The Program Descriptive Factor Sheet (PDFS)

All data referring to specific school district programs during the 1965-1966 academic year were entered on this questionnaire form. The variables measured include the following:

a. Year program was developed and the origin of it.

b. The number and job titled of personnel.

c. The student enrollments and number of graduates.

d. The number, kind, remuneration, and location of job stations.

e. The scheduling of the program and types of records maintained.

The Student History Form (SHF), Section A

All data concerning the subject's high school record and post-school employment were collected on the SHF. The variables included:

a. Person responsible for student enrollment in the Work-Study Program.

b. Job stations assigned.

c. Time spent in school and at work.

d. Salaries paid.

e. Family background information.

f. Number, types, salary and duration of jobs held since June, 1966 and/or reasons for unemployment.

Explanation and Utilization of the D.O.T. Classification System for Purposes of This Study

Each job was rated in terms of degree of relationship to job stations. On this form, questions were also asked concerning attitudes toward the school-work program.

Each job was rated in terms of its D.O.T. classification and Specific Vocational Preparation as outlined in The Dictionary of Occupational Titles.[1] All occupations recorded in the Dictionary are grouped into nine broad categories, which, in turn, are classified into divisions (see Appendix K).

The occupations have been incorporated into a

---

[1] Dictionary of Occupational Titles, Vol. I.

classification system in which each occupation is identified by a 6-digit code number. The first 3 digits provide a definition of each occupation's category, division, and group. The last three digits of the code number refer to the requirements made of a worker and the job's specific relationship to Data, People, and Things.

Together, the last three digits of the code number can express the total level of complexity at which the job requires the worker to function.[1]

A job's relationship to Data, People, and Things may be expressed by identifying the highest appropriate function in each hierarchial 8-point scale, which the job requires the worker to have. The lower the number, the more complex is the task. The above information is contained in Table 1.

Specific Vocational Preparation refers to the amount of time necessary to learn "the techniques, acquire information, and develop the facility needed for average performance in a specific job-worker situation."[2]

Table 2 provides an explanation of the nine levels of specific vocational preparation. The higher the

(See Appendix J for Definitions of Functions)

TABLE 2

NINE LEVELS OF SPECIFIC VOCATIONAL PREPARATION[a]

Level	Time
1	Short demonstration only.
2	Anything beyond short demonstration up to and including 30 days.
3	Over 30 days up to and including 3 months.
4	Over 3 months up to and including 6 months.
5	Over 6 months up to and including 1 year.
6	Over 1 year up to and including 2 years.
7	Over 2 years up to and including 4 years.
8	Over 4 years up to and including 10 years.
9	Over 10 years.

[a]U.S. Department of Labor, Manpower Administration, Dictionary of Occupational Titles, Definition of Titles, II (3d ed.; Washington: U.S. Government Printing Office, 1965), p. 653.

number, the more time that is required to learn the techniques, acquire information and develop the facility needed for average performance.

In order to arrive at a D.O.T. classification level for the purpose of this study, the investigator added the last three digits of each job, which, in turn, were added to a digit indicating a specific level of vocational preparation.

Yet, as the lower the number representing the relationship among the worker and Data, People and Things indicated job complexity and the higher the number for Specific Vocational Preparation denoted greater length of time required to learn job techniques, et cetera, the investigator subtracted the nine levels of vocational preparation from ten in order to reverse the ranking. Thus, the more complex the job, the greater the amount of time necessary to become qualified for the job.

The Student History Form (SHF), Section B

Personal data, e.g., achievement test reports, intelligence test results, anecdotal records, absenteeism,

grades and number of counseled hours received, and type of school program were included and completed by the investigator from school records.

Development of the Survey Instruments: The Preliminary Questionnaires

As no formal investigatory study had been done previously to discover strengths and/or weaknesses of Vocational Work-Study Programs operating under The Vocational Education Act of 1963, four tentative questionnaires were designed to serve as the basis in pointing out significant job success factors:

1. Program Descriptive Factor Sheet (Appendix B)
2. Student History Form (Appendix C)
3. Graduate Work History Form (Appendix D)
4. Personnel Information Form (Appendix E)

Suggestions for the individual items appearing on the original four questionnaires were secured from The Vocational Education Act of 1963, P.L. 88-210; from an earlier investigatory study pertaining to vocational education;[1] and the October 1964 issue of the American Vocational Journal.

---

[1] Max U. Eninger, The Process and the Product of T & I School Level Vocational Education in the United States: The Product (Pittsburgh: The American Institutes for Research, 1965).

The original questionnaires were then modified in the light of expert opinion.[1,2,3,4,5,6]

The Student History Form was eventually divided into two sections A[7] (Appendix F) and B (Appendix G), and the Graduate Work History Form was incorporated into Section B of the Student History Form.

In recognition of the positions the work-station supervisors may hold and of the merit of their ability, the Personnel Information Form was completely deleted.

Modifications, additions, deletions and/or suggestions for the general format of the tryout questionnaires were later secured from Youth Work-Study Program, Summary and Suggested Development;[8] and personal

interviews.[1,2,3,4]

The questionnaires were once again submitted to the New York State Education Department, Division of Special Occupational Services for re-examination. The purpose of this step was the deletion of ambiguous, overlapping, or otherwise faulty items and the addition of questions which might be asked from raw data made available from participating school districts' reports or from those senior students who were active participants in the 1965-1966 Vocational Work-Study Program.

Revisions of the Survey Questionnaires

Program Descriptive Factor Sheet (P.D.F.S.)

Even though the original Program Descriptive Factor Sheet was revised twice, all questions appearing on the first form were maintained, but additional questions, relevant as to program effectiveness were added.

1st Revision: Section II. Program History

A. How Initiated:

1. Was there a Work-Study Program prior to the Vocational Education Act Program?
Yes___ No___

2. Required modification of former program?
Yes___ No___ If it was a modification, list specific changes:

3. Extension of Work-Study Program?
Yes___ No___

B. 1. Number and Titles of members on Screening and/or Advisory Committee:

2. What is their functional definition of eligibility for student participation in the program?

3. Who is (are) responsible for student placements?

4. a. Have periodic evaluations been made to determine effectiveness of the work-study program in terms of the program's objectives?

b. How frequently?

c. By whom?

5. Evaluation of student's work is performed by whom?

6. How are students solicited to participate in the work-study program?

F. Average length of student stay in Program.

G. How many students 15 years of age
16 years of age
17 years of age
18 years of age
19 years of age
20 years of age

H. b. How many of the 1965-1966 participants had previously dropped out of school?

Section III. Curriculum

B. Questions concerning the location of work-stations were elaborated to determine whether all student placements were made within the schools or if other tax-supported agencies were involved, and, if so, the size and types of agencies utilized.

(Fill in Percentages)

	Trade and Industrial		Business Education	
	1965	1966	1965	1966
In School				
Small Business (To 12 employees)				
Moderate Business (To 200 employees)				
Large Business				
Totals	100%	100%	100%	100%

Section IV. Scheduling

B. Hours per week for counseling:

Individual ___ Group ___

C. 1. Who determines the academic subjects taken by students?

2. a. Who interrelates academic subjects with the work-experience phase of the program?

b. Amount of time allowed for this?

3. Evaluation of on-the-job experience performed by whom?

4. Programs of vocational education are to be geared to labor market needs, both immediate and future. Who is responsible for this type of reporting?

5. Is there any coordination of the counseling services offered by the schools and the employment services? If so, who is responsible for this coordination?

a. Have periodic evaluations been made to determine effectiveness of the work-study program in terms of the program's objectives?

b. How frequently?
a. Start of program
b. Midway _____
c. End _____
d. Other _____

F. How many boys
15 years of age ___
16 years of age ___
17 years of age ___
18 years of age ___
19 years of age ___
20 years of age ___

How many girls
15 years of age ___
16 years of age ___
17 years of age ___
18 years of age ___
19 years of age ___
20 years of age ___

H. 5. How many job station supervisors worked with seniors, September, 1965--June, 1966?

6. Maximum amount of students job station supervisors may have had, 1965-1966.

2nd Revision: Section III. Curriculum

D. Average number of jobs assigned per student:
a. 1 ___
b. 2 ___
c. 3 ___
d. 4 ___
e. more than 4 ___

Section IV. Scheduling

C. 2. c. What measures have been taken to correlate work station experiences?

2. d. Who is responsible for this?

Section V. Evaluation of Student

c. by Program Coordinator

(Explain)

Student History Form (S.H.F.)

When the original proposal was submitted to the New York State Department of Education for approval, the Student History Form, although seemingly terse, appeared adequate for the study's intentions. However, it was apparent after judicious inquiry that some of the items asked of the students were perhaps intimidating and would possibly threaten the necessary return of questionnaires.

Items appearing under Sub-sections entitled, Test Results and Grades, were eliminated from the form. However, as it was thought that this data was valuable in determining program effectiveness, the Student History Form was divided into Sections A and B. Items then appearing on Section A were to be answered by the students; answers to the items appearing on Section B were to be gathered by the researcher.

It was also suggested that in two instances the verbiage be altered: specifically, the words "instigation" and "own initiative." The term "Work Theory Courses" was thought inappropriate and this was

subsequently transformed into two sections: 1.) Industrial Arts Courses and 2.) Approved Vocational Program.

Revision 1

In October another Student History Form was designed which still embraced many of the items appearing on the first form. Yet not only did elaborations of previous questions seem fitting but additional inquiries now deemed necessary. Suggestions for general lay-out of items were proffered by several data processing employees.

Recorded changes made were:

Who was the person(s) responsible for your enrollment in the Work-Study Program?

(1) Guidance Counselor	___	(5) Principal	___
(2) Teacher	___	(6) Friend	___
(3) Homeroom Teacher	___	(7) Self	___
(4) Parent	___		

The genesis of the question, "If you did not graduate, year you left school." stems from Section 2B of Section 2c of Section 13 of Public Law 88-210,

> . . . is in need of the earnings from such employment to commence or continue his vocational education program. . . .

Precise meaning was given to the term "Rating"

which appeared in the incipit form. Officially, ratings became earmarked Dictionary of Occupational Titles (D.O.T.).

Under father's or guardian's and mother's or guardian's education level, students were to be presented with five alternatives, ranging from less than 8 years of formal education exposure to completion of four years of college.

Students were to be asked for the first time for a more thorough picture of their indigenous backgrounds in order to be able to see if their patterns in school as well as their work experiences were consonant with their siblings.

The listing of brothers and sisters was to be dichotomized according to those siblings who were NOT in school and those who were NOW in school. School grade completed as well as current job, if any, were also asked.

Revisions 2 and 3

The second and third revised copies of The Student History Form conformed mainly to the first

revised model until the third formal revision, when finally The Graduate Work History Form (G.W.H.F.) became part of S.H.F.'s constitution. The only changes were those pertaining to the structure and placement of the questions.

Graduate Work History Form (G.W.H.F.)

Original Form

Initially, The Graduate Work History Form merely asked for a listing of all jobs the students have had since graduation, June, 1966. Space was provided on the form for D.O.T. rating; the mean salary, the mean duration of time spent on the job(s).

Revision 1

In addition to the work history asked of each student, attitudes concerning the vocational work-study program were requested (Questions, Section A. 1, 2, and 3). Types of work-stations and major duties and duration of job assignments were listed as question A4.

Inquiry concerning the students' current work

status and job description were addended (Section b. 2a.--e.).

The final interrogative sentences under Section B were:

> 3. Did you have a job when you left school in June, 1966? Yes ___ No ___
> If not, how many weeks did it take you to get your first job?

Employer's Job Contract	

Section V. Records Maintained

	Date Originated
Employee's Job Contract	
Evaluation of Student	
by Supervisor at Work (Circle one: weekly, monthly, per job)	
by Teacher (Vocational) (Circle one: weekly, monthly, per job)	

The second and final revision of The Program Descriptive Factor Sheet encouraged further probing into

the design of each school district's program. Being explicit, these inquiries led to the following questions.

II. A. Program History

4. Student participants are drawn from how many high schools? ___ from how many junior high schools? ___

II. B. 2a. Administrator's salary ___ for ___ months.

2b. Was there an increase for those teachers and/or work-station supervisors participating in the Vocational Work-Study Program? Yes ___ No ___

If Yes, how much? ___

4. How many weeks have you been unemployed since June, 1966?

5. How many friends do you have at work? ___ (This question was later dropped due to the difficulty at arriving at a suitable definition.)

Revision 2

The Graduate Work History Form still remained a separate entity, with major changes affecting particularly the general format of the questionnaire.

Alternatives for questions (where appropriate) were listed: Section A, 5b. and c.; Section B, 1, 2b., 3b., 4, 5.

Question A. 4. appeared for the first time on the G.W.H.F. "While you were in the Work-Study Program, did you ever meet with anyone to talk about problems on your job(s)?

Yes ___
No ___

If yes, who, number of times individually; number of times on a group basis."

Revision 3

Only two changes called for a third revision. Firstly, it was thought the title, Graduate Work History Form could be dropped and that continuous numbering and lettering in proper chronological order should be employed, combining The Student History Form with The Graduate Work History Form.

Secondly, more appropriate limits were designated for those questions advancing alternatives.

Pretest and Re-test of the Student History Form--Revision III

On January 4, 1967 the questionnaire was submitted in person to two boys and eight girls who were active participants in The Vocational Work-Study Program

in Syracuse and who were graduated in June, 1966.[1] Each individual was given a sealed envelope which contained a copy of The Student History Form, a letter of introduction,[2] and an envelope for the questionnaire's return. These ten work-study program graduates were randomly selected from the list of the senior 1965-1966 participants originally submitted by the school system.

All questionnaires were completed with no apparent difficulty. A two-week period ensued before a re-test, utilizing nine of the ten subjects[3] took place on January 18, 1967.

The Pearson r correlation technique was used to indicate the degree of reliability. As such a high degree of reliability was apparent, we could assume that the questionnaire was also valid. The correlations are shown in Appendix I.

Three different statistical techniques, the Kendall-Tau, the Pearson product moment, and the Point Biserial, were utilized to test the data.

---

[1] Arrangements had been made, however, to meet with 16 graduates--8 boys and 8 girls.

[2] See Appendix H.

[3] One student was drafted into the service before the re-test date.

Five educational variables and four factors related to job success were selected to be used as criteria to determine the relationship between students' economic efficiency level and the types of programs from which the students were graduated.

The Kendall-Tau rank correlation technique was used for hypotheses 1 through 4. These hypotheses were concerned with the degree of correspondence which existed between the proportion of Work-Study Administrators and Supervisors to the number of students in the occupational program and the four job success factors.

The Pearson product moment correlation method was employed to measure the intensity of relationship between the students' grade point averages and the selected four job success factors (hypotheses 5 through 8). This same statistical method was again used for hypotheses 9 through 12--to determine the degree of significance between the number of hours of counseling and the job success variable.

The Kendall-Tau rank correlation technique was repeated for hypotheses 13 through 16 to measure the mark

of correspondence between the Administrators' salaries and the four job success factors.

For hypotheses 17 through 20, assignment of students to Work-Study job stations related to their major field and the four job success variables, the point-biserial technique was used.

CHAPTER IV

RESULTS

Introduction

Chapter IV presents an analysis of the data obtained in this investigatory study. The primary concern of this study was to identify aspects of work-study programs that seem to be most closely related to graduates' job success. In order to do this, it was necessary to identify factors involved in job success that could be used as criteria in determining which graduates had been the most successful occupationally. The Vocational Work-Study Programs of five New York State city school districts were included in the present study.

Three questionnaires were designed to serve as the basis for investigating significant job success factors:

1. Program Descriptive Factor Sheet (Appendix I)
2. Student History Form, Section A (Appendix F)
3. Student History Form, Section B (Appendix G).

The results of these questionnaires were analyzed in terms of: 1) the proportion of work-study administrators and supervisors to the number of students in the occupational program; 2) the D.O.T. level of graduates' jobs; 3) the proportion of students' available time actually employed after graduation (June, 1966-January, 1967); 4) students' actual job held upon graduation and students' actual job potential; 5) the job salaries of program graduates; 6) the grade point average of students; 7) the number of hours of counseling; 8) the administrators' salaries; 9) assignment of students to work-study job stations related to their major field of study in school; and 10) intelligence test results.

Three different statistical techniques were employed:

1. Kendall-Tau
2. Pearson product moment
3. Point Biserial

The first section of this chapter includes the data concerning each of the variables listed above as

recorded on the questionnaires. The second section contains the data found through statistical analyses.

Program Descriptive Factor Sheet

In order to present a clear, concise, comparative picture of each city's program, an item-by-item analysis is recorded below.

Program History

1. Was there a Cooperative Work-Study Program prior to the Vocational Education Act Program?

New York City

There were seventeen Cooperative Training Programs in accounting, bookkeeping, business machines, clerical practice, recordkeeping, retailing, stenography, typewriting, automotive trades, design, dressmaking, food trades, machine shop, millinery, needle trades, hospital aide, and plastics.

Rochester

The Rochester City School District offered five cooperative training programs.

The Cooperative Office Practice Program (1932)

The Cooperative Retail Program (1935-1942, started again in 1964)

The Edison Technical Industrial High School Cooperative Work Program (1935)

The Cooperative School Work Program (1959)

The Occupational Education Program (1959)

Schenectady

In Schenectady, there were cooperative training programs.

Cooperative Industrial Training
- Automobile Parts Manager
- Automobile Service Station Attendant
- Automobile Body Repairman
- Electrical Appliance Repairman
- Furniture Upholsterer
- Dry Cleaner
- Baker
- Copper-plate Printer
- Canteen Service Repairman
- Meat Cutter
- Silk Screen Specialist
- Greenhouse Worker

Cooperative Retailing

Cooperative Practical Nursing

Cooperative Office Practice

Syracuse

Prior to November 1, 1965, there were four types of work-study programs.

1. Office Occupations Work Experience Program
2. Sales Occupations Work Experience Program
3. School To Employment Program (STEP)
4. Special Education Work Study Program

Yonkers

The Industrial Cooperative Program was an integral part of the Yonkers School District's prior to the Vocational Work-Study Program.

Cooperative Training Programs included programs in printing, electrical wiring, automatic heating, carpentry, machine shop and auto mechanics.

2. Required modification of former program?

All cities responded, No.

3. Extension of Work-Study Program?

All cities responded, No.

4. Student participants are drawn from how many high schools? From how many junior high schools?

New York City

How many high schools? 61
How many junior high schools? 36

Rochester

How many high schools? 9
How many junior high schools? 0

Schenectady

How many high schools? 2
How many junior high schools? 5

Yonkers

How many high schools? 2
How many junior high schools? 0

II. B. 1. Number and Titles of members on student Screening and/or Advisory Committee:

Each school district reported the same answer--there exists no screening or advisory committee per se; however, a number of school personnel members representing various capacities may be involved in reviewing prospective work-study students. In each city, the chief consultant on, or, co-ordinator of, the Vocational Work Study Program, or as in the City of Yonkers, the Director of Vocational Education, has the privilege of either honoring the requests made by the school personnel (or, as in some cases, the requests made by the students themselves), or refusing admittance if the student does not

meet all necessary qualifications. Requests for student enrollment into the Vocational Work-Study Program may be forwarded by:

Principals
Vice-principals
Guidance counselors
Department chairmen
Deans of boys
Deans of girls
Classroom teachers

For any given student any combination of the above listed school-community members may serve as a "committee."

2. a. Administrator's salary for ten months.

New York City	$16,170
Rochester	11,650
Schenectady	10,810
Syracuse	11,050
Yonkers	11,000[1]

b. All cities reported that there was no increase in salary for these teachers and/or work station supervisors participating in the Vocational Work-Study Program.

3. The <u>functional</u> <u>definition</u> of student eligibility for participation in the program?

Each urban area included in this study quoted the

---

[1]Salary quoted is that of the assistant to the Director of Vocational Education.

definition of "student eligibility" as recorded in P.L. 88-210. Tersely stated each student must be:

a. enrolled, on a full-time basis, in a vocational education program which acknowledges the standards prescribed by the State board and the local educational agency.[1]

b. in need of financial assistance to commence, continue, or return to, an approved vocational education program.

c. at least fifteen years of age and less than twenty-one years at the commencement of his employment.

4. Who is responsible for student placement?

The chief consultant[2] on, or coordinator of, the Vocational Work-Study Program. In Yonkers, it is the Director of Vocational Education.

How are students solicited to participate in the work-study program?

New York City and Yonkers

Through guidance counselors at each school, and school-wide announcements made by the principal and/or his assistants.

---

[1] Yonkers City School District specifically stated only point A.

[2] Due to the size factor, each New York City school involved in the program has a work-study school supervisor. In reference to question 4, he would be responsible for student placement.

Rochester

1. Students may be approached by any member, or a "committee of" school-community personnel members.

2. Announcements are made in the high schools' newspapers.

3. Letters are sometimes forwarded to those students who may have previously worked in a cooperative training program or who were previously "employed" in the Vocational Work-Study Program. Statements concerning the work-study program are also addressed to those students who have expressed an open and active interest in the program.

4. Announcements are made in the schools.

Schenectady

Publicity for the work-study program in Schenectady is handled on an informal basis largely by the vocational education teachers. In this way all qualified students are made aware of the program and encouraged to participate.

Syracuse

1. In-school publicity

   Schools' newspapers
   Bulletins
   Announcements

2. In-school interviews

   a. Work-Study Program coordinator and the New York State Employment Counselor.

   b. Guidance department personnel and students.

3. Referrals from various community social agencies.

C. Length of Program

The Vocational Work-Study Program was originally financed in all the urban areas in this study in March of 1965.

Funding of this work-study program for the 1965-1966 academic year began in October in three of the cities included in this study, New York City, Schenectady, and Yonkers, and in November for the remaining two cities, Rochester and Syracuse.

D. Number of graduating participants
   1965-1966: Trade & Industry: Business Ed.: Other: Total

Due to the magnitude and scope of the program this request made of the school districts seemed unreasonable. For instance, in New York City 2,950 students participated in the 1965-1966 program. Rochester processed and placed 1,115 boys and girls. Schenectady, however, did have the information and readily made it available:

1965-1966 June Graduates

Vocational	Business Education	Technical	Total
16	26	4	46

E. Average length of student stay in Program.

	Approximately in weeks
New York City	32
Rochester	25
Schenectady (graduates only)	23
Syracuse	26
Yonkers	30

F. How many boys and girls: 1965-1966 academic year

Years of Age	New York City	Rochester	Schenectady	Syracuse	Yonkers
15-16	760	554	65	197	223
17-18	2,000	502	81	194	183
19-20	190	59	6	77	0
Total	2,950	1,115	152	468	406

G. How many of the 1965-1966 senior participants had previously dropped out of school?

New York City	Rochester	Schenectady	Syracuse	Yonkers
20	0	0	6	0

H. 1. Number of Vocational Work-Study Administrators and Supervisors.[1]

New York City	Rochester	Schenectady	Syracuse	Yonkers
640	440	49	108	29

2. Total number of students participating in the Work-Study Program, 1965-1966

New York City	Rochester	Schenectady	Syracuse	Yonkers
2,950	1,115	152	468	406

3. Number of senior participants, 1965-1966

New York City	Rochester	Schenectady	Syracuse	Yonkers
477	281	46	149	68

4. Number of graduating participants: 1965-1966

New York City	Rochester	Schenectady	Syracuse	Yonkers
477	281	46	149	68

---

[1]School personnel as well as job station supervisors.

5. How many job station supervisors worked with seniors, September, 1965-June, 1966?

New York City	Rochester	Schenectady	Syracuse	Yonkers
N.A.[1]	N.A.	33	N.A.	N.A.

6. Maximum amount of students job station supervisors may have had at one time, 1965-1966?

New York City	Rochester	Schenectady	Syracuse	Yonkers
3	Typical 1[2]	3(A-V Dept)	Typical 1[3]	Typical 1[4]

III. Curriculum

A. Job Stations

New York City, Rochester, Schenectady, Syracuse and Yonkers

Jobs requiring the greatest skills, most frequently mentioned were:

Machine room assistants
Audio-visual assistants
Laboratory assistants
Key-punch operators
Librarian's assistant
Typists

The least-skilled jobs mentioned were:

Cafeteria aides
Custodian helpers
Laundry workers
Mail distributors
Office messengers

---

[1] Not available.

[2] 6 maximum in custodial positions.

[3] 5 in custodial positions.

[4] 5 in custodial positions.

B. Location of job stations

It is clear that all the urban school districts involved in this study met with compliance regarding paragraph 4 of Part C of Section 13 of Public Law 88-210, that employment of students be in the local educational agency or for some other public agency or institution (Federal, State or local).

New York City

All but 4 percent of the business education students worked for the school-community.

Rochester and Schenectady

All vocational work-study students were placed on jobs, in various capacities, within the school-community.

Syracuse, Yonkers

Nearly all participating students in 1965-1966 work-study program were placed in school situations; however, some did work for city governmental agencies, such as City Health Department and public libraries.

C. Salary Range

The rate of $1.25 per hour was paid to all New York State "student-employees" participating in the vocational work-study program.

D. Average Number of Jobs Assigned per Student, 1965-1966

New York City	Rochester	Schenectady	Syracuse	Yonkers
1	1	1	1	1

E. Average Duration of Assignments

Each city's response was that a student, once placed at a particular work-station, was to remain there until the program came to a formal close at the end of the academic year.

IV. Scheduling

All five cities utilize the same general plan for scheduling students' academic responsibilities and work programs: A.M. in school; P.M. at work. Yet each program, with the exception of Yonkers, is flexible in that students are allowed to work in the mornings before school and, in some cases, during students' free-periods.

B. Hours per Week for Counseling[1]

New York City

If counseling services are needed and extended, they are done so on an individual basis by a guidance counselor.

Rochester, Schenectady,
Syracuse and Yonkers

In addition to the benefits a student would receive typically from qualified counseling personnel, a work-study student also receives guidance from the coordinator or consultant in charge of the work-study program as well as his work-station supervisor.

Yonkers couples the above services with two special group-counseling sessions headed by the director of vocational education and his assistant.

---

[1]The impetus for asking this question stems from two statements recorded in a pamphlet issued by the Division of Special Occupational Services.

Topic 6. Suggested Development

c. . . . One major role of the supervisor is to help the student develop and maintain a responsible attitude toward his studies and the performance of his job. Counseling should be a major responsibility of the supervisor.

d. Adequate coordination and counseling time should be allotted to the supervisor in order to have the Work-Study Program operated effectively. Youth Work-Study Program, p. 3.

Schenectady has a counseling program similar to that which exists in Yonkers, only the students meet collectively three times during the course of the academic year.

C. 1. Who determines the academic subjects taken by students?

All cities reported the same: the guidance counselors.

2. Who correlates vocational subjects with the work-experience phase of the program?

New York City

In vocational high schools, correlations of vocational subjects with the work-phase of the program is performed by the school work-study supervisor.

In academic high schools, this responsibility is assumed by the school work-study supervisor and the guidance counselor.

In the junior high schools, this task is assumed by the teachers in charge of the career guidance program.

Rochester, Schenectady,
Syracuse and Yonkers

In the main, this task is primarily that of the consultant or coordinator or the director of vocational education in charge of the work-study program. However, in some situations, other school personnel members, such as the guidance counselor or departmental chairman, may be involved in planning a student's school program.

3. Evaluation of on-the-job experience performed by whom?

New York City

1. The work-station supervisor

2. The school work-study supervisor.

Rochester, Schenectady,
Syracuse and Yonkers

1. The work-station supervisor

2. The consultant, or coordinator of the work-study program.

4. Programs of Vocational Education are to be geared to labor market needs, both immediate and future. Who is responsible for this type of reporting?

New York City

Principals of vocational high schools.

Rochester and Syracuse

The Director of Vocational Education.

Schenectady

The Vocational Advisory Board.

Yonkers

1. The Director of Vocational Education.

2. Advisory Board of Vocational and Extension Education.

5. a. Is there any coordination of the counseling services offered by the schools and the local employment service agency?

New York City, Rochester, Schenectady and Syracuse gave the same answer, Yes; Yonkers, No.

b. If so, who is responsible for this coordination?

The response from the participating cities was the New York State Employment Counselor and school guidance counselor.

Evaluation of Student

a. by supervisor of student worker at work:

New York City

Weekly--Orally

Rochester

Daily--Orally

In written form, the student is evaluated three times during the course of the academic year.

Schenectady

Daily--Orally
Written reports are made out weekly

Syracuse

Daily--Orally
In written form, once at the close of the academic year

Yonkers

Daily--Orally
In written form, once a month.

b. by student's vocational teacher:

New York City

Quarterly--Written

Rochester, Syracuse

As needed

Schenectady

In most cases, the students' work-station supervisors are also the students' vocational teachers. In situations where this is not true, the vocational teachers evaluate students once a month.

Yonkers

Not applicable.

c. by Program Coordinator:

New York City

Not done at all. As explained, the one coordinator of the vocational work-study program is completely occupied with maintaining accurate payroll ledgers for the 101 participating schools.

Rochester

Every other week

Schenectady

Once every two months

Yonkers

Once monthly.

Student History Form, Section A[1]

The following data summaries represent, in tabular form, for the five urban areas, the patterns of responses to the SHF, Section A given by participating seniors in the Vocational Work-Study Program for the academic year 1965-1966.

Of the 1,049, June, 1966 graduates of the Vocational Work-Study Program, 246 graduates were chosen for inclusion in this study. Although 154 questionnaires were returned to this investigator, only 127 had been completed by the graduates of the program. Twenty-seven were returned either by postal authorities due to insufficient addresses and/or addressees unknown (17) or by the graduates' parents or siblings (9). One graduate stated that he chose not to participate in this study.

Yet, as this study is concerned with the work-history of the graduates of the Work-Study Program, 37 returned questionnaires could not be utilized for testing the hypotheses as they were returned by graduate(s) who currently:

---

[1]See Appendix L for raw data.

1. hold a military status (4),
2. are college students (24),
3. are enrolled in business or secretarial school,
4. is enrolled in nursing school (1),
5. is registered in a technical school (1),
6. returned for a post-graduate course in high school (1),
7. are housewives (3).

TABLE 3

ANALYSIS OF STUDENT RESPONSE TO SHF, SECTION A

Results of Hypotheses

$H_{1,2,3,4}$: The proportion of Work-Study Administrators and Supervisors to the number of students in the occupational program will show a positive relationship to job success factors for the seven month period following graduation (see Table 4).

TABLE 4[a]

NUMBER OF WORK-STUDY ADMINISTRATORS AND SUPERVISORS AND STUDENTS, PERCENTAGE, AND RANK OF CITIES ACCORDING TO PERCENTAGE

	Administrators and Supervisors (In Raw Numbers)	Students (In Raw Numbers	Percent	Rank
New York City	649	2,950	22	4
Rochester	440	1,115	40	1
Schenectady	49	152	32	2
Syracuse	108	468	24	3
Yonkers	29	406	07	5

[a]Cities are listed alphabetically.

For hypotheses 1-4, the Kendall-Tau rank correlation method was used. For both hypotheses 1 and 2, the proportion of Work-Study Administrators and Supervisors to the number of students in the occupational program is

related to: 1) the D.O.T. level of graduates' jobs and 2) the proportion of students' available time actually employed after graduation. The degree of correspondence recorded for hypotheses 1 and 2 is -.2.

For H_3, a low, but positive relationship of .2 existed between the proportion of Work-Study Administrators and Supervisors to the number of students in the occupational program and the students' actual job held upon graduation and students' actual job potential.

A zero relationship is established between the proportion of Work-Study Administrators and Supervisors to the number of students in the occupational program and job salaries of program graduates. The rankings of the five cities according to D.O.T. level of students, percentage of time employed, actual job versus job potential and hourly wages of students are listed in Table 5.

Table 6 provides the reader with a listing of the five cities according to the proportion of Work-Study Administrators and Supervisors to the number of students in the occupational program and also graphically charts each city's position in light of other variables.

TABLE 5[a]

RANK OF CITIES ACCORDING TO D.O.T., PERCENTAGE OF TIME EMPLOYED, ACTUAL JOB VS. JOB POTENTIAL, HOURLY WAGE OF STUDENTS

	D.O.T. Level of Students		Percentage of Time Employed		Actual Job vs. Job Potential		Hourly Wage of Students	
	$\bar{X}$	Rank	$\bar{X}$	Rank	$\bar{X}$	Rank	$\bar{X}$	Rank
New York City	26.97	5	79.50	4	.64	5	1.73	4
Rochester	24.05	3	87.75	3	-.09	3	2.09	1
Schenectady	25.00	4	75.31	5	.93	1	1.71	5
Syracuse	22.75	2	97.17	1	.33	4	1.82	3
Yonkers	22.55	1	89.55	2	-.73	2	1.89	2

[a]Cities are listed alphabetically.

TABLE 6

PROPORTION OF WORK-STUDY ADMINISTRATORS AND SUPERVISORS IN RELATION TO D.O.T., SALARY, PERCENTAGE OF TIME EMPLOYED, AND JOB POTENTIAL VS. ACTUAL JOB

	Rochester	Schenectady	Syracuse	New York City	Yonkers
Proportion of Work-Study Administrators & Supervisors	1	2	3	4	5
D.O.T.	3	4	2	5	1
Salary	1	5	3	4	2
Percentage of Time Employed	3	5	1	4	2
Job Potential vs. Actual Job	3	1	4	5	2

$$\tau = \frac{P - Q}{1/2(n)(n-1)} \qquad n = 5$$

	Variable			
	D.O.T.	Percentage of Time Employed	Potential vs. Actual	Salary
P	4	4	6	5
Q	6	6	4	5
τ	-.2	-.2	-.2	0

No significant trends could be noted by the Kendall-Tau correlation rank technique toward increase in the proportion of Work-Study Administrators and Supervisors to students with regard to the D.O.T. level of graduates' jobs, the proportion of time students were employed, the students' actual job held and students' job potential, and the job salaries of program graduates.

Due to the lack of pertinent information in the students' cumulative records, or students' unemployment, or students' omission of essential information on the Student History Form (Section A), the number of observations for each variable included in $H_{5,6,7,8}$ varied.

The Pearson product moment correlation technique is used to measure the intensity of correspondence between the students' grade point averages and:

1. the D.O.T. classification of graduates' jobs;
2. the proportion of students' time actually employed after graduation;
3. the difference between the actual job held after graduation and students' actual job potential;
4. job salaries of program graduates.

The number of observations and the results of the analysis between the students' grade point averages and D.O.T. classification of graduates' jobs are presented in Table 7. The coefficient of correlation equaled .19.

TABLE 7

ANALYSIS OF GRADUATES' GRADE POINT AVERAGES IN RELATION TO D.O.T.

X = D.O.T.	Y = Grade Point Average
$t_{(n-2)} = \frac{r}{\sqrt{1 - r^2}} (\sqrt{n-2})$	N = 89
	ΣX = 2204.0000
t = 1.77	ΣX^2 = 55830.0000
	ΣY = 6943.0000
	ΣY^2 = 544667.0000
	ΣXY = 171566.0000
	$\bar{X}$ = 24.7640
	$\bar{Y}$ = 78.0112
COEFFICIENT OF DETERMINATION	= .0362
COEFFICIENT OF CORRELATION	= .1903

The relationship of grade point average and proportion of students' time actually employed after graduation provides a correlation that is a positive, yet not statistically significant .16. The sample size and results are contained in Table 8.

TABLE 8

RELATIONSHIP OF GRADUATES' GRADE POINT AVERAGES AND PROPORTION OF TIME EMPLOYED

X = Percentage of Time Employed	Y = Grade Point Average
	N = 90
$t_{(n-2)} = \frac{r}{\sqrt{1-r^2}}(\sqrt{n-2})$	ΣX = 7376.0000
	ΣX^2 = 698456.0000
	ΣY = 7018.0000
t= 1.58	ΣY^2 = 550432.0000
p< .10	ΣXY = 578067.0000
	$\bar{X}$ = 81.9555
	$\bar{Y}$ = 77.9777
COEFFICIENT OF DETERMINATION	= .02817
COEFFICIENT OF CORRELATION	= .1678

The degree of relationship between the students' grade point averages and the difference between the actual job held after graduation and students' actual job potential is not statistically significant: the coefficient of correlation was .08. The number of observations and the results are presented in Table 9.

TABLE 9

RELATIONSHIP OF GRADUATES' GRADE POINT AVERAGES AND JOB POTENTIAL VS. ACTUAL JOB

X = Grade Point Average	Y	= Job Potential vs. Actual Job
$t_{(n-2)} = \frac{r}{\sqrt{1-r^2}}(\sqrt{n-2})$	N	= 77
	ΣX	= 5990.0000
	ΣX^2	= 468558.0000
t = .69	ΣY	= 541.0000
p < .25	ΣY^2	= 4195.0000
	ΣXY	= 42003.0000
	$\bar{X}$	= 77.7922
	$\bar{Y}$	= 7.0259
COEFFICIENT OF DETERMINATION		= .00670
COEFFICIENT OF CORRELATION		= .0818

The following analysis was based upon students' grade point averages and job salaries. The mark of relationship between the variables is considered not statistically significant as the degree of correspondence was .08. The sample size and the results are contained in Table 10.

TABLE 10

RELATIONSHIP OF GRADUATES' GRADE POINT AVERAGES AND JOB SALARIES

X = Grade Point Average	Y	= Salary
	N	= 87
$t_{(n-2)} = \frac{r}{\sqrt{1 - r^2}} (\sqrt{n - 2})$	ΣX	= 16092.0000
	ΣX^2	= 3115176.0000
t = .80	ΣY	= 6809.0000
p < .25	ΣY^2	= 535977.0000
	ΣXY	= 1261221.0000
	$\bar{X}$	= 184.9655
	$\bar{Y}$	= 78.2643
COEFFICIENT OF DETERMINATION		= .00751
COEFFICIENT OF CORRELATION		= .0867

No trends could be noted by correlation toward increase in D.O.T. classification, the proportion of students' time actually employed after graduation, the difference between the actual job held after graduation and students' actual job potential, and students' job salaries as students' grade point averages increase.

The number of hours of student counseling is used as a basis in formulating $H_{9,10,11,12}$. The Pearson product moment correlation method is repeated. A

discrepancy exists between the reported usable student forms and the stated size of the sample for each of the variables included in $H_{9,10,11,12}$. This dissimilarity in reporting is due to the lack of information in the students' cumulative folders or to the students' non-admission of data.

H_9: The number of hours of counseling will show a positive relationship to the D.O.T. classification of graduates' jobs.

The coefficient of correlation equals .0997. The number of responses and the results are presented in Table 11.

TABLE 11

RELATIONSHIP OF NUMBER OF HOURS OF COUNSELING TO D. O. T.

X = D.O.T.	Y = Number of Hours of Counseling
$t_{(n-2)} = \frac{r}{\sqrt{1 - r^2}} (\sqrt{n - 2})$	N = 88.0000
	ΣX = 2179.0000
	ΣX^2 = 55185.0000
t = .93	ΣY = 347.0000
$p < .20$	ΣY^2 = 6359.0000
	ΣXY = 8345.0000
	$\overline{X}$ = 24.7613
	$\overline{Y}$ = 3.9431
Coefficient of Determination =	.00995
Coefficient of Correlation =	.0997

H_{1o}: The number of hours of counseling will be related to the proportion of student time employed after graduation.

The coefficient of correlation recorded is -.48665. The size of the sample and the results are presented in Table 12.

TABLE 12

RELATIONSHIP OF NUMBER OF HOURS OF COUNSELING TO PERCENTAGE OF TIME EMPLOYED

X = Percentage of Time Employed	Y = Number of Hours Counseled
$t_{(n-2)} = \frac{r}{\sqrt{1 - r^2}} (\sqrt{n - 2})$	N = 89.0000
	ΣX = 7576.0000
	ΣX^2 = 698456.0000
t = .45	ΣY = 327.0000
p < .35	ΣY^2 = 5701.0000
	ΣXY = 27080.0000
	$\bar{X}$ = 85.1235
	$\bar{Y}$ = 3.6741
Coefficient of Determination =	.002367
Coefficient of Correlation =	.04866

H_{11}: The number of hours of counseling will show a positive relationship to the difference between the students' actual job held after graduation and students' actual job potential.

The degree of relationship between the two variables equals .123296. The number of observations and the results are presented in Table 13.

TABLE 13

RELATIONSHIP OF NUMBER OF HOURS OF COUNSELING TO JOB POTENTIAL VERSUS ACTUAL JOB

X = Number of Hours Counseled	Y = Job Potential Versus Actual Job
$t_{(n-2)} = \frac{r}{\sqrt{1 - r^2}} (\sqrt{n - 2})$	N = 75.0000
t = 1.05	ΣX = 336.0000
	ΣX^2 = 6236.0000
p < .15	ΣY = 522.0000
	ΣY^2 = 4038.0000
	ΣXY = 2168.0000
	$\overline{X}$ = 4.4800
	$\overline{Y}$ = 6.9600
Coefficient of Determination	= .0152
Coefficient of Correlation	= .1232

H_{12}: The number of hours of counseling will show a positive relationship to the job salaries of program graduates.

The coefficient of correlation is equal to .1643. The sample size and the results are charted on Table 14.

TABLE 14

RELATIONSHIP OF NUMBER OF HOURS OF COUNSELING TO JOB SALARIES

X = Salary	Y = Number of Hours Counseled
$t_{(n-2)} = \frac{r}{\sqrt{1 - r^2}} (\sqrt{n - 2})$	N = 90
	ΣX = 16290.0000
t = 1.56	ΣX^2 = 3122408.0000
	ΣY = 344.0000
p < .10	ΣY^2 = 6262.0000
	ΣXY = 67084.0000
	$\bar{X}$ = 181.0000
	$\bar{Y}$ = 3.8222
Coefficient of Determination	= .0270
Coefficient of Correlation	= .1643

No significant trends could be noted by correlation when the number of counseling hours is related to each of the four variables mentioned (D.O.T., salary, job potential, employment).

H_{13}: The administrators' salaries will show
H_{14}: a positive relationship to job success
H_{15}: factors for the seven-month period
H_{16}: following graduation.

Each city has been ranked according to the reported ten-month administrator's salary. The information is presented in Table 15.

TABLE 15[a]

TEN-MONTH SALARY OF WORK-STUDY ADMINISTRATORS

City	Salary	Rank According to Salary
New York City	$16,170	1
Rochester	11,650	2
Schenectady	10,810	5
Syracuse	11,050	3
Yonkers	11,000	4

[a]Cities are listed alphabetically.

Table 16 is a diagrammatic ranking of each variable: 1) the D.O.T. classification of graduates' jobs; 2) the proportion of students' time employed after graduation; 3) the difference between the actual job held after graduation and students' actual job potential; 4) salaries of program graduates, when correlated with the administrators' salaries. The degree of correspondence between the variables is noted.

TABLE 16

RANK OF CITIES ACCORDING TO D.O.T., PERCENTAGE OF TIME EMPLOYED, JOB POTENTIAL VERSUS ACTUAL JOB, AND GRADUATES' SALARIES CORRELATED WITH ADMINISTRATORS' SALARIES

	New York City	Rochester	Syracuse	Yonkers	Schenectady
Administrators' Salaries	1	2	3	4	5
D.O.T. Classification	5	3	2	1	4
Percentage of Time Employed	4	3	1	2	5
Job Potential vs. Actual Job	5	3	4	2	1
Salary of Program Graduates	4	1	3	2	5

$$\tau = \frac{P - Q}{1/2(n)(n - 1)} \qquad n = 5$$

Variable

	D.O.T. Classification	Percentage of Time Employed	Job Potential vs. Actual Job	Salary of Program Graduates
P	3	5	1	6
Q	7	5	9	4
τ	- .4	.0	- .8	- .2

No significant trends could be noted by correlation toward increase or decrease with each of the variables as the administrators' salaries increased.

Assignment of students to Work-Study job stations related to their major field was used as the basis for the final group of hypotheses. The point-biserial technique was used.

Low and not statistically significant correlations are noted for each of the variables.

> H_{17}: The students' D.O.T. classification did not appear to be strongly influenced by the assignment of students to work-study job stations related to their major field.

For this hypothesis a positive correlation of .1557 exists. Forty-nine students' job stations were related to their major field of study; thirty-eight students' job stations were not related to their major field of study.

The results of the above analysis are presented in Table 17.

TABLE 17

$$t_{(n-2)} = \frac{r}{\sqrt{1 - r^2}} \quad (\sqrt{n - 2})$$

$t = 1.98$

$p < .05$

H_{19}: When job stations are related to major fields, the discrepancy between students' potential and actual job level decreases.

The intensity of correlation equaled .0524.

The numbers of observations recorded were: 1) 45 who had been placed in job stations related to their major field of study; and 2) 28 who had not been placed in work situations where they could utilize the skills they were learning. The smallness of the latter group was due to the lack of information necessary to determine each student's job potential.

The results of this analysis are contained in Table 19.

No significant trends could be noted by correlation between students working in related work-study job stations and their 1) D.O.T. classification, 2) the discrepancy between the students' job potential and actual job level, and 3) the graduates' salaries.

CHAPTER V

SUMMARY, DISCUSSION AND CONCLUSIONS

> Right now I am unemployed. I go around looking for a job but I can't find one. I went back to the high school I graduated from they sent me to . . . Placement Center . . . But I still don't have a job.[1]

Summary and Discussion

The clear and calloused fact that greater numbers of our youth will be attempting to carve their niche in the labor market without a proper occupational high school education has caused great concern among government officials, educators and business leaders.

> It is projected that 9,000,000 youths--1 of every 4 reaching age 18--will lack a high-school education when they enter the job market over the next years. With the number of unskilled jobs dwindling, labor specialists foresee the build-up of a large corps of unemployables unless action is taken now to reduce the number of drop-outs.[2]

The Federal government took action to attempt to solve this social pathological condition by approving and

[1] Statement written by a June, 1966 graduate of a Vocational Work-Study Program in one of the five New York State city school districts included in this study. (Student History Form, Sec. A.)

[2] Mark Arnold, "Private Industry Expands Its Efforts to Keep Likely Drop-Outs in School," The National Observer (March 8, 1965).

enacting into legislation the Vocational Education Act of 1963, P.L. 88-210.

P.L. 88-210, as signed by President Johnson, appropriates $60 million for the fiscal year ending June 30, 1964, $118.5 million for the fiscal year ending June 30, 1965, $177.5 million for the fiscal year ending June 30, 1966, and $225 million for the fiscal year ending June 30, 1967 and each fiscal year thereafter.[1]

The rationale behind the Law can be summarized as the creation, upgrading, and addition of school offerings to persons between 15 and 21 years of age, both in and out of school. The Law was designed to extend part-time employment to high school students who are in need of earnings to "commence, continue, or return to," an approved vocational education program on a full-time basis.

A review of the literature reveals that there are no projects in which the relative merits of the Vocational Work-Study Programs operating under P.L. 88-210 were studied for evaluative purposes and that no such research

---

[1] Vocational Education Act of 1963, Part A, Sec. 2, p. 1.

is currently being funded by the U.S. Office of Education.

The work experience program can be a real school and community service. In addition to providing opportunities and benefits for students, it makes for a more effective school program. Also, it has values for employers as well as for the general community.

Yet, while theoretical statements declare the distinct advantages of work-experience programs, Horace A. Oliver[1] reports that these types of programs ". . . don't work. Specifically, the students don's work." He writes that students are involved with the wrong types of jobs, and as a direct result, they can't find work.

The primary purpose of this study was to identify aspects found in the Vocational Work-Study Programs in five New York State city school districts: New York City; Rochester; Schenectady; Syracuse; and Yonkers, that seem to be most closely related to graduates' job success. Thus, it was necessary to identify job success factors to be used as criteria in determining which graduates had

---

[1]"Des Moines, Iowa: Industry Trains--and Hires--Vocational Students," School Management, VIII (May, 1964), 134.

been the most occupationally successful.

Five variables relating to the work-study programs were surveyed:

1. The proportion of Work-Study Administrators and Supervisors to the number of students in the occupational program;
2. The students' grade point averages;
3. The number of hours of counseling;
4. The administrators' salaries;
5. Assignment of students to Work-Study job stations related to students' major field.

These variables were related to four job success factors:

1. The D.O.T. classification of graduates' jobs;
2. The proportion of students' available time actually employed after graduation;
3. The students' actual job held upon graduation and the students' actual job potential;
4. The job salaries of program graduates.

An attempt was made to determine whether the programs having higher ratings on the five variables listed above placed the graduates in correspondingly better job situations. Twenty hypotheses were constructed for the study.

As no formal instruments had been constructed previously to identify strengths and/or weaknesses of Vocational Work-Study Programs operating under The Vocational Education Act of 1963, three questionnaires were designed and utilized to serve as the basis for investigating significant job success factors:

1. Program Descriptive Factor Sheet (Appendix I)
2. Student History Form, Section A (Appendix F)
3. Student History Form, Section B (Appendix G).

Although, in the main, no statistically significant trends were indicated, two hypotheses were found to be significant at the .05 level of confidence.

1. H_5: The students' grade point averages will have a positive relationship to the D.O.T. classification of graduates' jobs.

The Pearson Product Moment correlation technique was used. The results are summarized in Table 7.[1] This finding supports Channing's[2] earlier report that in-school achievement is related to on-the-job success.

2. H_{17}: Assignment of students to Work-Study job stations related to students' major field

---

[1]See Chapter IV, p.

[2]Channing, op. cit.

will be related to the proportion of students' time employed after graduation.

The Point-Biserial technique was utilized. The results are contained in Table 18, page 145.

The first four hypotheses stated that the proportion of Work-Study Administrators and Supervisors to the number of students would show a positive relationship to:

1. The D.O.T. classification of graduates' jobs;
2. The proportion of students' available time actually employed after graduation;
3. The students' actual job held upon graduation and students' actual job potential;
4. The job salaries of program graduates.

The results of the present study did not support these hypotheses. Rochester, the city which was ranked highest in terms of Work-Study personnel to the number of Work-Study students, was ranked third when comparing the D.O.T. levels of graduates' jobs for the five cities, third highest for the percentage of students' time employed since graduation, and again third for students' actual job versus job potential. Rochester did rank

highest when considering the hourly wage of program graduates--$2.09. Yet it would be somewhat mendacious to honor a direct "cause and effect" relationship between the proportion of Work-Study Administrators and Supervisors to students and students' hourly wage. Rochester's relatively high general economy is an obvious factor which must be considered.

Unfortunately, it was not possible to obtain from four cities the number of Work-Study Administrators and Supervisors who worked exclusviely with seniors.

Eighty of the 127 study participants either strongly or mildly agreed that the Work-Study program could be improved. Sixty-five graduates chose to explain what ameliatory changes should be made; 18 responses (27 percent) suggested that greater supervision of students' work was in order.[1]

The rationale for constructing the second hypothesis was based upon the declared purpose of P.L. 88-210.

> It is the purpose . . . to assist them [States] to maintain, extend, and improve

---

[1]See Appendix L, Table 36, for complete account of graduates' attitude of how the Work-Study Program could be improved.

> existing programs of vocational education, to develop new programs of vocational education, and to provide part-time employment for youths who need the earnings . . . to continue their vocational training. . . .[1]

It was assumed by the investigator that by continuing, and/or upgrading and/or adding curricula, which were designed with student needs and abilities in mind, that the students' academic performance and attitudes toward school would be improved appreciably, which in turn would influence their post-school careers.

Assuming the graduates' recall was accurate and relatively objective and assuming an "either--or" type of response is all that is necessary for discussion purposes, then 72 percent of the recorded graduates' responses indicated that they did "better" in their school work while participating in the Work-Study Program; 24 percent indicated that the Work-Study Program did not improve their school grades and 4 percent of the sample chose to ignore the question.[2]

Disregarding the 4 percent who did not respond to the question, the complexion of the over-all pattern changes appreciably if both ends of the continuum are

---

[1] Vocational Education Act of 1963, p. 1.

[2] See Appendix L, Table 33, for complete account of graduates' responses.

weighed individually, strongly agree--strongly disagree, and both moderate-type responses--mildly agree and mildly disagree are grouped together. The responses would then read--27 percent, strongly agree; 9 percent, strongly disagree; and 60 percent; irresolute or mildly agree and mildly disagree.

While constructing the attitudinal section of the questionnaire,[1] it was decided to force the subjects to respond in an "either--or" pattern. Possibly, allowance for "No Change" should have been taken into account.

With reference to Question 15,[2] would that percentage, if any, of those who underscored mildly agree--mildly disagree, have recorded, "No Change," had the neutral choice existed?

As previously stated, the students' grade point averages did show a statistically significant relationship when correlated with the graduates' D.O.T. job classification level at the .05 level of confidence.

The remaining correlations for hypotheses 2, 6, 7, and 8 concerning grade point average when correlated

---

[1]See Appendix F, Student History Form, Section A, Questions 12-17.

[2]"I did better in my school work while in the Work-Study Program."

with 1) the proportion of students' time actually employed after graduation, 2) the difference between the actual job held after graduation and students' actual job potential, and 3) job salaries of program graduates, even though not statistically significant, are positive. Hence, the general tendency suggested is that students' school achievement may influence the job success factors identified for this study.

Regarding hypotheses 9, 10, 11 and 12, notwithstanding the low degrees of relationship between the number of hours of counseling and the four job success factors, all correlations were positive. The implication here suggests that through proper guidance and counseling comes the opportunity for job success.

> Each student under this program shall be assigned to a school work-study supervisor or counselor. . . . Counseling should be a major responsibility of the supervisor.[1]

Yonkers and Schenectady were the only two cities which reported special group-counseling sessions for all vocational Work-Study students in addition to the pupil personnel services which are typically offered.

---

[1] Youth Work-Study Program, p. 3.

Of the total sample, 59 percent responded that they never spoke to their administrator of job station supervisor concerning problems related to their jobs: 39 percent of the responses indicated a need on the part of the students to speak with their supervisor at one time or another. Two percent of the population chose not to respond to the question.[1]

Students who may have had difficulties in their job placements, may have chosen to discuss them with other school personnel members.

Although the Vocational Work-Study administrator or job station supervisor need not assume the role of a job-placement officer, it is this investigator's opinion that firmer lines of communication concerning senior students, who will soon be available to the working world marketplace, be established between the program's personnel and the school's guidance staff and/or the local public employment agency. As a case in point, 31 percent of the graduates in this study's sample population who were actively seeking employment, did not have jobs as of June, 1966.

---

[1]See Appendix L, Table 37, for complete account of graduates' responses to "How many times did you speak to your administrator or job supervisor to talk about problems on your job(s)?"

Twelve percent of 31 percent, who were not placed in jobs upon graduation, found positions within a month. Yet 10 percent of the sample sought employment for over 90 days; one student reported she has never been employed.[1]

Even though specific reasons were not discernible from the existing raw data, it is gratifying to be able to report that 94 percent of the total sample population liked the Vocational Work-Study Program.

Regarding hypotheses 13 through 16, both low positive and low inverse relationships, in no case statistically significant, resulted when measuring the degree of correspondence between the Administrator's salaries and the four job success factors. The only statement which may be reported with certainty is the larger the program, the greater the administrator's salary.

Hypotheses 17 through 20 stated that assignment of students to Work-Study job stations related to their major field would show a positive relationship to the four job success factors identified.

---

[1]See Appendix L, Table 43, for graduates' responses to "How long after graduation, June, 1966 did it take you to get your first job?" p. .

> . . . and the acid test of the quality of the vocational program is placement of graduates in the occupations for which they received instruction.[1]

In reviewing the literature pertaining to vocational or occupational education for students representing various ability levels, the investigator noted various researchers' mention of the importance and value of job-related stations.

For example, Venn reports that the intention of Congress in drafting P.L. 88-210, was "to foster flexibility, adaptibility, and experimentation in a vocational education effort geared to technological change."[2] To wit, vocational agricultural funds may be utilized for training in "agricultural related occupations, without the traditional farm practice requirement."[3]

Ivins and Runge[4] state that some of the most valuable vocational training may be provided on a payroll job when it is coupled with guidance of the work and associated related instruction.

In a study sponsored jointly by the U.S. Office

---

[1] Eninger, op. cit., Foreword.

[2] Venn, op. cit., p. 125.

[3] Ibid.

[4] Ivins and Runge, op. cit., p. 231.

of Education, the U.S. Office of Vocational Rehabilitation and the Project on Technical Planning of the American Association on Mental Deficiency, it was reported that:

> A Work-Study Program can be an important appendage of carefully planned school experiences designed to develop attitudes and behaviors relevant to vocational adjustment.[1]

Prosser and Quigley write "Efficient vocational education for any employment can be given successfully only to those who are being prepared for such employment. . . ."[2]

> Job placement should utilize the student's abilities and interests for vocational education goals to the greatest extent possible.[3]

Three of the correlations did show a positive relationship between the assignment of students to job stations related to their major field and:

1. The D.O.T. classification of graduates' jobs;
2. The proportion of students' time employed after graduation;
3. The difference between students' actual job held after graduation and students' actual job potential.

Yet it was disconcerting when analyzing the raw

---

[2] Prosser and Quigley, op. cit., pp. 10-11.

[3] Youth Work-Study Program, p. 3.

data to find that:

1. 51 percent of students in the total sample were placed in job stations not related to indicated major field;

2. Only 62 percent of those students who are currently employed are utilizing skills related to the occupations for which they received instruction;

3. 52 percent of those post-school jobs listed by graduates were not remotely related to job stations held in school.

Students' comments, such as the following, indicated an exigency for program change.

> In my case I was given a job of sweeping floors and washing walls and windows when I thought I'd be working with office machines and improving my field but as you see I'm not working in what I studied in school.
>
> I think a person in the Work-Study Program should be working in what he has been studying. . .
>
> In my case--the work I was doing had no relation to the course I was taking in high school.[1]

What percentage, if any, of those graduates who are now employed in job situations which are not related to the occupations for which they received instruction, were subject to poor work-study job stations? Syracuse

---

[1] Statements written by June, 1966 graduates of Vocational Work-Study Programs (S.H.F., Sec. A).

and Yonkers were the only two school districts reporting involvement of Federal, State and/or local public agencies, outside of public school situations, when assigning students to job stations. There was an obvious attempt to place students in job situations which were related to their vocational program. Interestingly, both these cities rank highest of proportion of students' time employed after graduation. (Syracuse ranked highest; Yonkers, second.)

In constructing the outline of this study, it was assumed that while the Work-Study Administrators and Supervisors were certified for their positions; they may not have been necessarily qualified by training and experience to teach students their jobs.

Such criticism was reported by the Director of Vocational Education in Schenectady to this investigator. He felt those students who were placed with the custodial staff, for instance, were gleaning little. Hence, from October, 1965, no Vocational Work-Study Program students were assigned to those school personnel members holding custodial positions.

Although the survey instruments utilized in this study did not ostensibly allow for graduates' expressions of attitudes toward their work-stations,[1] per se, and while it may be true in several instances that students may have preferred the type of work required of them on tasks unrelated to their vocational programs, why were only 21 percent of the male population placed in work-situations bearing semblance to the vocational programs in which they were scheduled? This, as opposed to the nearly 70 percent of the female population who were placed in work situations complimenting and extending their vocational programs (see Table 21, p. 166). Where parallelism existed between the bi-faceted program, comments as indicated below, were typical.

> If it weren't for . . . of . . . , who got me into the work-study program, I feel that I wouldn't have had the necessary experience that I needed when I entered my job with. . . . I think the work-study program plays a great part in the student's future. You should be proud of it.

Eninger states that the matter of choosing a vocation is usually not an easy task.

> . . . the choice is based upon a combination of little real knowledge of the chosen vocation,

much misinformation and high hopes, and pressures from parents, relatives and others interested in influencing the choice.[1]

He goes on to say that a student who realizes that the trade

> . . . he has selected is not what he is suited for, whether for reasons of ability or interest, is under considerable pressure to continue in the course selected. Schools tend to discourage switching from one course to another. Many parents are inclined to do the same. Even where these pressures are not present, there may be a reluctance to change to another course because change means leaving old classmates, starting all over again, admitting defeat, or other deterrents. For many who realize they have made the wrong choice, there is no solution but to continue in the course chosen until they graduate. After that, they can always go into something else.[2]

---

[1]The Process and Product of T & I High School Level Vocational Education in the United States, chap. 4, p. 1.

[2]Ibid.

Only 62 percent of the 90 youths, eligible for employment, are currently working at jobs for which they received formal high school training: 56 percent of the male graduates are now responsible for performing skills which do not mirror the slightest identification to their vocational programs (see Table 22).

And according to a recent study

> If the graduate's first job is not in the trade studied or a highly related trade, the chances are high that he will never enter the trade or a highly related trade. But, if his

> first job is in the trade or a highly related trade, the odds are great that he will stay with the trade or allied trade. Therein lies the significance of the first full-time job after graduation. The first job . . . is a harbinger of jobs to come.[1]

Conclusions

First of all, it is this investigator's feeling that in actuality the Vocational Work-Study Programs investigated in this study uphold the intent of the Vocational Education Act of 1963.

> DECLARATION OF PURPOSE
>
> Section 1. It is the purpose . . . to develop new programs of vocational education, and to provide part-time employment for youths who need the earnings from such employment to continue their vocational training on a full-time basis, so that persons . . . will . . . benefit from such training.[2]

This conclusion is based on the following:

1. Approximately 76 percent of the sample responded either strongly or mildly agree to:

   The Work-Study Program has helped me since graduation, June, 1966. (See Appendix L, Table 30.)

2. Approximately 79 percent of the sample responded either strongly or mildly agree to:

---

[1] Ibid., chap. 5, p. 1.

[2] Vocational Education Act of 1963, p. 1.

I would tell a friend to go back to school for the Work-Study Program. (See Appendix L, Table 31.)

3. Approximately 94 percent of the sample responded either strongly or mildly agree to:

   I liked the Work-Study Program while in School. (See Appendix L, Table 32.)

4. Approximately 80 percent of the sample responded either strongly or mildly agree to:

   I <u>did</u> <u>better</u> in my school work while in the Work-Study Program. (See Appendix L, Table 33.)

5. Approximately 76 percent of the sample responded either strongly or mildly agree to:

   I <u>enjoyed</u> <u>school</u> more while I was in the Work-Study Program. (See Appendix L, Table 34.)

Of the 90 students who are eligible for employment:

6. Approximately 69 percent of the sample responded that they did have a job when they left school in June, 1966 (see Appendix L, Table 42) and an additional 12 percent of the sample found jobs within 30 days after graduation (see Appendix L, Table 43).

7. Approximately 64 percent of the sample responded that they are working 31-40 hours

per week and approximately an additional 16 percent responded that they work over 40 hours per week (see Appendix L, Table 39).

8. Approximately 82 percent of the sample responded that they are earning more than $1.51 per hour.
   a. Approximately 30 percent earn $1.51-$1.75 per hour.
   b. Approximately 26 percent earn $1.76-$2.00 per hour.
   c. Approximately an additional 26 percent earn more than $2.00 per hour (see Appendix L, Table 40).

Secondly, an area of great importance in the success of graduates of the Vocational Work-Study Program was indicated by data collected in the present study as that of placement of graduates in jobs for which they had received specific training. The findings of this study indicating the relative minor emphasis given to the guidance function of the five Vocational Work-Study Programs investigated are supported by Venn's statements concerning guidance in vocational technical education in general.

He writes that nearly half of the states benefiting from Federal monies for their programs spend less than 1 percent of the monies for occupational guidance and counseling.

> The problem begins in college-oriented high school guidance departments, which too often are staffed by people who have neither the knowledge to help students select an occupation nor the inclination to direct them toward the appropriate vocational or technical education opportunities. It continues once the student arrives in the vocational or technical school; although no other segment of education has recognized the importance of vocational guidance to the extent that these schools have, lack of funds, of reliable testing materials, and of appropriately trained vocational guidance counselors limits what the vocational and technical school is able to do.[1]

In light of the data reported herein concerning the relatively greater success of graduates placed in jobs utilizing skills in which they had received instruction, the following suggestions are made:

1. A greater percentage of the Federal monies should be spent for occupational guidance and counseling.

2. The use of local advisory committees, e.g. that which is proffered in Youth Work-Study Program,[2] should be further encouraged.

---

[1] Venn, op. cit., p. 36.

[2] Youth Work-Study Program, p. 3.

3. There should exist "orientation" sessions, for school work-study supervisors, counselors, vocational and technical instructors, and appropriate officials of the State Education Department, so that program integrity is the result of concerted effort.

4. Specialists, representative of fitting disciplines and vocations should meet periodically to question openly whether the current vocational and technical curricula are equal to the demands of a changing world of work. While it is true that, ". . . schools pride themselves on how close their shop facilities duplicate real job conditions . . ."[1] according to Venn,

> . . . this does not necessarily mean that the school has given the graduate the education he may really need. What is called for is more and better occupational education, to be sure, but occupational education on a more general basis--teaching certain basic skills, of course, but also devoting more time to the development of broader technical understanding of communication and computational abilities, and of an appreciation of civic, cultural, and leisure.[2]

Thirdly, this study's findings seem to point out certain directions for future research.

---

[1] Venn, op. cit., p. 32.

[2] Ibid.

As written in Chapter II, Arnstein stated that the Vocational Education Act of 1963 "should open the door to a new educational orientation which is part of our changing industrial society. . . ."[1]

Yet, has it? Further research pertaining to the efficacy of Vocational Work-Study Programs is in order. Such reports might attempt to seek the answers to such questions as:

1. Are employers more satisfied with those high school students who participated in the Vocational Work-Study Programs as compared to other terminal high school students?
2. Has the "holding power" of those schools offering Vocational Work-Study Programs increased appreciably?
3. Have the skill levels of the Vocational Work-Study Program graduates improved significantly as a direct result of participating in the Vocational Work-Study Program?
4. What strengths and/or weaknesses are discernible in Vocational Work-Study Programs conducted in rural or consolidated school districts as opposed to the urban-operated programs?

---

[1]Arnstein, op. cit., p. 71.

5. What do periodic follow-up studies on participants of the Vocational Work-Study Programs reveal concerning their educational experiences?

Certainly much new thinking must be devoted to vocational and technical pedagogy, a realm visited by very few educators for a great many years. Perhaps the time is here for the educational community (with its over-all experience in matters of teaching and learning) and industry (which has many of the facilities to do the job) to re-examine their long standing apathy. . . .[1]

---

[1]Venn, op. cit., p. 34.

APPENDICES

APPENDIX A

PROFILES OF FIVE VOCATIONAL PROGRAMS

New York City, New York

The Vocational High Schools

The vocational high schools of New York City combine training for earning a living in the skilled trades with general secondary education.

> It aims toward civic, economic, cultural, and physical development. Terminal courses are offered preparing for occupations in the industrial and commercial fields and in the service trades.[1]

The vocational high schools are in session six hours a day. Of this time, 50 percent is devoted to practical shop work in the vocational subjects chosen by the pupil. The balance of the day is devoted to classes in related mathematics, science, and drawing (or other related subjects) and in English, social studies, and health education or music.[2]

Educational Opportunities Offered in the Vocational High Schools of New York City.

Trade Courses. More than seventy separate three-year trade courses are offered in the New York City

---

[1] "The Vocational High Schools," Directory of the Public High School of the City of New York, 1966-1967 (Brooklyn, N.Y.: Board of Education, Bureau of Educational and Vocational Guidance, n.d.), p. 7.

[2] Ibid.

vocational high schools.[1]

Business Courses. Commercial courses in seven different fields are in various vocational high schools. Students majoring in Business spend approximately three hours daily in commercial classes and three hours in regular high school academic classes.

Technical Courses. Eight different three-year technical courses are offered in the vocational schools. These courses of study prepare pupils for jobs as junior engineers, draftsmen, laboratory technicians, and assistant fashion designers in the textile field.

The technical course of study is so designed that three hours of every school-day is spent in laboratories, or shops or drafting rooms, and three hours in academic subjects. The academic subjects include English, social studies, elementary and intermediate algebra, plane geometry, trigonometry, advanced algebra, technical physics, and technical chemistry. Pupils are required to take Regents examinations.

---

[1] Ibid.

Special Courses

The Cooperative Course in Academic and Vocational High Schools. Cooperative education combines the theoretical instruction of the classroom with practical experience in a related job and includes all types of work-study courses.

In the Cooperative Course pupils, 16 years or older, take the same subjects as are given in the regular courses. In addition to fulfilling requirements in English, social studies, art, and music, cooperative pupils may choose from the following electives: accounting, bookkeeping, business machines, clerical trades, design, dressmaking, food trades, machine shop, millinery, needle trades, hospital aide, and plastics.

Jobs are related to school studies, diploma credit is allowed for satisfactory employment, pupils are supervised on their jobs, and prevailing wages are paid. A variety of schedules is offered: alternate-week (AW); alternate-two-week (A2W); alternate six-week (A6W) in practical nursing, terms 7 and 8; and part-time daily (PT).[1]

Vocational Courses for Boys

Architectural Drafting
Automatic Heating Mechanics
Automation (Instrumentation)
Automotive Mechanics
- Auto Body and Fender Repair
- Automotive Machine Work
- Auto Painting
- Collision Body and Fender Work
- Gas Station Operation

Aviation Mechanics
Business Education
- Accounting and Business Practice

Post-High School Study

Special Courses for Recent High School Graduates

One-year, full-time trade or technical programs for recent high school graduates under twenty-one years of age are now available as follows:

Trade Courses:

Automotive High School--Auto Mechanics (Boys (only)

H. S. of Fashion Industries--Pre-employment course in interior design, textile design, fashion merchandising, fur operating and cutting, shoe manufacturing, men's clothing manufacturing, upholstery

Manhattan Vocational-Technical High School--Machine Shop (Boys only)

New York School of Printing--Printing (Boys (only)

Technical Courses (Boys and Girls)

George Westinghouse Vocational & Technical High School

These courses are on a technical level with a large portion of the day devoted to laboratory work.

Computer Technician--laboratory work in computer circuitry, computer mathematics, and training on electronic data processing equipment. This course is open only to graduates of technical electricity or electronics courses.

Computer Programmer--approximately 4 hours a day on practical "on hands" time on the computer and associated electronic data processing equipment, programming theory, computer mathematics, and business accounting. This course is open to graduates of technical or academic high school courses having a three-year sequence in Regents mathematics.

> Radio and TV Studio Technician--Students will spend all day in the television studio. A first-class radio-TV license is required for graduation. This course starts in July and is open to high school graduates of electricity, radio, or electronics courses, or to those having experience as radio amateurs.[1]

Rochester, New York

> We have a good curriculum. Our offerings are comprehensive and diverse. There are offerings that lead to semi-skilled and skilled occupations and to all sorts of post-high school education. These offerings are constantly being reviewed, evaluated, and revised.[2]

In recognition of individual differences, the city of Rochester provides programs for the academically talented, both honor and accelerated classes; the Regents program, the usual course of study for average and above average high school students; the Non-Regents[3] program, designed for students whose school records show they would have extreme difficulty in a Regents program; the School-Work Program, a three-year program for slow-learning students who have been unable to show normal progress

---

[1] Ibid., p. 74.

[2] Herman R. Goldberg, "Message to Students and Parents," Opportunity Unlimited--Rochester, New York (Rochester, N.Y.: Guidance Department, City School District, 1965), p. 6.

[3]

in the elementary schools,[1] and the Occupational Education program for the mentally retarded students who fall within the intelligence range designated by the State Education Department.

Courses at Edison Technical and Industrial High School

The Exploratory Program. The Exploratory Program offered at Edison Technical and Industrial High School has been developed so that the ninth grade pupils are presented with the basic fundamentals of the various trades taught at this high school and to assist pupils in the selection of a shop program best suited to their interests, abilities and needs.

The trades included in this program are drafting; electricity; graphic arts; machine; metal and wood; textile fabrication; and transportation.

The Technical Program. The technical program is designed to provide a student with a thorough foundation in technology. The students who are graduated from this program are qualified for positions as technicians or for college.

---

[1] "The School-Work Program," Opportunity Unlimited--Rochester, New York (Rochester, N.Y.: Guidance Department, City School District, 1965), p. 16.

Four class periods of the eight-period school day are devoted to the study of Regents English, social studies, mathematics, physics, chemistry. Regents achievement is also required in the student's field of interest, such as electrical technology, instrumentation, and mechanical design.[1]

Industrial Courses.

> The industrial program offered at Edison Technical and Industrial High School is designed to prepare a student for employment in a skilled occupation.[2]

Graduates of this program are qualified for not only jobs but continued education either in apprenticeship training programs and specialized school. For second semester senior students with a cumulative C average, there is offered a cooperative work program.

Those students enrolled in an industrial course will spend approximately 50 percent of each school day in shop classes. The remainder of the day entails the study of related mathematics, science, and drawing, in addition to the required subjects in English, social studies,

---

[1] "Courses at Edison Technical and Industrial High School," Opportunity Unlimited--Rochester, New York (Rochester, N.Y.: Guidance Department, City School District, 1965), p. 26.

[2] Ibid.

health instruction, and physical education.[1] A student enrolled in an industrial course may elect Regent subjects.

Industrial courses available are auto mechanics; commercial art; shop drafting; electricity; lithography; machine shop; pattern making and foundry practice; printing; sheet metal; textiles; and welding.

In addition to the above, the vocational education curricula include two other programs--cosmetology and horticulture.

Cosmetology is a two-year program given in the junior and senior years at Jefferson High School. It is made available to both boys and girls. Students enrolled in this program spend three consecutive hours daily in cosmetology and the remainder of the school day in academic classes. Upon successful completion of this program, students are awarded a high school diploma. Those students who pass the state board examinations qualify as licensed beauticians.[2]

The horticulture program offered at Charlotte High School prepares high school students for employment

---

[1] Ibid.

[2] "Vocational Education," Opportunity Unlimited--Rochester, New York (Rochester, N.Y.: Guidance Department, City School District, 1965), p. 60.

in the field of ornamental horticulture in greenhouses, florist shops, nurseries, garden stores, and landscape service companies.[1]

Students may choose to pursue their education at the State Agriculture and Technical Institute.

Cooperative Training Programs.

The Cooperative Training Programs offer a combination of class work and actual job experience.

The Rochester City School District offers five Co-operative Training Programs.

1. The Cooperative Office Practice Program.
2. The Cooperative Retail Program.
3. The Edison Technical Industrial High School Cooperative Work Program.
4. The Cooperative School Work Program.
5. The Occupational Education Program.

Selection of students who wish to participate in a Cooperative Program is made on the basis of high school grades, skills, and personal characteristics.

Co-op students usually start at the beginning pay rate and must work a minimum of fifteen hours per week.[2]

Business Education

Rochester's business education program is threefold in purpose:

1. Contributes toward the general education of students.
2. Provides basic business training for employment upon graduation.

---

[1] Ibid.

[2] "Cooperative Training Programs," Opportunity Unlimited--Rochester, New York (Rochester, N.Y.: Guidance Department, City School District, 1965), p. 30.

3. Offers courses which have personal use and vocational values for students who will be pursuing a college education.[1]

A strong emphasis on favorable personal qualities and work habits, that are necessary for maintaining and advancing on-the-job, is included in all business curricula. An appendage of the business education program, cooperative work-study programs, is offered to qualified business students in office skills and retailing.

The business education program provides opportunities in four major areas: stenographic, bookkeeping, retail, and general clerical.

Special Education Programs

The School-Work Program. The School-Work Program is a three-year program designed for slow-learning students. The importance of general work attitudes and skills is stressed. During the third and final year of the School-Work Program, classroom work is combined with actual on-the-job experience for which they are paid.

The Occupational Education Program. The Occupational Education program is also a three-year program,

---

[1] Ibid.

but is designed for mentally retarded students. The curriculum is work-orientation which culminates in a work-study program for the student's final year.

Schenectady, New York

Schenectady High Schools

The Schenectady Public Schools offer courses for students who wish to prepare for college careers and for students who wish employment upon graduating from their high school programs. While the college-bound student pursues vocational courses in medicine, law, education, engineering, and other professions in the university, the vocational preparation of the non-college student must be given while in high school.

The Vocational Department of the Schenectady Public Schools is concerned, in the main, with the education of high school students who are not college-bound.

> These are the students who after graduation are employed in the offices, stores, trades and manufacturing plants of the city. These are the students who become our skilled employees. The Schenectady Public Schools offer training for vocational competence on both the high school and adult levels.[1]

---

[1] Lester E. Williams, "Preface," Vocational Courses in the Schenectady High Schools (Schenectady: Linton High School Printing Department, n.d.).

As vocational education places emphasis upon skills, one-half of the student's day is spent in the shop or laboratory. The daily program also includes related courses in the mathematics, science and drafting needed by the trained craftsmen in any one occupational field. In addition, the vocational students take English, social studies and physical education along with all other high school pupils.

> The selection of the skilled vocations included is based upon the prevailing occupations of the community and the number of replacements needed yearly in each particular field of employment.[1]

Vocational education courses are offered at Mont Pleasant and Linton High Schools for both boys and girls.

Course Objectives.

College Preparatory Courses.

College preparatory courses are designed to provide the necessary course requirements for college entrance. Basically, sixteen units are needed for a college preparatory diploma. However, eighteen units are preferred in view of increasing college entrance requirements and qualification for New York State Regents diploma. The technical program adds to the college preparatory requirements more mathematics, science and technology thereby providing a challenging high school preparation for the academically talented, science-oriented boy or girl. The college preparatory-business course will qualify a pupil for either admission to a four-year college or full-time employment upon successful graduation from high school.

Business Education Courses.

Business education courses are primarily designed for students who wish to seek employment

immediately upon graduation from high school. However, if the business education student has maintained a good academic average and has chosen elective subjects commensurate with academic ability, he may qualify for entrance into some colleges and business schools. Business education specialty areas include:

1. Secretarial
2. Clerical
3. Distributive Education

Vocational and Cooperative Courses.

Vocational and cooperative courses may or may not prepare the student for college, depending on the choice of elected subjects and academic achievement. The courses should be of interest to those who wish to concentrate on an area of study which fulfills their needs and interests. The specialty areas from which the student may choose include:

1. Industrial Arts
2. Cooperative Industrial
3. Trade Auto Mechanics
4. Trade Aviation
5. Cooperative Practical Nursing
6. Trade Marine & Small Engine
7. Trade Dressmaking
8. Trade Power Sewing
9. Trade Industrial Drafting and Mechanical Drawing
10. Trade Mechanical Drawing
11. Trade Transportation.

Special Education Courses.

Special education courses are designed to help students who require a more individualized approach or more intensive assistance because of their sight, hearing, speech, orthopedic and/or other physical or health limitations. Students may follow regular courses with this assistance to complete requirements for graduation from high

> school and for further study. Special education also helps students with learning disabilities imposed by other types of limitations. The latter program is very flexible and proceeds at a much slower pace with greater emphasis on meeting the interests and needs of students. The specialty areas from which a student may choose include the more general areas such as industrial arts, occupational training, and the ungraded areas of the language arts, and social studies.[1]

Educational Opportunities at Linton High

Linton High School's guidance department's "Courses of Study" gives a panoramic view of the subjects and courses offered.

There appears to be overlap between the courses of study available at the two high schools--Mont Pleasant and Linton.

The courses of study at Linton High are:

College Preparatory
- a. College
- b. College--Business Education
- c. College--Graphic Arts

Business Education
- a. Stenography
- b. Bookkeeping
- c. Office Practice
- d. Business Management

Cooperative Education
- a. Cooperative Industrial Training
- b. Cooperative Practical Nursing
- c. Cooperative Retailing

---

Vocational Education for Boys
- a. Automobile Mechanics
- b. Electricity and Industrial Electronics
- c. Industrial Drafting
- d. Machine Shop
- e. Graphic Arts Education

Vocational Education for Girls
- a. Cosmetology
- b. Dressmaking

General
- Special Class Education

Objective of Courses

The College Preparatory Course is designed to meet the entrance requirements of colleges in general. However, there is considerable variation in the entrance requirements of different colleges. For example, some colleges will admit an applicant without science, while others do not require a language.

The College Preparatory Business Education Course is designed for the student who is able to carry a college preparatory course but who also desires training in the business field. The course offers excellent preparation for business training on a college level.

The College Preparatory Graphic Arts Course is designed with the twofold purpose of giving the student a broad educational background and to equip him to continue his training on either an apprenticeship level or on a collegiate level. Should the student decide to change his educational objective he would still be able to enter college upon completion of the course.

The Business Education Course is designed to give preparation for office and store employment or preparation for advanced business training.

The Cooperative Education Courses provide an opportunity for practical work experience during the senior year.

Vocational Education Courses offer training in preparation for work in the several trades. They should be of special interest to those students who do not plan to enroll in institutions of higher learning after graduation from high school.

The General Course is designed for those students who desire to major in the field of their particular interest. The course may or may not prepare for college, depending upon the subjects taken and the marks achieved.

The Special Class Education Course provides training for the ungraded students.[1]

Cooperative Education Courses.

Cooperative Industrial Training.

There are many industrial types of occupations for which the public schools can offer training. The Cooperative Industrial Training Program is designed to assist those students who are interested in a co-operative work-study plan to obtain training in occupations not afforded in the regular day school programs.

Some of the occupations involved in the program are as follows:

Automobile Parts manager
Automobile service station attendant
Automobile body repairman
Electrical appliance repairman
Furniture upholsterer
Dry cleaner
Baker
Copper-plate printer
Canteen service repairman
Meat cutter
Silk screen specialist
Greenhouse worker

---

[1] and "Objectives of Courses," Courses of Study, 1966-1967, Linton High School (Schenectady, N.Y.: Linton High School Printing Department), p. 3.

The plan offers an opportunity to learn practically any trade in the community, creates opportunity for experience on real jobs under actual working conditions, and provides an experience background for a full-time job.

Students who desire to participate in the program must have a satisfactory school record and must be acceptable to both the teacher-coordinator and the employer. Students spend four periods in school and the remainder of the day with the employer. One of the four periods is spent with the teacher-coordinator in a class on occupational theory. This class covers such topics as getting along with people, succeeding on the job, personal problems, employment objectives, and industrial psychology. Each student is given an outline which covers the technical part of the work which he will encounter on his job.

The teacher-coordinator makes arrangements for placing the student in a suitable training establishment, although some jobs which are secured by the student may be approved. The teacher-coordinator makes periodic inspections of the on-the-job training to insure that a suitable training program is being followed and the individual is making satisfactory adjustments to this program.

The average work week is thirty hours. The student receives a salary while working and two units of high school credit upon the successful completion of the training program. The program is primarily for seniors.[1]

Cooperative Retailing.

The course in Cooperative Retailing is fundamentally designed to train students in actual business situations while they are attending school. Practical experience is obtained in the classroom laboratory and in the Student Store. The cooperative training program, open to both boys and girls, should be elected at the beginning

---

[1] "Cooperative Education Courses," Courses of Study, 1966-1967, Linton High School (Schenectady, N.Y.: Linton High School Printing Department), p. 26.

of the eleventh year. An outline of the course follows:

Retailing I (11th year)

History & Development of Retailing
Principles of Merchandising
Channels of Distribution
Sales and Sales Supporting Activities
Salesmanship & Stockkeeping
Store Policies & Customer Services

During the twelfth year, students in the Distributive Education program attend school for four periods during the day and work in offices and stores for the remainder of the day. The classroom work is planned to assist the student in his work on the job. The following is an outline of the course:

Retailing II (12th year) (Co-op Work Program)

Developing Leadership
Store Organization & Operation
Duties of a Buyer
Retail Mathematics & Stock Control
Sales Promotion
Advertising
Window Display
Fashion Merchandising

Employment is supervised by the teacher-coordinator. The student receives a salary while engaged in this work. He also receives one unit of school credit for his on-the-job employment if satisfactorily completed.

Cooperative Practical Nursing.

The practical nurse is an essential member of the hospital nursing staff. Her services are also needed in the home, in industry, and in the doctor's office.

The excellent laboratory and teaching facilities which are available permit a highly efficient nursing program to be offered. Eligible students must be interested in helping people,

regular in attendance, and reliable. The student enters the program in the eleventh year of high school. In addition to English and physical education, subjects studied include body structure and function and home and family living.

The cooperative phase of the program begins with the twelfth year and is spent in the local hospitals. Here the student obtains actual nursing experience and receives instruction in the fundamentals of nursing, including both medical and surgical nursing. The high school diploma is awarded upon the successful completion of the twelfth year.

After graduation the student remains at the hospital for several months to continue the practical experience and to complete the clinical courses required for admission to the state examination for practical nurses. Satisfactory completion of the examination is a necessary requirement for receiving the practical nursing license.

Syracuse, New York

In defining curricula offerings in the technical area, there are five courses of study students may pursue. They are technical chemical, technical electrical, technical mechanical design, computer technology, and technical physics. The technical curricula are planned and designed as a challenge to the most talented students who are interested in the applications of mathematics and science. The curricula have been planned in cooperation

with engineers and scientists from local industry, and have been approved by the State Education Department.

The general objectives of the technical curricula are:

1. To prepare students for engineering college entrance
2. To give students thorough preparation for employment as technicians or assistants to engineers.[1]

For the entire technical high school program, required subjects fill every period of an eight-period school day. At the completion of the program, at least 20 units have been credited, as compared with the 16 required by the State.

Graduates receive the standard Syracuse High School Diploma, and are also eligible for the State Regents' Diploma in Technical subjects.[2]

Industrial Program.

All eleven curriculums involve all the requirements for the regular high school education. Three full hours each day is spent in the specialized program, over a three-year sequence, (1800 total hours) preparing for entrance into one of the skilled industrial or service occupations of the community.

Instruction is offered by an instructor with nine or more years of experience in his specialty, in addition to his teaching training preparation. Included in these curricula are courses in applied mathematics, related science, elements of business operation and the reading of plans and

---

[1] "Introduction," Technical Curriculums (Syracuse, N.Y.: Central Technical High School Print Shop, n.d.).

[2] Ibid., p. 7.

blueprints. Although the immediate objective is preparation of graduates to enter employment, many do go on to college.[1]

The industrial arts curricula include:

Automobile Mechanics Curriculum
Carpentry Curriculum
Air Conditioning and Sheet Metal Curriculum
Beauty Culture Curriculum
Electronics Service Curriculum
Food Administration Curriculum
Fashion Shop Curriculum
Machine Shop Curriculum
Practical Nursing Curriculum
Welding Curriculum
Graphic Arts Curriculum

As indicated in "Guidance Guide to Comprehensive City-Wide Programs In Business Education," the Terminal Business Education Programs provide opportunities for training in four major fields: Stenographic, Bookkeeping, Clerical (Regular and Basic),[2] and Sales (Distributive Education). The programs are designed to lead to immediate employment upon graduation. As a part of each of these programs, selected business education students in their senior year participate in coordinated work-study experiences on a paid basis.

The following list of jobs available in the Metropolitan Syracuse area is a small portion of types of Entry Jobs available for Business Education Graduates who have successfully completed a vocational sequence in high school

    - Billing machine operator

Distributive Education
- Salesman (Retail trade)
- Salesman (Wholesale trade)
- Grocery clerk
- Stock clerk
- Cashier
- Service desk clerk
- Auto Service Station attendant
- Store cashier
- Telephone order clerk
- Hotel clerk
- Sales clerk
- Telephone solicitor
- Ticket seller

Data Processing

1. Basic Office Machine Operators
   - Data typist
   - Key-punch operator
   - Verifier Operator
   - Tape librarian
   - Card-tape converter operator
2. Peripheral equipment operator
   - Sorting machine operator
   - Tabulating machine operator
   - Encoding machine operator[1]

Students who plan to attend college and major in Business Administration, Secretarial Science, Accounting, Marketing, Sales or Business Teaching are offered a choice of concentration for preparation in either Secretarial Science or Business Administration. The College Preparatory Programs in Business Education provide an opportunity for the development of salable skills of a vocational nature.

---

[1] , Guidance Guide to Comprehensive City-Wide Programs In Business Education, Curriculum Bulletin No. 2 (Syracuse, N.Y.: City School District, Business Education Department, 1966-1967), p. 7.

The General Business Program of Study is designed for the development of limited job skills which might assist students in earning a living or in obtaining part-time employment to help finance post high school education. This program is established for those students who are undecided as to their future plans.[1]

Special Education Work Study Program. The special education work-study program is designed for those students who have been enrolled in the special education program. As no monies are available, the special class students must and are placed at work stations in private industry, Manpower Development Training, or if qualified, in the Vocational Work Study Program. Students fill such positions as service station attendants, dishwashers, maintenance helpers, and are placed in some types of stock keeping positions.

Yonkers, New York

Two high schools, Saunders Trades and Technical and the High School of Commerce, represent the City of Yonkers' endeavor to prepare youth for occupational efficiency.

---

[1] Courses Offered in the Syracuse Public High Schools, pp. 2-5.

Saunders Trades and Technical High School is a public secondary school for boys. It offers two different types of curricula.

Technical Education.

> Technical education is a curriculum intended to prepare a student to earn a living in a profession or occupation in which success is dependent upon technical information with an understanding of mathematics and science as they are applied to design and production.
>
> Ultimately, most of the graduates from the technical courses continue their education and eventually become the men who invent, design, write specifications, organize and supervise production and test the finished product.
>
> Those boys who do not choose to continue their education after graduation have little difficulty in finding employment in advanced technical fields.[1]
>
> The technical curriculum prepares the students for admission to engineering colleges and for positions on the technical level in the junior engineering field. Three year courses are offered in
>
> Architecture
> Chemistry
> Machine design
> Electricity--electronics
>
> Training in English, social studies, mathematics and science enables a student to meet college entrance requirements.

Industrial Education.

> Industrial education is a curriculum intended to prepare a student to earn a living in a job in which success is dependent mostly upon the

---

[1] , Saunders Trades and Technical High School (Yonkers, N.Y.: Saunders Trades and Technical Print Shop, 1964), p. 8.

skillful use of hand or machine tools together with the related science, mathematics and materials that go with the understanding and knowledge of mechanics.

Students following vocational curriculums obtain practical experience in shops equipped with machines and hand tools comparable to those found in industry.[1]

In their academic and related subject classes, they study the basic and advanced subjects to provide a program of general high school education. In the shops they obtain experience by using materials, handling tools, instruments and equipment used in the trade.

A trade curriculum prepares the students, upon satisfactory completion of the three year course, to enter the following trades:

Auto mechanics
Carpentry
Electrical work
Machine shop work
Automatic heating
Printing

The trade curriculum does not prepare students for further formal education. Graduates from a trades course will not be able to enter college without supplementary courses as prescribed by the college selected.

The High School of Commerce.

The High School of Commerce offers opportunities in eight different commercial and trade areas:

Secretarial
Bookkeeping
Office Machines
Clerical
Retailing
Cosmetology
Food trades
Trade dressmaking and design

---

[1] Ibid., p. 14.

Each curriculum includes all requirements for the approved New York State High School diploma.

Many Commerce students work part time during their junior and senior year, and this leads to permanent employment. By the time they have been graduated, the great majority of seniors have been placed in good paying positions.[1]

Last year while you were in school, you also worked and were paid by the school. You were participating in a program known as the Work-Study Program.

Now, the New York State Department of Education and Syracuse University are working on a work-study project. We need 10 minutes of your time to answer some questions about the Work-Study Program you were in last year.

Attached you will find a form which we would like you to fill out. This form will be shown to no one but those working on the work-study project.

You will also find enclosed a self-addressed, stamped envelope so that you may easily return this form by January 20th.

Your help will be greatly appreciated.

Very truly yours,

Gerald E. Benjamin
Research Assistant

STUDENT HISTORY FORM
(S.H.F.)
(Section A)

INSTRUCTIONS: Please fill in and complete the following form as best you can and return it in the attached envelope by January 20, 1967.

(Please Print)

1. Name: _____

2. Age: _____ 3. Sex: Boy ____ Girl _____

4. Who was the most important person responsible for your enrollment in the WORK-STUDY PROGRAM?

(1) Guidance Counselor___
(2) Teacher_____
(3) Homeroom Teacher_____
(4) Parent_____
(5) Principal_____
(6) Vice-Principal_____
(7) Friend_____
(8) Myself_____
(9) Other (Explain)_____

_____

5. If you previously left school, but returned to participate in the WORK-STUDY PROGRAM, what year did you leave school?

1963_____
1964_____
1965_____
1966_____

6. Father's or Guardian's Occupation
(Please be specific in giving JOB TITLE, for example, doctor, or truck-driver, or carpenter, or plumber.)

_____

(What does your father or your guardian do on his job?)

_____

_____

_____

7. Mother's or Guardian's Occupation
(Please be specific in giving JOB TITLE, for example, secretary, or housekeeper, or sales-lady.)

_____

(What does your mother or your guardian do on her job?)

_____

_____

_____

8. Father's or Guardian's Education Level (Please check)

1. Less than 8th grade _____
2. Completed 8th grade _____
3. Completed high school _____
4. Completed two years of college _____
5. Completed four years of college _____
6. List other educational experiences, (for example, apprenticeship program)_____

_____

9. Mother's or Guardian's Education Level

1. Less than 8th grade _____
2. Completed 8th grade _____
3. Completed high school _____
4. Completed two years of college _____
5. Completed four years of college _____
6. List other educational experiences, (for example, apprenticeship program)_____

_____

SYRACUSE UNIVERSITY

SCHOOL OF EDUCATION | DIVISION OF SPECIAL EDUCATION AND REHABILITATION

805 SOUTH CROUSE AVENUE | SYRACUSE, NEW YORK 13210

Last year while you were in school, you also worked and were paid by the school. You were participating in a program known as The Work-Study Program.

Now, The New York State Department of Education and Syracuse University are working on a work-study project. We need 10 minutes of your time to answer some questions about The Work-Study Program you were in last year.

Attached you will find a form which we would like you to fill out. This form will be shown to no one but those working on the work-study project.

You will also find enclosed a self-addressed, stamped envelope so that you may easily return this form by February 16, 1967.

Your help will be greatly appreciated.

Very truly yours,

Gerald E. Benjamin
Research Assistant

SYRACUSE UNIVERSITY

SCHOOL OF EDUCATION | DIVISION OF SPECIAL EDUCATION AND REHABILITATION

805 SOUTH CROUSE AVENUE | SYRACUSE, NEW YORK 13210

Perhaps last week you were so busy that you didn't have time to answer the form which was mailed to you.

Perhaps you thought your answers to the questions were not important for the work-study project. However, they are very important.

Would you please give us 10 minutes of your time this week?

Attached you will find a form which we would like you to fill out. As we said before, this form will be shown to no one but those working on the work-study project.

You will also find enclosed a self-addressed, stamped envelope so that you may easily return this form by Monday, February 27th.

Your help will be greatly appreciated.

Very truly yours,

Gerald E. Benjamin,
Research Associate

PROGRAM DESCRIPTIVE FACTOR SHEET (P.D.F.S.)

PROGRAM DESCRIPTIVE FACTOR SHEET
(P. D. F. S.)

I. District:_____

Superintendent:_____

Supervisor for Work-Study:_____

Specific Title:_____

II. Program History

A. How Initiated:

1. Was there a Work-Study Program prior to The Vocational Education Act Program?

Yes_____

No _____

2. Required modification of former program?

Yes_____

No _____

If it was a modification, list specific changes:

a.
b.
c.
d.

3. Extension of Work-Study Program? Yes_____

No _____

4. Student participants are drawn from how many high schools?_____ from how many junior high schools?_____.

II. B. 1. Number and Titles of members on Screening and/or Advisory Committee:

Screening Committee	Advisory Committee
1_____	1_____
2_____	2_____
3_____	3_____
4_____	4_____
5_____	5_____
6_____	6_____
7_____	7_____
8_____	8_____

2. a. Administrator's salary_____for_____months.

b. Was there an increase for those teachers and/or work station supervisors participating in the Work-Study Program?

Yes_____

No _____

c. If yes, How much?_____

3. What is their functional definition of eligibility for participation in the program? (On what basis do you classify Vocational Work-Study Program students?)

_____

_____

_____

4. Who is (are) responsible for student placements?

5. a. Have periodic evaluations been made to determine effectiveness of the work-study program in terms of the programs's objectives?_____

Yes_____

No _____

b. How frequently?

a. Start of program_____
b. Midway_____
c. End_____

APPENDIX J

D.O.T. DEFINITIONS OF FUNCTIONS

DEFINITIONS OF FUNCTIONS

DATA: Information, knowledge, and conceptions, related to data, people, or things, obtained by observation, investigation, interpretation, visualization, mental creation; incapable of being touched; written data take the form of numbers, words, symbols; other data are ideas, concepts, oral verbalization.

0 Synthesizing: Integrating analyses of data to discover facts and/or develop knowledge concepts or interpretations.

1 Coordinating: Determining time, place, and sequence of operations or action to be taken on the basis of analysis of data; executing determinations and/or reporting on events.

2 Analyzing: Examining and evaluating data. Presenting alternative actions in relation to the evaluation is frequently involved.

3 Compiling: Gathering, collating, or classifying information about data, people or things. Reporting and/or carrying out a prescribed action in relation to the information is frequently involved.

4 Computing: Performing arithmetic operations and reporting on and/or carrying out a prescribed action in relation to them. Does not include counting.

5 Copying: Transcribing, entering, or posting data.

6 Comparing: Judging the readily observable functional structural, or compositional characteristics (whether similar to or divergent from obvious standards) of data, people, or things.

PEOPLE: Human beings; also animals dealt with on an individual basis as if they were human.

0 Mentoring: Dealing with individuals in terms of their total personality in order to advise, counsel, and/or guide them with regard to problems that may be resolved by legal, scientific, clinical, spiritual, and/or other professional principles.

1 Negotiating: Exchanging ideas, information, and opinions with others to formulate policies and programs and/or arrive jointly at decisions, conclusions, or solutions.

2 Instructing: Teaching subject matter to others (including animals) through explanation, demonstration, and supervised practice; or making recommendations on the basis of technical disciplines.

3 Supervising: Determining or interpreting work procedures for a group of workers, assigning specific duties to them, maintaining harmonious relations among them, and promoting efficiency.

4 Diverting: Amusing others.

5 Persuading: Influencing others in favor of a product, service, or point of view.

6 Speaking-Signaling: Talking with and.or signaling people to convey or exchange information. Includes giving assignments and/or directions to helpers or assistants.

7 Serving: Attending to the needs or requests of people or animals or the expressed or implicit wishes of people. Immediate response is involved.

THINGS: Inanimate objects as distinguished from human beings; substances or materials; machines, tools, equipment; products. A thing is tangible and has shape, form, and other physical characteristics.

0 Setting Up: Adjusting machines or equipment by replacing or altering tools, jigs, fixtures, and attachments to prepare them to perform their functions, change their performance, or restore their proper functioning if they break down. Workers who set up one or a number of machines for other workers or who set up and personally operate a variety of machines are included here.

1 Precision Working: Using body members and/or tools or work aids to work, move, guide, or place objects or materials in situations where utimate responsibility for the attainment of standards occurs and selection of appropriate tools,

objects, or materials, and the adjustment of the tool to the task require exercise of considerable judgment.

2 Operating-Controlling: Starting, stopping, controlling, and adjusting the progress of machines or equipment designed to fabricate and/or process objects or materials. Operating machines involves setting up the machine and adjusting the machine or material as the work progresses. Controlling equipment involves observing gages, dials, etc., and turning valves and other devices to control such factors as temperature, pressure, flow of liquids, speed of pumps, and reactions of materials. Setup involves several variables and adjustment is more frequent than in tending.

3 Driving-Operating: Starting, stopping, and controlling the actions of machines or equipment for which a course must be steered, or which must be guided, in order to fabricate, process, and/or move things or people. Involves such activities as observing gages and dials; estimating distances and determining speed and direction of other objects; turning cranks and wheels; pushing clutches or brakes; and pushing or pulling gear lifts or levers. Includes such machines as cranes, conveyor systems, tractors, furnace charging machines, paving machines and hoisting machines. Excludes manually powered machines, such as handtrucks and dollies, and power assisted machines, such as electric wheelbarrows and handtrucks.

4 Manipulating: Using body members, tools, or special devices to work, move, guide or place objects or materials. Involves some latitude for judgment with regard to precision attained and selecting appropriate tool, object, or material, although this is readily manifest.

5 Tending: Starting, stopping, and observing the functioning of machines and equipment. Involves adjusting materials or controls of the machine, such as changing guides, adjusting timers and temperature gages, turning valves to allow flow of materials, and flipping switches in response to lights. Little judgment is involved in making these adjustments.

6 Feeding-Offbearing: Inserting, throwing, dumping, or placing materials in or removing them from machines or equipment which are automatic or tended or operated by other workers.

7 Handling: Using body members, handtools, and/or special devices to work, move, or carry objects or materials. Involves little or no latitude for judgment with regard to attainment of standards or in selecting appropriate tool, object, or material.

NOTE: Included in the concept of Feeding-Offbearing, Tending, Operating-Controlling, and Setting-Up, is the situation in which the worker is actually part of the setup of the machine, either as the holder and guider of the material or holder and guider of the tool.[1]

Brooke, Walter L.; DuBose, David C.
Instituting a Vocational Major in Natural Resources.

Shasta Coll., Redding, Calif.
MF AVAILABLE IN VT-ERIC SET.
Pub Date - Jun67 41p.

*SCHOOL SURVEYS; *AGRICULTURAL EDUCATION; *POST SECONDARY EDUCATION; *NATURAL RESOURCES; QUESTIONNAIRES; *CURRICULUM PLANNING
CALIFORNIA

Purposes of this survey were to identify job requirements for planning a "Natural Resources" curriculum, to estimate employment opportunities for students, and to apprise employers of the programs. Interviews were held with employers or personnel managers and employees to identify jobs and make job descriptions. This information pointed out 182 positions in six jobs where "National Resources" education would be essential, 212 positions in eight jobs where such education would be useful, and 130 positions in seven jobs where such education would be marginally related. It was found that the seven existing "Natural Resources" curriculum options might be compressed to two by reorganizing the present curriculum. The appendix contains interview forms, addresses of employers, and course descriptions. (EM)

INTRODUCTION

The economy of the three counties from which Shasta College draws most of its students is based largely upon the natural resources of the area. Activity relating to the development or regulation of our natural resources is on the increase. Within the past few years, Kimberly Clark Corporation, a wood processing firm, has completed construction on a pulp mill adding 1150 new jobs to an industry which leads all others in economic importance to our area. Utilization of water resources was expanded with the construction of three major dams: Trinity, Whiskeytown, and Black Butte. In addition, Pacific Gas and Electric Company has recently completed a series of dams on the Pit River adding new reservoirs to an already extensive power and water storage system. The economic importance of these water resources was further enhanced when it was decided to locate the regional office of the state Department of Water Resources in Red Bluff. This agency presently employees 113 people and will raise that figure to 1000 employees within ten years. The recreational usage of the lakes, streams and woodlands of northern California has also increased with state population growth and the improvement of highways linking the north state with the major population areas.

In the fall of 1966, Shasta College instituted a new vocational major designed to prepare students for jobs in businesses and agencies associated with the development or regulation of these natural resources. From the standpoint of student acceptance, the program

was an immediate success. Over seventy students declared a vocational major in natural resources and all classes were closed before registration was completed. This student acceptance was not altogether surprising. At Shasta College we have consistently had large numbers of students who begin college with the intention of completing a professional major in forestry, fish and game, or other majors related to the management of natural resources. And yet, despite the initial high enrollment in transfer programs, few of these students have gone on to state colleges or the university. A look at the test records of students who enroll in our two unit General Forestry course suggests why. This two unit offering is a survey course for students planning a professional career in forestry and other natural resource majors. Until the fall of 1966, when the vocational major in natural resources was instituted, this was the only course offered by Shasta College to students with an interest in natural resources occupations. We searched the school records for the ACT test scores of all students enrolled in this course during the school year which preceded the institution of the new vocational major. The ACT test is used nation-wide to measure the academic development of college students and is the entrance test used by Shasta College. The following table shows how students in the General Forestry course scored on this test when compared with typical college freshmen in four year programs.

TABLE 1

ACT Scores of General Forestry Students

ACT Composite Percentile Score	Number of Students Receiving Score
76% and Above	3
Between 51% and 75%	10
Between 26% and 50%	26
25% and Below	34

The test scores suggest that the greater proportion of these students would have difficulty competing with other college students in four year programs. The number of students who eventually transfer in forestry bears this out. Our records indicate that only slightly more than 20 percent of these students eventually transfer to a four year college

To summarize, Shasta College had two compelling reasons for instituting a vocational program in natural resources. First, we had become aware of a growing, if unspecified, job market for students with the kind of training provided by the natural resources major. And second, we had large numbers of students with interests in the field of natural resources whose educational needs we were not meeting.

Purpose of the Study

One of the most persistent problems in vocational education programs is the inability to generalize. If such programs are to

be successful, they must be practical and suited to the industries and agencies they are intended to serve. This is especially true of non-specific majors such as our vocational major in natural resources designed to prepare students for a variety of jobs. Although several organizations were invited to the college to discuss the program prior to its institution (see Appendix I), school officials were aware that the information gained from this discussion was insufficient and that a more systematic study of the program would have to follow. The information was considered inadequate as a guide in educational planning for at least two reasons. First, the agencies and businesses contacted were not completely representative of the organizations we intended the program to serve. And second, the discussion tended to center around the general acceptance of the program by the organizations and not upon the specific educational needs of students who would take jobs with the organizations. Consequently, the curriculum initially devised for the program cannot be considered final. One of the major purposes of this study was to examine the relationship between the natural resources curriculum and the training needs of specific jobs.

A second and related purpose of the study was to estimate the job placement potential in the Shasta College service area for graduates of the program. It was previously indicated that this vocational program has been received with great interest by the students. It would, however, be a tragic mistake to allow student interest to be the determining factor in the number of students we train.

Since classes in the major were filled to capacity and beyond immediately upon their introduction, it would seem that we could be in real danger of training more students than there are jobs to be filled. It is therefore as important to know how many students we can reasonably expect to place as it is to know the training needs of the jobs.

A third purpose of the study is one inherent in most surveys which accompany the introduction of a vocational program but is seldom explicitly stated. This is simply to make initial contact with the potential employer and make him aware of the existence of the program. Vocational programs not only must be developed, they must be sold. We felt that this usually tacit purpose should be formally incorporated since it has important implications for the design of the study.

PROCEDURE

The first step in the development of this study was to construct a list of all businesses and agencies in or closely adjacent to the Shasta Joint Junior College District whose principal activity was related to the natural resources curriculum. Agencies and businesses engaged in fish and game regulation or management, forestry, wood processing, range management, rural recreation, or public relations for an outdoor recreational enterprise were listed. To obtain an accurate estimate of available jobs, we endeavored to contact officials in each of the firms we had listed. This was essentially carried out although some of the smaller wood processing

firms and rural recreation enterprises were removed from the list when it became apparent that placement of students with these firms was highly unlikely. The list is shown in Appendix II.

To insure that the greatest benifit would be derived from the initial contact with potential employers, it was decided that a standardized interview would be used in the study. For the purpose of the study this seemed far better, if more time consuming, than the less personal mailed questionnaire. All interviews were conducted by a member of the teaching staff in the natural resources major. It was felt that this procedure would maximize communication and give the teaching staff additional insight into the training needs of their students. The counselor chiefly responsible for assisting vocational students in their educational planning accompanied the teaching staff member on several of these interviews and assisted in analyzing the data.

It was suggested previously that the title of the vocational major under investigation, "Natural Resources", does not refer directly to the activity of any given job, but rather to the general activity of a variety of businesses and government agencies. Many of the businesses and agencies contacted had vocational level positions which were not directly related to the natural resources curriculum and might be more appropriately filled by students from different vocational majors. To avoid an indiscriminate listing of all positions which could be filled with junior college graduates, a clear distinction between positions in a given organization was

needed. It was decided that a survey instrument incorporating questions relating to specific tasks performed on the various jobs would be appropriate for this purpose. Two standardized interviews were constructed for this study.

One standardized interview was developed for use with the employer or personnel manager of the agency or business. The interview record form is shown in Appendix III. In this interview, general information on the jobs in the organization was gathered. This included the number of the people working for the firm, the various job titles held by persons in the firm, the employers statement of the skills and experience necessary for the various positions, and the anticipated openings in the various positions.

A second standardized interview was developed to be used with employees of the firm. In this interview the employee was asked to describe the major duties and responsibilities of the job, working conditions on the job, the method by which he was selected for the job, and other important characteristics.

When the interviews were completed, the various job titles obtained in the interviews were listed. The number of positions encountered for each job was tabulated. The jobs were then assigned to one of three classifications: If the knowledge and skills developed in twenty or more units of the natural resources curriculum was essential to functioning on the job, the job was placed in category one. Since twenty units is the accepted minimum standard for a vocational major at Shasta College this seemed appropriate. It would be unrealistic to label a course of study a "major" where the

essential courses in the program constitute less than a third of the course work.

Jobs were listed in the second category if the course work in natural resources would be useful, but not essential. Jobs were placed in this category if skills in some of the natural resources courses were required for the job, but not enough to constitute a twenty unit vocational major. Jobs in this category were either too narrowly specialized to require two years of preparation (such as "lumber grader") or they were jobs where, although some course work in the major would be useful, the principal duties did not correspond to the natural resources curriculum.

Jobs were listed in a third category if the course work in natural resources was marginally related. If the course work in natural resources would serve only to acquaint the student with the general role of the organization and would be of little or no value in either getting the job over other applicants or functioning on the job once the position was obtained, the job was placed in this category. To be completely consistent, all jobs in the organizations surveyed other than those listed in the first two categories should appear in this one. This would make the list too long and pointless. What has been listed is the titles of jobs which by their title seem to be related to the natural resources curriculum but upon closer inspection of the duties depend on other kinds of training. It is important to note that all but eighteen of the 130 positions listed in this category are technical engineering jobs.

RESULTS

The following table outlines the findings derived from the analysis described in the preceding section.

TABLE 2

Importance of Curriculum to Duties and Tasks of Jobs In Organizations Relating to Natural Resources

Category One--Curriculum Essential

Job Title	Positions	
Forestry Technician	90	
Game Warden	38	
Fish and Wildlife Assistant	31	
Fish Culturist	19	Total=182
Range Technician	2	
Game Refuge Foreman	2	

Category Two--Curriculum Useful

Job Title	Positions	
Tank Truck Operator	79	
Scaler	53	
Lumber Grader	37	
Fire Control Aid	22	
Recreation Aid	12	
Recreation Supervisor	3	
Park Guide	3	
Park Attendant	3	Total=212

Category Three--Marginally Related

Job Title	Positions	
Engineering Aid	67	
Saw Filer	18	
Soil Conservation Technician	15	
Conservation Engineering Technician	15	
Water Resources Technician	10	
Materials Aid	3	
Geologic Aid	2	Total=130

The findings presented in table two show six jobs in which knowledge and skills can be considered "essential" under the definition used by the study.

In the following section, the six jobs which require twenty units or more of the course work in natural resources are discussed in the order of the frequency of positions indicated by our survey. The job for which there was the greatest number of positions is discussed first. The information below is not intended to be complete descriptions of the jobs. Only that information which is relavent to curriculum and placement is discussed. More complete information on these jobs is in the possession of Mr. David DuBose, instructor in natural resources courses at Shasta College.

Job Title: Forestry Aid or Technician Positions: 90

Principal Duties and Responsibilities: The duties vary somewhat with the position. In private organizations activities such as cruising and scaling timber, surveying lines and roads are likely to occupy most of the worker's time. With the U.S. Forest Service, which accounts for the majority of the positions, the work is broader. "Forestry technicians perform nonprofessional and technical forestry work in connection with the multiple-use management, conservation, development, utilization, and protection of the forest resources; or perform similar work in forestry research activities."

Pay Range: Pay for the work varies with the position and the amount of experience and education. At the GS-4 level in federal service where our graduates would qualify, the beginning salary is $4778 per year. The highest salary recorded for this job in the survey was $7810 a year. Other areas have persons with technical level training making $10,000 a year.

Placement Potential: Most organizations contacted were dependent upon a parent organization in determining their final planning for manpower needs; they were therefore unable to release exact figures. Many Forest Service districts use their technical level jobs as summer positions for four year forestry programs: where the supply of professional trainees in high openings are limited. One Forest Service official indicated that while districts vary in their hiring policy with regard to forestry technicians, districts are finding they can free professional foresters for other work. Further, professional foresters must move about to get the varied experience needed for promotion; the technician tends to give continuity to the programs of a district. For these reasons the use of technicians is on the increase. Taking the region as a whole the ratio of full-time technicians to professional foresters is three to one. The students trained in technical forestry would also qualify for positions on fire suppression crews. Table II indicates that many such positions exist in the area, but listing them under the "forestry technician" title seemed inaccurate since positions on fire crews might be more appropriatly thought of as being related to the Fire Science major here at the college.

Relation of Natural Resources Curriculum to the Job: According to the personnel officer in the regional office of the U.S. Forest Service, students with this major would have excellent employment opportunities with the U.S. Forest Service if the training is geared specifically to the tasks which will be performed on the job. In his opinion, the present curriculum appears to be too general. The more

specific the skills developed, the more likely the employee will be retained on a year around basis (skills in drafting and timber stand improvement are useful in this respect.)

Job Title: Fish and Wildlife Assistant Positions: 31

Principal Duties and Responsibilities: This is also a job with the Department of Fish and Game. The work is described as "Hatching, rearing and feeding of fish or game birds; cleaning troughs, ponds, pens and other fish or wildlife enclosures; liberating game birds or planting fish; removing barriers from streams, installing and maintaining fish screens, ladders, and traps; planting or cultivating wildlife cover or forage plants; installing and maintaining artificial watering devices and building protective cover for wild birds; collecting field data on fish or wildlife by censuses and other means; trapping, tagging, or marking of fish and wildlife; collecting fish and wildlife samples and specimens; as required, operates automobiles, trucks, tractors, pumps, fish loaders, and other types of mechanical equipment; keeps records; and does other work as required."

Pay Range: The pay for this job varies from $5820 to $6360.

Placement Potential: This job offers the best employment opportunity in the Department of Fish and Game. The applicant would be eligible on a state wide basis. The fact that his training was specifically related to the job would be in his favor on the exam.

Relation of this job to the Natural Resources curriculum: In interviewing officials from the Department of Fish and Game, it was pointed out that most of the opportunity for vocational students

is working in fish hatcheries. Most positions in game management are filled by graduates of four year programs. As was previously stated, this job offers a promotional opportunity to the job of Game Warden. It would be appropriate for the student to consider including the specified police science courses in his program if he is otherwise physically qualified. A second promotional opportunity exists to the job of Fish Culturist. For this position the police science training would not be necessary.

Job Title: Fish Culturist Positions: 19

Principal Duties and Responsibilities: "A Fish Culturist performs work in a major phase of the operation of a fish hatchery including installing and maintaining racks and traps; spawning fish; incubating eggs; hatching fish; feeding fish; cleaning troughs and equipment; grading and counting fish; maintaining hatchery grounds; keeping records; preparing reports; assisting in collecting field data on and fish and habitat; and does other work as required."

Pay Range: The pay for this job varies from $5772 to $7020 per year.

Relation of this job to the Natural Resources curriculum: The student would not be eligible for this job directly out of school. Ordinarily two years of experience is necessary in the Fish and Game Assistant job before application can be made for the job of Fish Culturist. One year of the experience requirement can be eliminated, however, with two years of college in courses in biological sciences or fisheries management.

Job Title: Game Warden Positions: 38

Principal Duties and Responsibilities: Enforces and prevents violations of laws and regulations relating to the conservation and protection of fish and wildlife. In connection with these duties the game warden issues warnings and citation, serves warrants, makes arrests and prepares and presents evidence in court actions. He will also investigate wildlife crop damage, advise landowners on counter-measures and issue kill permits. He feeds game birds or animals during unusual weather conditions and may assist in the planning of controlled hunts. He collects and reports information on the condition of fish and wildlife and their habitat. He may assist in fish planting and he may be called upon to speak at meetings of sportsmen's, civic, and other groups to explain fish and game laws and regulations and the Department's conservation programs.

Pay Range: The minimum salary is $7020 per year and the maximum is $8532 per year.

Placement Potential: Officials of the Department of Fish and Game state that the majority of these positions are filled from the Fish and Game Assistant job. Again, no exact figures are possible, but the applicant taking the test is eligible for positions on a state wide basis.

Special Requirements: Some screening must be conducted before students are encouraged to look to this job as a vocational objective. The applicant must have "ability to swim at least 100 yards and ability to row a boat; strength, endurance, and agility; normal hearing; visual acuity of not less than 20/40 in both eyes provided

the defective vision is not due to active or progressive organic disease; normal color vision; height not less than 5'8" and waist measurement not in excess of the measurement of the chest in repose. Age requirement minimum 21 years, maximum 40 years as provided by Section 854 of the California Fish and Game Code."

Relation of Natural Resources Curriculum to the Job: Although many of the courses necessary for preparing for this job are offered in the police science program at the college, it does not require enough of the police science units to constitute a police science major. It is quite important that a student preparing for this vocational objective have strong preparation in natural resources courses. Not only is an understanding of fish and wildlife critical to the job, but the student is not likely to be old enough to apply when he finishes his training. Since holding the Fish and Wildlife Assistant job for two years is one of the specific recommendations of the California State Personnel Board as a possible way of qualifying for the job, this preparation would seem most appropriate.

Job Title: Range Technician Positions: 2

Principal Duties and Responsibilities: The work consists largely of conducting surveys to measure the effects of brush control and removal programs. Sample plots are layed out and tallies of the animal life which can be supported on the improved range are made. The technician must have an understanding of aerial photographs and maps to function on the job.

Pay Range: The two technicians included in the sample were recently hired at the GS-4 level at a yearly salary of $4776 a year. The GS-7 level is probably the highest which could be expected in this specialization with two years of college.

Entry Potential: The U. S. Bureau of Land Management, with a total of 30 positions, employs only these two technicians. We were unable to find any other openings in the college service area which employed people with this job title.

Relation of This Job to the Natural Resources Curriculum: Both state and federal agencies contacted indicated that few opportunities exist for the A.A. Degree graduate in range management in this area.

Job Title: Refuge Foreman Positions: 2

Principal Duties and Responsibilities: Supervises the planting and irrigation of crops for birds in a game refuge. Local farmers are usually hired on a temporary basis for the actual planting of the crops.

Pay Range: Pay for this job was $7800 per year. No minimum was indicated. It was indicated that this was top pay for the job.

Placement Potential: No position has been open in this job for the past ten years.

Relation of This Job to the Natural Resources Curriculum: Although several courses in the natural resources curriculum appeared appropriate, the low placement potential makes further discussion meaningless.

RECOMMENDATIONS

Several recommendations seem warranted on the basis of the findings of this study. While staffing problems and coordination between departments are likely to be limiting factors in bringing about some of the suggested changes, it is felt the following recommendations merit the attention of school officials and the Natural Resources advisory committee.

1. It is recommended that the options of Range Technology, Rural Recreation, and Public Relations in the Natural Resouces major be eliminated: As table 2 indicates, few jobs exist in the college district for which such training is applicable. While it is true that some students with special advertising talent might find jobs in public relations, and also true that students choosing a rural recreation or range technology options might use the training if they have sizable acerage they are converting to recreational use, most students have neither the talent nor the real estate to make use of these specializations. It is suggested that these options be discontinued to avoid unrealistic planning on the part of students.

2. It is recommended that the Fish and Game Assistant option and the Game Warden option be combined: Both these options refer to specific job titles for the California State Department of Fish and Game. While both of these are listed as entry level jobs with the Department, six of the nine Game Warden positions open in the past year were filled by persons with the job of Fish and Game Assistant.

Those students who could not meet the physical requirements for the Game Warden position or who prefered work in fisheries could omit the police science units from their program and substitute courses which would prepare them for the job of Fish Culturist. Job opportunities would indicate that more courses in fisheries and fewer in game or range management would be appropriate.

3. It is recommended that greater emphasis be given to the Forestry option of the Natural Resources major and that the training offered the student be more specific to the tasks performed on the job: The student should certainly understand the phase of a logging operation in which he is likely to take part. For this reason scaling, marking, and identification of timber should be taught as specific skills. Timber stand improvement is also likely to be part of the technical forester's job. Techniques in tree planting, thinning, pruning, and disease control should be mastered. It would seem appropriate to include courses which would make the student familiar with the operation and maintenance of basic fire supression equipment (Fire Hydraulics and Fire Apparatus and Equipment) to increase his chances of getting the important first job. A separate lab might well be offered in the General Surveying course for Natural Resources students which would emphasize pacing, use of the compass, use of maps and aerial photo interpretation. To make room in the student's course of study for learning these specific skills it would seem that some of the general life science courses (Botany, Zoology, General Biology) could be eliminate and some of the general natural resources courses (Forest Management and Range Management, Natural Resources Conservation,

and Conservation Administration) could be combined and offered for fewer units.

4. It is recommended that the Wood Technology option remain an in-service training program in the evening division as it presently is: In discussing the feasibility of offering this option as a pre-service vocational major with officials of wood processing firms, it became apparent that students would have little or no advantage over any other applicant for a specific job. Almost all firms have union agreements which must be honored. Seniority plays as important a role in qualifying for a given job as pre-service training in most mills. In addition, most jobs are of such a specific nature that on-the-job training is a far more practical approach to qualifying for the job. It would appear that such wood technology courses as might be offered be suggested by officials of these firms. Students from the day program might be encouraged to include some of these courses in their study list where time permits, but this option should be clearly specified as in-service training to avoid unrealistic planning on the part of students.

SUMMARY

The two basic purposes of this study were, first, to gain information on job requirements for planning the Natural Resources Curriculum, and second, to estimate placement opportunities for students in the major. It was found that many of the initial courses planned for the major tended to focus on the general role of agencies and businesses and not upon the specific jobs open to vocational students

in those organizations. When specific job posibilities were considered, it was found that the Natural Resources options might be compressed from seven to two. Students would have better employment opportunities if they had each developed specific skills for a group of closly related jobs. Mention should be made of the third and less tangible purpose of the study--to make employers aware of the existence of the program. It is felt that the personal contacts made with employers to find what was needed in the actual work and the willingness of school officials to change the program to fit these needs will certainly improve the placement opportunities for students in this vocational major.

APPENDIX I

February 17, 1966

Dear Mr.

For several years Shasta College has been concerned about the number of students attending the college who have indicated a strong interest in such careers as forestry, fish and wildlife, range management, recreation management, wood technology and others. Many of these students do not transfer to four-year colleges; they either drop out of the college or change into other occupational pursuits because of the lack of course offerings designed to meet the needs and interests of vocational students interested in less than a four-year technical degree.

The college staff, in studying these occupations, identified certain basic requirements that are common to all of them. Since the common core of these requirements seemed to center around natural resources, a program of exploratory nature, with courses built around natural resources, has been developed. By placing the student in these courses and offering certain other optional courses, plus a strong on-the-job work experience program, it was felt that the student's interests could be met and the industry's needs served.

As there is no comparable program offered in any junior college in the United States there are no guidelines to follow. This will permit a pilot program to fit this area's needs and allow exploration of new ideas.

The administration and staff of the college join with the Board of Trustees in inviting you to meet and review the work already done and make recommendations on its improvement. It is hoped, through such a meeting, to explore the scope and possibilities of such a program with you.

Included with this letter are suggested courses and requirements for your perusal. The meeting has been set for Thursday, February 24th at 3:00 P.M. in the Faculty Dining Room at Shasta College.

Sincerely,

Gilbert A. Collyer
District Superintendent-President

dg

PLANNING QUESTIONNAIRE
NATURAL RESOURCES MAJOR
SHASTA COLLEGE

NAME: _____ ORGANIZATION: _____

ADDRESS: _____ PHONE: _____

Because of the wide range of experiences and training required to develop technicians for the Natural Resources occupations, cooperation between industry, governmental agencies, private individuals, and Shasta College is essential. Some of this cooperation could be in the forms of:

1. Providing work experience (on-the-job) training.
2. Making available outstanding individuals to instruct in specialized areas.
3. Serving on a Natural Resources advisory committee.
4. Or others.

1. Would your organization employ students who had successfully completed technician training in one of the Natural Resources options? _____

   Remarks:

2. Would your organization be willing to provide work experience (on-the-job) training while the student is enrolled? _____

   Remarks:

3. Would there be opportunity for summer employment in your organization? _____

   Remarks:

4. Could your organization aid the college by making available specialists to instruct in technical areas? _____

   Remarks:

5. Would you be willing to serve or have a member of your organization serve on an ad hoc advisory committee on Natural Resources? _____

   Remarks:

6. Your comments as to improvements of this program (additions, deletions, changes, etc.)

APPENDIX III

Interview Record Form

At Shasta College we are attempting to develop a vocational training program which will enable the student to function effectively as an employee in an organization such as your own as a skilled worker. Could we begin by listing the different positions your organization has which require training but are open to persons with less than four years of college?

(List Job Titles) 1._____

2._____

3._____

4._____

5._____

6._____

7._____

If you were hiring now for the first job we listed, what is the minimum training or experience you would expect of the person filling the position?

(Refer to number above) 1._____

2._____

3._____

4._____

5._____

6._____

7._____

This sheet describes the courses we offer in the Natural Resources major. Would you mind going through it with me to determine which courses would meet the training or experience requirements listed above? (where requirements can be met by course work, indicate by placing the course number over the requirement.

Related education: "Some of your employees are likely to need skills in addition to those gained in natural resources training. I have some questions on additional skills an employee might need. I would like you to tell me in which job these skills might be needed and in which it would just be desirable.

1. In which of the jobs we have discussed is the employee required to submit written reports? (Specify job number, get copy of form or describe the nature of report)

_____

_____

_____

_____

_____

2. In which job is the employee required to keep a set of books or understand an accounting procedure?

_____

_____

3. In which job is the employee required to have direct contact with the public? Could you describe the duties?

_____

_____

_____

_____

4. What equipment or machines, including business machines, is the employee required to understand, operate, or maintain?

Machine or equipment	Employee responsibility

Questions on Employment outlook:

1. How many of these jobs have you filled in the past year? (Show job number and the number hired.)

_____

_____

2. What is the outlook for new openings in the next two year period? (show position and the number to be hired.)

_____

_____

Reasons why we would hope you would look to Shasta College in the future as a source of new employees:

1. We will have seen the boy's work for two years and can help you evaluate.

2. The boy will have demonstrated he can stick with a program for two years; this will tell you something about his reliability and interest in the work.

3. He will have had a good basic training program-our grading policy will give you an indication of what he is capable of doing.

Interview Record Form

(Employee)

A. Job Title or Name:_____

B. Present Methods and Procedures of Work:
   1. Duties and tasks worker performs:_____

   _____

   _____

   2. Supervision received and given:_____

   _____

   _____

   3. Job relationships other than supervision:_____

   _____

   _____

   4. Materials, supplies, and machines the worker uses:_____

   _____

   _____

C. Working Conditions:
   1. Place of work--describe (inside--outside, etc.):_____

   _____

   Dangerous or harmful aspects:_____

   2. Day, week and hours of the work period:_____

   3. Amount and method of pay:_____

   4. Opportunities for promotion or advancement:_____

   5. Fringe benefits: health plan_____, Vacation_____

   retirement_____, other:_____

D. Methods of selection for the position:
   1. Tests:_____
   2. Interview:_____
   3. Transfer or promotion:_____
   4. Other:_____

Natural Resources Option

Fish & Game Assistant

Omit: Forest Propagation and Identification, Natural Resources Surveying, and Forest Products Technology
Add: Zoology, Botany or General Biology, and Crop Production 21A.

Forestry

Omit: Forest Products Technology and Water Resources.
Add: General Forestry, Botany, Zoology or General Biology, Crop Production.

Game Warden

Omit: Forest Propagation and Identification, Natural Resources Surveying, Forest Products Technology, Forest Management, Water Resources, Natural Resource Mechanics and Soils.
Add: Criminal Evidence, Criminal Investigation, Administration of Justice, Firearms, Criminal Law and Applied Psychology.

Public Relations

Omit: Forest Propagation and Identification, Natural Resources Surveying, Forest Technology, Natural Resources Mechanics and Soils.
Add: Advertising, Salesmanship, Introduction to Journalism, Publicity and News Service, Photography, and Applied Psychology.

Rural Recreation

Omit: Forest Products Technology, Natural Resources Surveying, Forest Management and Forest Propagation and Identification.
Add: Salesmanship, Advertising, Merchandising, Landscape Design, Agriculture Marketing and Agriculture Math.

Wood Technology

Omit: Fish & Wildlife Conservation, Natural Resources Recreation, Natural Resources Surveying, Range Management, Soils, and Natural Resources Mechanics and Water Resources.
Add: General Chemistry, Botany or General Biology, Applied Psychology, Typing, and Algebra or Agriculture Math.

Range Technology

Omit: Forest Propagation and Identification and Forest Products Technology.
Add: Crop Production 21A, Feeds and Feeding, and Livestock 12A.

Course Descriptions

Feeds and Feeding 11 (4)
A study of the constituents of feed, carbohydrates, proteins, fats, minerals, vitamins and water; their utilization by the animal body. The digestive system, the process of digestion and assimilation of the various constituents. A study of various feeds and their individual values. Computations of standard rations for livestock and the problems involved in practical feeding. (3 lect-1 lab.)

Livestock Production 12A-12B (4-4)
A study of beef cattle production, swine production, sheep production, and dairy production in the United States, but with emphasis upon California conditions. Breeds of livestock will be considered, feeding and management of those enterprises, the planning of an economic unit for each of those major livestock classes and the marketing of the product. (3lect-1 lab.)

Crop Production 21A-21B (4-4)
A study of the basic forage crops, including irrigated pastures, alfalfa, and the cereal hays, silage crops and sudan. Also will be the various field crops, major cereal crops and cultural and economical factors such as soil management, harvesting methods, cost of production, rotation, cultivation and irrigation practices, variety of crops, seed selection and pest control. (3 lect-1 lab.)

Range Management 22 (3)
Rangelands and forage crops of the Western United States. Basic principles of range management and their relationships to the management and their relationships to the management of wildlands for

livestock production, wildlife, water, recreation, and timber. Development of plans for effective production and utilization of range forage on selected ranges of the region. (2 lectures, 1 lab.)

Soils 23 (3)
Deals with origin, formation, composition, classification, and the physical, chemical and biological properties of soils; effect of soil and cultural practices toward soil productivity. The management of the California soils effecting maximum conservation as well as yield. (3 lect.)

Natural Resources Mechanics 32 (3)
Safety, operation and maintenance of trucks, tractors, equipment and tools. Maintenance of buildings, including plumbing and painting. The use of hand and power tools for wood, metal and concrete. (1 lect., 2 lab.)

Natural Resources Conservation 60 (2)
A study of the history and development of conservation of the United States and human population in relation to resources. It would also cover government programs and legislation as pertaining to conservation. Practical conservation practices applicable to improving natural resources, including soil, water, forest and rangeland. (2 lect.)

Natural Resources Recreation 61 (3)
Development and management of rural recreational enterprises. Including a study of National and State parks, forests and historical sites. Practical recreational practices including the development and operation of rural picnic, swimming, boating, horseback riding, game sport areas, hunting preserves and fishing waters. The organization and financing of federal, state, and private conservation programs. An analysis of conservation problems including tourists, advertising and record keeping. (2 lect. 1 lab.)

Natural Resources Surveying 62 (3)
The use of basic surveying equipment such as hand compass, staff compass, abneys, topographic and engineer's chain, use of the level and transit and the drafting of field data and maps. (2 lect., 1 lab.)

Conservation Administration 63 (2)
A analysis of conservation problems and public relations. The organization and financing of federal, state, and private conservation programs including a study of both federal and state fish and game laws. (2 lect.)

Water Resources 64 (2)
Scope, magnitude and significance of water resources. A study of the federal, state and private water programs and proplems. (2 lect.)

77

Forest Management 66 (3)
The development of forestry and the lumber industry, management and utilization of the forest resources, the development of forests, and the study of trees and shrubs in the U. S. and California in particular, including basic silviculture, timber sampling methods, forest protection and fire control, forest valuation and economies. (2 lect., 1 lab.)

Forest Propagation and Identification (3)
Methods of treatment of forest stands to insure continuous growth pertaining to forestry nursery management and the regeneration by artificial means. Dealing also with planting and land preparation for timber as well as Christmas tree stands. The identification and study of forest species and types common to western forests will be covered. (2 lect., 1 lab.)

Forest Products Technology 68 (3)
A review of the history of lumber and wood products industry, covering the wide range of products made or manufactured by the industry. The changes occuring in the field, job opportunities and skills needed. (2 lect., 1 lab.)

Wood Processing 69A-69B (3-3)
A study of the characteristics of the principal native species of wood. Basic structure of wood including chemical composition. The operation of certain wood processing machines dealing with special manufacturing processes. Skills such as grading, sampling and tallying would be stressed.

Fish and Wildlife Conservation 70 (3)
The study of plant and animal ecology from the standpoint of fish and wildlife management. Dealing with the main fish and game animals of California and the Pacific Coast, including waterfowl, upland game birds, and the various types of fresh water fish. The practical aspects of wildlife conservation and management would be emphasized. (The lab would include several full day or weekend field trips to game preserves and management areas. (2 lect., 1 lab.)

*MANPOWER DEVELOPMENT; *URBAN AREAS; MIGRATION; INNER CITY; *URBAN RENEWAL; GHETTOS; POPULATION TRENDS

This monograph is intended to provide planning and human resource agencies with certain essential perspectives on the urban labor market, and on the character of the changes taking place within it, in the hope of stimulating a stronger appreciation of the need for metropolitan-wide coordination in the manpower field. The relevance and adequacy of Model Cities Programs for coping with patterns of change, and impediments to change, peculiar to metropolitan labor markets are assessed. The decentralization of employment away from the centrally located slum unemployed raises new questions about the efficacy of the current emphasis on upgrading the supply-side of the urban labor market. It was noted that a "comprehensive" strategy, as represented in the Model Cities approach, may not necessarily be the one best suited for effecting social change. Population data changes by metropolitan and nonmetropolitan areas, trends in migration, jobs, and ghetto concentration are reviewed. Suggestions for isolating specific components in Model Cities proposals to heighten the mobility and adaptation of the ghetto labor force throughout the metropolitan area are delineated. (PS)

CENTER FOR THE STUDY OF UNEMPLOYED YOUTH

PURPOSE

The Center for the Study of Unemployed Youth of the Graduate School of Social Work reflects fundamental policies of New York University to reach out and contribute to the progress and development of the community.

The Center engages in a variety of activities designed to contribute to knowledge of the multiple problems faced by unemployed youth and to assist in the planning and administration of programs for such youth. By facilitating the interaction between practitioners and academic specialists, the Center hopes to improve understanding and skill in each area of concern resulting from the unemployment of young people. The activities of the Center are supported with funds provided by New York University, The Office of Economic Opportunity, The U.S. Department of Health, Education, and Welfare, and the U.S. Department of Labor.

PROGRAM

Research. The Center is currently completing a three-year study of changes in work attitudes and performance of youth enrolled in the Neighborhood Youth Corps in New York City.

Curriculum Materials. The Center develops training materials primarily through workshops and institutes, participated in by planners and operators of youth-work programs among federal, regional, state and community agencies. The curriculum materials are intended to serve the training needs of personnel engaged in youth-work programs at all levels.

Technical Assistance. The Center offers technical assistance in the planning, operation and assessment of Comprehensive Employment Programs and the Scheuer nonprofessional programs for selected metropolitan areas.

Training. The Center designs and conducts training programs for staff personnel of the Bureau of Work Programs.

PREFACE

Shifting trends in the pattern of urban and suburban growth have prodded urban authorities toward a wider acceptance of metropolitan-area approaches to planning. Fragmented and multiple independent jurisdictions, so advantageous for local electioneering, have come to be viewed as impediments to urban control of water and air pollution, transportation planning, and general urban sprawl. Demands for metropolitan-area planning or urban public school districts have been gaining a wider audience in recent years, but the parallel need for extending an area-wide approach to human resource problems in general, and to manpower problems in particular, has won only limited public recognition and support.

As part of the Center's urban concern, therefore, this monograph is intended to provide planning and human resource agencies with certain essential perspectives on the urban labor market, and on the character of the changes taking place within it, in the hope of stimulating a stronger appreciation of the need for metropolitan-wide coordination in the manpower field.

The exodus of industry, reflected in the decentralization of inner city employment, the growing separation of home and work, spurred by improvements in urban transportation, and social barriers operating through the housing and local labor markets, are leading factors in the spread of racial ghettoes and pockets of unemployment. These trends suggest the conclusion that the costs and benefits of shifting growth patterns are being unevenly shared within the metropolitan complex. The central cities are the immediate victims of these changes, but the interests of the associated suburban rings stand to suffer quite as much in the long run.

Recognizing the social costs and multiple causes of urban blight and poverty, the federal government has offered the Model Cities Program to help finance local efforts in urban rejuvenation. Thus a dual purpose of this paper will be to assess the relevance and adequacy of Model Cities Programs for coping with patterns of change, and impediments to change, peculiar to metropolitan labor markets. While the scope of the monograph clearly precludes a manual or "how-to-plan" approach, it is hoped that it may serve as a useful guide to shaping manpower planning in urban redevelopment strategies.

In preparation of this paper, the author visited a number of urban planners, officials and specialists in government, universities, and community manpower agencies in order to first gain an impression of what is being done in various localities to link up manpower and job development program to wider plans for urban redevelopment as prescribed for Model

Cities funding. A second, and more important consideration, was to learn what steps are being taken to promote metropolitan-wide redevelopment schemes which might even out some of the burdens that migration patterns and employment dispersal impose on the inner city and its contiguous "gray areas."

On the first point, officials and planners admitted to a stronger appreciation of the critical importance of manpower considerations to the success of urban redevelopment plans. There was general endorsement of a viable strategy for job creation and development to accompany community-wide plans for urban renewal, slum clearance, rehabilitation, new construction and social improvements. This awareness is also reflected in many of the Model Cities proposals that 188 localities have submitted.

There is much less appreciation of the need for metropolitan-area planning to cope with adverse trends in the labor market, or even a clear understanding of what these trends imply for urban policy-making. The growth of centrally located ghettos in tandem with the flight of jobs and middle-income residents to outlying areas is a perplexing challenge, many specialists conceded. Yet there is little consensus on specific urban economic and social approaches that might best adapt to these trends. This ambivalence is also reflected in many Model Cities applications, which are explored in greater detail in latter sections of the paper.

The introductory Section I stresses the centrality of employment and manpower problems in an overall approach to urban blight and poverty, and raises some questions about the effectiveness of certain multi-intervention strategies in the light of job dispersal to fringe areas. Section II reviews relevant data on conflicting patterns in urban migration and job decentralization in metropolitan areas; Section III examines various urban policy responses and feasible options posed by the growing inbalances in migration and jobs, and examines in particular the effect of barriers in transportation and housing market segregation on job opportunities for the ghetto population. Section IV considers the record and the potential of the urban renewal program on community employment. Section V delineates tentative suggestions for isolating specific components in Model Cities proposals which, coordinated with certain other manpower related projects, could serve to heighten the mobility and adaptation of the ghetto labor force throughout the metropolitan area.

My profound gratitude goes to Professor John F. Kain of Harvard University, whose useful insights and empirical findings on urban job dispersal and related housing market segregation aided the preparation of this paper. I am particularly indebted to Dr. Emanuel Tobier of the Regional Plan As-

sociation, Professor Bert E. Swanson of the Institute of Community Studies at Sarah Lawrence College, and the staff of the Center for the Study of Unemployed Youth, who critically reviewed the initial draft, and provided many valuable comments and suggestions for improving its focus and content. Finally, my thanks go out to all those in community and government agencies, too numerous to mention here, who afforded me the benefit of their precious time and experience in interviews and consultations. Of course, I alone remain responsible for any errors or shortcomings.

SECTION I

INTRODUCTION: 1. AN OVERVIEW OF THE PROBLEM

"Over, under, and through it all the expressways loop, tunnel and carve their way with the contemptuous indifference of a new order. The metropolis of which the central city is the heart grows continually, but in the city itself there are sinister portents of decline. Department stores stand empty: buildings are pulled down and turned into parking lots waiting for better times: offices follow their employees to the suburbs. On placards in Detroit buses a wide-eyed child reaches out exclaiming, 'There is more of everything downtown' — but every year there is less."

Peter Marris,
Journal of American Institute of Planners, (August, 1962).

The last decade of American urban experience has produced a vast amount of data which document a weakening of the central city as a viable economic unit. By practically all the conventional socio-economic indices cores of metropolitan areas are declining relative to their fringes. Since World War II most of the outlying portions of metropolitan areas have been growing rapidly in terms of population, income, capital investment and employment, while the core areas have been growing very little, and in many instances, have experienced actual declines. The diminution in comparative advantage of a central location for a wide variety of businesses has spurred their departure to outlying areas and, along with them, the disappearance of job opportunities for the central city's labor force, particularly the ghetto population, the decline in the rate of capital spending for city renewal, and the erosion of the tax base.

Moreover, the out-migration of people as well as jobs has been selective: persons, mostly white and well-to-do, in the mobile and productive ages (21-45), have constituted the bulk of those moving to suburban areas, while those remaining in and migrating to the inner city have increasingly been the non-white, the aged and the poor. Manufacturing and trade employment have led the flight to the urban peripheries much more than white-collar occupations. The former offers wider job opportunities to the underskilled and disadvantaged population concentrated in the core than does the latter. The urge toward lower-density living on the part of middle-income families with children has led many to choose suburban homes. But Federal policies in the field of mortgage insurance, which have generally favored single-family construction relative to multiple dwellings, have sparked this outward movement, as have public policies in the field of highway construction. Rapid postwar increases in family income have

strongly influenced residential density and automobile ownership, by way of reducing the former and increasing the latter, which in turn facilitates the fanning out of residences and workplaces over the wider metropolitan complex.

The core areas of metropolitan confines therefore confront a unique tangle of urban problems. Apart from the traditional burden of handling a day time population some 25 to 50 per cent greater than its residential population, a conjunction of social barriers and powerful economic forces operate to disperse and expand job opportunities in the urban fringes* and away from the very concentration of an available cheap labor supply, anchored in the declining areas of the center. These blighted areas are also the concentration of a formidable array of acute community social problems: delinquency, narcotics addiction, poor housing, family impairment, school drop-outs, unemployment, etc.

Meanwhile, the central cities continue to serve their historic function as "intake centers" for low-income migrants from outside the metropolitan areas. A steady flow of displaced rural Negro and Spanish-speaking minorities replace earlier migrations from abroad as the chief sources of inexperienced and underskilled manpower for blue-collar urban jobs. The majority of these migrants, like previous ones, concentrate in the older blighted areas of the core. But now, in contrast to previous migrations, they do so in a period of growing decentralization of employment-generating activity outside the core and over the broader reaches of the metropolitan area largely inaccessible to the job-needy disadvantaged of the inner city.

Urban policies attempting to offset these adverse trends have frequently resulted unintentionally in exacerbating the problem: public housing developments located in or on the edge of slum areas often serve to anchor the unemployed poor even more solidly to the ghetto, physically isolated from the newer centers of job expansion; urban renewal practices that result in displacement of workplaces employing sizeable blue-collar labor to then replan the sites for office buildings, chiefly using white-collar workers, or for upper-income housing; urban transportation policies absorbed almost exclusively with linking suburban commuters and centrally located white residences with downtown workplaces while bypassing transportation problems of ghetto residents.

The inadequacy of much of the current urban response to the issues posed by the spread of ghettos, job dispersal and joblessness in metro-

* "Urban fringe" and "suburban ring" are used interchangeably in this monograph to represent the entire area outside of the central city or cities of Standard Metropolitan Statistical Areas, as defined by the U.S. Bureau of the Budget.

politan cores has prompted new directions in Federal manpower programs, with the aim of rendering them more attuned to the employment problems of the disadvantaged in their urban context.

The Neighborhood Youth Corps (NYC), the nation's largest youth work program, channeled 70 percent of its job opportunities and funds into urban areas in 1966, reflecting increased efforts to enroll disadvantaged youth concentrated in inner city slums. Manpower Development & Training Act programs (MDTA) are placing heightened emphasis on projects in central cities aimed at reaching potential trainees with special labor market disadvantages. A new Comprehensive Employment Program (CEP) has been launched to provide immediate employment and a wide range of related job market services specifically in areas of stubborn concentrations of joblessness in major cities.

The Model Cities Program (MCP), authorized under the Demonstration Cities and Metropolitan Development Act of 1966, and now in its planning phase, attempts a large-scale and concerted approach to revitalizing blighted communities. This program, focusing on specific target areas in each demonstration city, envisages a simultaneous and integrated attack not only on poor housing, but also on subemployment and lack of services (e.g., health, education, recreation, etc.) as well as community physical improvement. It is the underlying assumption of MCP that the solutions to urban problems are to be found only in a coordinated approach mobilizing all the legislative tools and resources represented in existing independent programs and policies.

But the "concerted" approach, confined to blighted areas, is open to serious question if key factors in slum pathology are unemployment, or are tied in with the sweep of forces in the metropolitan labor market itself. Where unemployment and subemployment are chief factors, the case for a "comprehensive" approach is seriously weakened, since the latter would ignore the fact that some urban problems, like Orwellian pigs, are plainly more equal than others.

2. "Comprehensive" Versus Selective Attack on Slums

With the advent and development of the War on Poverty, a battery of measures have been harnessed to novel strategies for a concerted assault on the physical and social causes of urban blight. While these initial efforts represent a mere beginning relative to the total needs, and have been too limited and thinly spread for decisive impact, they nevertheless have served to promote a more adequate theory of social change, embracing a total approach to acute community problems and addressed to basic causes.

Community Action Programs (CAPs), funded under the Economic Opportunity Act (EOA) of 1964, represent a bold effort at mobilizing an assortment of weapons for combating community ills. Even though the jurisdictional limits of governmental funding sources are intensely parochial, the CAP through its agency base attempts to mount a concerted attack on an array of local programs by utilizing a complement of programs funded under separate specialized governmental agencies. Thus the CAP agency attempts to link the work experience assistance for welfare clients, authorized under EOA's Work Experience Program, to MDTA training programs that would complement the final step needed for economic self-support, even though each program is funded under separate agency auspices. Again, a CAP agency may receive Department of Housing and Urban Development grants for neighborhood facilities, authorized under the 1965 Housing Act, to finance the establishment of youth centers or health stations whose programs would be funded under EOA provisions.

It is precisely the opportunity to enlarge this scope for program coordination that inspired much of the design in the Model Cities strategy. The inherent weakness in an ad-hoc approach to local ills is underscored in the following statment:

> . . . For example . . . intensive pre-school training unaccompanied by other complementary measures will enjoy a low probability of success. For what happens is that the teacher's work is invariably undone by the adverse effects of the unreconstructed family and community contexts to which the children receiving the extra training return after school. Thus we are led to the need for revitalizing family and community. But just as the pre-school training program automatically becomes the province of the Board of Education, so the family-oriented programs become the property of other specialized units. The underlying real-world phenomena they deal with are unitary ones — problem children in problem families in problem communities . . .[1]

A similar recognition of the interrelated causes of poverty is found in the literature on the economics of underdeveloped countries. Gunnar Myrdal formulated a theory of "circular and cumulative causation"* to explain how a circular constellation of forces tend to act and react upon one another in such a way as to keep a poor country moored in poverty; and it is significant that the Model Cities program as well as the federal programs on juvenile delinquency and community action embody this perception from economic development literature:

> For example, a poor man may not have enough to eat; being undernourished, his health may be weak; being physically weak,

* See **Rich Lands and Poor** (New York: Harper & Bros. Publishers, 1957) Chap. II, pp. 11-22. References to all numbered footnotes are listed at the end of this paper.

his working capacity may be low, which means that he is poor, which in turn means that he will not have enough to eat; and so on. A situation of this sort, applying to a country as a whole, can be summed up in the trite proposition: 'a country is poor because it is poor'.[2]

Hence there has been of late wide acceptance of the necessity to develop concrete programs embodying a series of interrelated measures for attacking urban blight and poverty. The new stress is on strategies, i.e., those addressed to underlying causes rather than symptoms of urban decline. Thus the Model Cities guidelines invite localities to "concentrate on the strategy and program approach to solving problems in the area, not on a detailed project-by-project specification"[3] while recommending that a panoply of social components "be comprehensive so that projects and activities within each component reinforce each other . . . "[4]

This program, under the Department of Housing and Urban Development, constitutes a big stride in the long drive to make the Government's housing program more attuned to the social causes, as opposed to the physical symptoms, of neighborhood blight. It would help a limited number of selected cities plan and carry out comprehensive demonstration projects large enough to attack overall neighborhood decline, and increase substantially the low and middle-income housing inventory, while providing assorted social services needed to remake slum areas into viable neighborhoods. Thus physical reconstruction and rehabilitation would for the first time be combined with positive programs for the rehabilitation of people.

The shift away from the ad-hoc "bricks and mortar" project approach that has characterized past housing policy represents a heightened awareness by housing officials that no program designed to revitalize slum areas can succeed that does not come to grips with the social pathologies of slum life. Until now, urban renewal and public housing have been the two main programs, attacking urban blight and slums. Neither program contains specific elements tailored to deal with the social tangle of pathologies concomitant with slum living.

The fragmented site-by-site renewal policy was modified in 1955, when the urban renewal law was amended to require communities to have a "Workable Program for Community Improvement" to get urban renewal funds or public housing. This marked the beginning of the neighborhood approach to renewal and slum clearance, but the benefits from both programs have been mixed. The public housing program has been kept so limited that only a miniscule fraction of the housing needs of low-income familes is being met. Urban renewal operations, on the other hand, have had the effect of decreasing the available supply of low-income housing,

while shifting the slum tenants elsewhere to promote, form, and accelerate neighborhood decline.

The Model Cities approach, then, first of all, shifts the emphasis of renewal away from large-scale demolition and slum clearance — thus avoiding some of the social problems created by relocation and job displacement — to rehabilitation and neighborhood preservation. Secondly, the approach embodies a strategy for community regeneration through a multi-pronged intervention into the interlocking series of ghetto pathologies. The reasoning being that interrelated problems demand a "total" or comprehensive strategy for their alleviation.

Thus the content of a comprehensive Model Cities program is inferred from the purposes stipulated in Section 101 of the Demonstration Cities and Metropolitan Development Act of 1966 (See Appendix C) as including: total demonstration projects in revitalization of slums and blight; the expansion of housing, income, job and educational opportunities; reduction of welfare dependency and the incidence of crime and delinquency; the reduction of disease and ill health; the enlarging of recreational and cultural opportunities; and establishing better access between homes and jobs, and "generally to improve living conditions for the people who live in (blighted areas through) the most effective and economical concentration and coordination of Federal, State and local public and private efforts to improve the quality of urban life." Moreover, the eligibility criteria require that the program "make a substantial impact on the physical, economic and social problems in the model neighborhood area."

But while the fresh innovation of this program is praiseworthy compared to previous thinking in urban redevelopment, there is an elusive contradiction about a social strategy that purports to make a strong impact on intertwined community problems by a wholesale attack on all of them! A more realistic analysis of the process of social change reveals that all the factors identifed in a problem "tangle" are not of equal importance; there are primary factors which generate secondary influences that in turn intensify primary ones. For example, unemployment and marginal jobholding, a staple feature in urban slum areas, militates against the urge to plan for one's family and future consumption. This may encourage family fragmentation, a situation which is more amenable in the face of income uncertainty, and large households sharing accomodations intended for single-room occupancy — which may ease rental payment in the short-term (although requiring higher payment in the long-run). Both represent household adaptations to severe employment and income uncertainty, and these adaptations might in turn dampen the urgency of the quest for a more

secure income and employment situation. Hence a sound strategy of intervention would not be built around combating the surface manifestations of family fragmentation and inadequate housing — since program resources are severely limited. It would rather be concentrated upon the underlying need for enlarging employment opportunities to restore work incentives sufficiently to enable people to frame their own solutions for dealing with their community ills.

It is almost platitudinous to point out that involuntary idleness and subemployment, concentrated among the disadvantaged, are key afflictions in major urban centers; it is not always stressed, however, that an urban redevelopment strategy holds little promise that does not come to grips with an enlarging ghetto concentration on the one hand, and the progressive dispersal of job opportunities on the other, however successful other "social components" of a comprehensive program may be in attacking crime, poor housing, neighborhood blight, etc.

Problems in manpower utilization and development, particularly in their metropolitan context, are infinitely more complex and frustrating for urban policy-makers and planners than other aspects of community action concerns. This stems in part from the intricacy of the urban labor market itself, but it is due also to the many critical forces in the problem outside the control of local authorities. Most community efforts at alleviating urban joblessness have been concentrated on the supply side of the labor market, i.e., remediating the poor to fit existing or presumed vacancies. Yet, if "upgrading" the potential labor supply through job training activities is a strategy that encounters fewer institutional and market barriers than aggressive job development programs for the disadvantaged — as some observers have noted — it is also a strategy that runs a high risk of generating dangerous despair in the event viable jobs do not materialize on conclusion of the training. It is not surprising, therefore, that a national evaluation in 1967 of the community action programs for the OEO by the Yankelovich Corp. reported that job training and job placement programs were the "least successful" of CAP activities. Given the centrality of manpower problems in the root causes of urban poverty, this failure could be another item in the-operation-was-successful-but-the-patient-died department.

Such a cynical dismissal, however, would be both unfair and inaccurate. The hostility of established local forces to some aspects of CAP activities has plunged many programs in incipient and continual struggle for sheer survival, and therefore probably discourages or enfeebles effective combat in the sometimes intractable manpower field. More importantly, the CAP

manpower role has contributed to a much sharper definition of the geographic and structural dimensions of urban employment problems, particularly among the slum disadvantaged.

Yet it cannot be overstressed that there are no substitute or alternative benefits in other areas comparable to success in the manpower field. As a corollary, the failure to come to grips with chronic urban unemployment and underemployment probably devalues whatever gains scored in other areas of social action. No amount of discussion on "tangles of pathology" should becloud this point. Since employment problems are the leading links in the "tangle," gains in this area produce large spillover benefits all along the chain, and failures undercut gains scored elsewhere. Granted that the vicious tangle of poverty represents a total self-reinforcing system, such that every community problem generates heightened individual and family problems which further exacerbates the community condition, it does not follow that each community "problem" must be simultaneously taken in tow by action on all fronts — which is what the Model Cities Program purports to do.

3. Job Dispersal and Program Planning

Moreover, the strategy of upgrading and adding to the potential labor supply blithely ignores what is happening to the location of jobs and people in urban centers. With the decentralization of workplaces from urban cores to outlying portions, inaccessible to ghetto work seekers, inordinate concentration on the supply side of manpower is cruelly misplaced. If the demand for labor "suburbanizes," it is then hard to resist the conclusion that the supply must suburbanize with it. This would suggest that supply-side measures should be directed more toward heightening the **mobility,** rather than the **employability,** of centrally located work seekers.

At the same time, federal manpower and Model Cities planners will more and more have to think in terms of the "commuting orbit" and the metropolitan labor market, in framing measures directed at ghetto joblessness. Improvements in urban transportation have already induced business firms, as well as mobile work seekers, to utilize these larger geographic frames of reference. It is in this context that "concerted" programs may realize their strongest potential. The "scattering" of publicly supported low-cost housing can then be weaved into a strategy to improve (1) metropolitan job market information (2) mobility of disadvantaged work seekers, and (3) ghetto transit links to outlying workplaces. Such a comprehensive strategy would require the intimate coordination of at least three separate cabinet-level jurisdictions at the Federal level, not to mention considerable

cooperation and accord between fragmented jurisdictions at the metropolitan level.

The declining areas of the nation's central cities are plagued by more and less urgent problems, which must be identified in some order of priority so that a workable strategy of intervention at specified critical points can be devised, and the "leading links" of the tangle can form the basis of that strategy.

As was noted above, the "leading links" in the chain of urban blight and poverty are the marginal jobholding and jobless disadvantaged concentrated in the declining core areas of major cities, whereas the available jobs are dispersing rapidly to the virtually out-of-reach periphery of the metropolitan labor market. Moreover, government policies in the areas of urban renewal, housing code enforcement, highway building and land use have probably resulted in a substantial net displacement of inner city jobs, in tandem with the more familiar hardships to low-income housing welfare.

During the hearings before the Ribicoff sub-committee dealing with problems of the cities, Senator Robert Kennedy stated.

> . . . . The crisis in Negro unemployment . . . is significant far beyond its economic effects . . . For it is both measure and cause of the extent to which the Negro lives apart . . . More than segregation in housing and schools, more than differences in attitudes or life styles, it is unemployment which marks the Negro of the urban ghetto off and apart from the rest of us — from Negroes who have jobs . . . almost as much as from whites. Unemployment is having nothing to do — which means having nothing to do with the rest of us.[5]

The high incidence and duration of joblessness and marginal employment over the last decade, disproportionately borne by inner-city Negroes and Spanish-speaking minorities, is said to generate a "pathological" culture of ghetto poverty which heightens the incidence of physical and emotional illnesses, inducing labor force withdrawal or non-entry, estrangement from conventional work-seeking patterns, and disinterest in job or vocational training programs to upgrade skill levels.

All of this continually frustrates efforts at central city renewal and serves to nullify the impact of most manpower retraining schemes in the War on Poverty. In his proposal for "An Action Program for Urban America," Senator Ribicoff observed:

> The most obvious fact in America is that a good job at an adequate wage is the key to providing self-respect for an individual and progress for a nation. We have known this lesson for years. Yet our overall manpower situation still troubles us — and in the central city it depresses us — economically and psychologically.[7]

If work in American society is the key to independence, status and self-respect, what happens when the value system extolling the ethic of hard work and achievement, comes to be perceived as at odds with reality? It has been suggested that this situation creates a tension-provoking dissonance, causing the individual to seek anxiety-reducing solutions to his internal conflict. What occurs is a restructuring of values in order to resolve the dissonnance, probably taking the form of a general devaluation of work as a means of obtaining money and the substitution of alternative means.[8]

> Specifically, it is felt that children from lower social economic class environments are confronted with work-value dissonant situations. On the one hand they do receive a work orientation, and on the other hand they are daily confronted with chronic long-term unemployment in the family and in the community. Moreover, among the lower-class Negro population, the situation must be somewhat more severe — even in good times, the structure of opportunities for the Negro is considerably more closed than it is for the lower-class white.[9]

The growing awareness of the deleterious psycho-social effects of sub-employment, poverty and other undesirable conditions prevalent in central city ghettoes has prompted widespread demands for corrective action, ranging from "more police protection" to increased public housing and urban renewal.

Measures aimed at improved housing assumed that this would result in heightened tenant morale and diminished community ills. Controlled studies have confirmed that improved housing reduces the incidence of illness and death.[10] There is even some evidence from a recent housing demonstration project in Washington, D.C. that the shift to better housing is a positive influence in raising family income.[11] Yet studies reveal that public housing tenants, when compared with slum residents, showed somewhat higher morale and greater pride in their neighborhood, but few differences in inner feelings, i.e., in the way of heightened aspirations for jobs, for their children, or for home ownership.[12] The authors noted that other circumstances in the material existence of the families studied (e.g., jobs, incomes, etc.), remained unaffected.

Multiple regression techniques, when feasible, provide a useful way of isolating and measuring the relative contribution of different social characteristics to a community's tangle of problems. The Haryou Report employed this method in tracing the roots of Harlem's social pathology chiefly to the low education, employment and income status of its inhabitants.[14]

Indices of poor housing scored low coefficients, confirming earlier studies that housing, while perhaps boosting morale, does not appear to

affect the more fundamental variables of low economic status and limited aspirations. Male unemployment also had only a limited influence on the results. This apparent contradiction, in view of the other findings, is probably explained by the marginal employment status that characterizes the majority of Harlem's workers, and which obliterates the significance of the conventional distinction drawn between having "a job" and being unemployed. As was noted by Senator Ribicoff:

> . . . Employment and manpower are constantly shifting factors. When men can slide into poverty very quickly, there is always a fear of layoffs and underemployment.[15]

Hence the sub-employment status, which characterizes a disproportionate number of central city ghetto inhabitants, inflicts grave psychological as well as social damage and operates as a barrier to efforts at rejuvenating blighted areas of our major cities.

To summarize, in this section, we have examined three core assumptions.

(1) We reviewed feasible strategies for policy intervention into intertwined community problems. In this connection it was noted that a "comprehensive" strategy, as represented in the Model Cities approach, may not necessarily be the one best suited for effecting social change: the spread of resources and energies over multiple intervention points serves to attenuate and enfeeble the total programmatic impact on any given problem.

(2) The tangled chain of community ills in central city ghettoes demands a strategy of forceful intervention **only** along those fronts that can be identified as "leading links" in the chain, and

(3) The decentralization of employment away from the centrally located slum unemployed raises new questions about the efficacy of the current emphasis on "upgrading" the supply-side of the urban labor market.

What are the dimensions and peculiarities of job dispersal in metropolitan areas? What compelling issues do these factors raise for urban policy-making, and what options do they offer urban authorities and social planners?

These questions are explored in the following section.

SECTION II: TRENDS IN MIGRATION, JOBS, AND GHETTO CONCENTRATION

The metropolitan area has become an established phenomenon in 20th Century America. Broad technological and economic changes occuring in the field of transportation and in the nature of production have made possible a fanning out of plants, residential developments and shops over a wide expanse around the older central city. Thus the nation's 212 Standard Metropolitan Statistical Areas (SMSAs) — as defined by the Bureau of the Budget — contained an estimated 124 million persons in 1965, or 64 percent of the nation's population, the remainder residing in non-metropolitan and rural areas. Within the SMSAs, slightly less than half, or 48 percent of the population resided in central cities, the majority now living in suburban rings. This is the exact reversal of the situation in 1960, when 52 percent of the metropolitan population inhabited the central cities. The latest estimated breakdown in the dimensions of these shifts is represented in Table I below.

TABLE I

POPULATION CHANGES BY AREAS, 1960 & 1965 (in Millions)

	1960	1965	% Increase 1960-1965	Average Annual 1950-1960	% Increase 1960-1965
Metropolitan areas	112	124	10.2	2.3	1.9
Central cities	57	60	3.2	1.0	0.6
Suburban rings	55	64	17.7	4.0	3.3
Nonmetropolitan areas	66	68	3.4	0.8	0.7

SOURCE: U.S. Bureau of the Census, **Pocket Data Book, U.S.A., 1967,** Table 8, p. 41.

By any measure metropolitan growth has been rapid but unevenly distributed. The suburban rings of cities have experienced sharp increases in population, while the center areas have grown much less rapidly and for a number of key cities, populations declined in absolute as well as relative terms. Figures since 1960 show no abatement of the suburban persistence of metropolitan residential choices.

The dynamics of changes in the location of people and jobs differ markedly between large, medium and small population centers. The Economic Development Administration of the U. S. Department of Commerce has derived certain estimates of the relationship between county size and projected employment growth rate for the period 1960-1975. These data are summarized below in Table II.

The results indicate that job growth in both low population counties and those with large populations, such as counties included in major urban complexes, will be at a much lower rate than growth at the national average. Moderate size counties, on the other hand, with populations between 50,000 and 500,000 are expected to have a job growth rate considerably higher than the national average.

More significant are projections for population and job growth in metropolitan areas, since they include nearly two-thirds of the nation's total inhabitants. These estimates, based on different assumptions, sought to determine what would be the relationship between future jobs and future population, both for and within metropolitan complexes, assuming no migration occured into or out of those with more than 1 million inhabitants. Again the results (See Table III) are striking. The estimates suggest that major urban complexes are faced with a serious problem of providing their inhabitants with jobs and that a large-scale process of economic shifts will have to take place **within** the metropolitan areas.

Note that this somber conclusion is drawn from Table III even though the results were based on the most optimistic assumption of no additional migration to the major cities. For the data indicate that in order to achieve an unemployment rate of 4 percent, there must be a net outmigration of

TABLE II

RELATIONS BETWEEN COUNTY SIZE AND PROJECTED EMPLOYMENT GROWTH RATE FOR 1960-75*

1960 counties or local governments with population of	Number of counties	Percent with projected employment growth less than national average
Less than 10,000	823	82
10,000 to 50,000	1,652	71
50,000 to 500,000	531	26
500,000 to 1,000,000	49	65
Over 1,000,000	16	87

SOURCE: Paper by Jonathan Lindley, Dep. Asst. Secretary for Policy Coordination, Economic Development Administration, U.S. Dept. of Commerce, presented to Eighth Annual Conference Center for Economic Projections, National Planning Assoc., April 28, 1967.

* Assuming 4 percent national average unemployment rate.

population of more than 6 percent from the ten largest urban complexes, and 5 percent from our 29 largest urban complexes over the 1960-1975 period.

This sizeable imbalance is projected even while taking into account the offsetting growth of jobs in the corresponding suburban rings of these cities. Of course, if the "no migration" assumption is relaxed, then the problem of imbalance becomes all the more acute. Indications are that migration to the cities of the rural poor and displaced segments of the Negro population will continue, although at a somewhat diminished pace. However imperfect these estimates may be, if the basic trends are correct, they at least signal the likelihood of a serious mismatch of people and jobs in most major urban centers in the near future.

More revealing than projected population and employment shifts between central cities and urban fringes are the changes taking place in ethnic and status compositions of the inhabitants. Between 1950 and 1960 the Negro population in central cities of the 12 largest metropolitan areas increased to more than 20 percent of all residents. These 12 central cities lost over 2 million whites and gained just under 2 million Negroes.

TABLE III

Short-fall of jobs in major urban areas assuming no migration — Urban complexes of over 1 million population, 1966-75 migration required to balance people with jobs, assuming a 4 percent rate of unemployment.

(Millions of people)

	TOTAL		
	10 largest complexes	29 largest complexes	Excluding California, 25 largest complexes
1975 population if no migration occurs into or out of the complexes	63.0	96.6	72.6
Migration required by 1976 to balance people and jobs, total	— 4.0	— 4.6	— 7.1
Central cities only (exclude suburban rings)	— 5.9	— 7.4	— 8.4
Associated suburbs and outer ring areas	+ 1.9	+ 2.8	+ 1.3
Migration required to balance jobs and people as percent of 1975 population	— 6.3	— 4.8	— 9.8
Comparable 1950-60 migration rate (in %)	+ 6.5	+ 10.0	+ 6.1

SOURCE: Same as Table II.

(Note: "+" means in-migration; "—" means out-migration)

Table IV is to some extent, a measure of the expansion of central city black ghettos rendered possible by the flight to the urban fringes of the residential white population.

Between 1960 and 1965 the Negro population in all central cities taken together increased again by 20 percent, (See Table IV) while the white population in these areas actually declined, for the first time, and by about 1 percent, or more than 400,000, as suburban migration more than offset gains from population growth. The growth in the non-white population in central cities between 1960 and 1965 was at an even faster pace than in the previous decade. Official data reveal that the Negro population, age 15 and over, rose by 1.1 million during the period.

At the same time, Negroes have been unable to make many inroads into suburban ring areas where the dominant proportion of investment in in-

TABLE IV

COMPONENTS OF POPULATION CHANGE IN CENTRAL CITIES FOR PERSONS 15 YEARS AND OVER, BY COLOR AND AGE, 1960-65

Color and Age	Absolute Change (thousands)			% change in total population 1960-65
	Total	Due to migration	Due to natural growth	
Total	696	–1,001	1,697	1.7
15 to 19 years	844	65	779	21.3

SOURCE: Manpower Report of the President, 1967, Table 3, p. 92.

dustrial construction and employment activity is moving. The Negro population increase in core cities, mainly in the rundown areas, and of whites in the associated suburban rings, are the combined result of natural growth and migration, with the latter accounting for about 60 percent of the respective increases.

Next to the Negro youth population (which rose by 50 percent between 1960-65), the most rapidly growing segment of the central city Negro population are persons aged 45 and over, whose numbers increased by 15 percent in the short five-year span. This group faces the double handicap of racial and age discrimination in employment complicated further by relatively low education and skill levels.

The rapid urbanization in the non-white population and its growing concentration in the larger central cities is reflected in the following figures. The twenty large central cities where Negroes were estimated to number at least 100,000 in 1965 were the residence of approximately one-third of the total Negro population in the United States (See Appendix A). These same cities contained less than 20 percent of the total white population.

The rapid growth in the composition and concentration of the non-white population in the cores of the nation's larger metropolitan areas has been in response to the wider range of employment opportunities and superior public services offered by such areas. These factors facilitate the adaptation of newcomers to an alien social climate, with the important difference that the current in-migration of the rural poor and non-white disadvantaged lack the prospects for job growth that earlier migrant waves had, owing to the shift to the outskirts of the inner city of the old urban industries that offered work to the underskilled.

Finally, urban renewal operations, and particularly industrial and expressway construction, have resulted in large-scale displacements of slum residents in particular localities, forcing those displaced to crowd into adjacent neighborhoods to accelerate slum formation, or to intensify the pressures on suburban communities ("gray areas") situated just outside the legal boundaries of the central city, which sets the stage for the well-known "border conflicts" now plaguing a number of metropolitan areas.

The exodus to the fringes by the residential white population along with rising concentrations of Negroes in central cities is expressed also in changes in conventional indices of socio-economic status. These denote shifts in median education, percent of population in white-collar occupations, and relative changes in personal family income. As shown in Table V, which summarizes 1960 Census data for 200 urbanized areas, central

cities suffered a diminution in the percent of their population in white collar trades, and improved much less spectacularly than their suburbs in terms of rises in family income and median school years completed.

TABLE V

CHANGES IN SOCIO-ECONOMIC STATUS OF POPULATIONS, CENTRAL CITIES AND SUBURBAN RINGS, 1950 & 1960

	1950	
	Central Cities	**Suburban Rings**
Median School years completed	9.9	11.1
% in White collar occupations	45.2	46.9
Median Family income	$2,249	$2,499
	1960	
	Central Cities	**Suburban Rings**
Median School years completed	10.7	12.0
% in white collar occupations	40.6	50.3
Median family income	$5,945	$7,114

SOURCE: **Census of the Population,** "Advance Reports," Series PC(A3)-1 Table 100

GAPS IN URBAN EDUCATION, INCOME AND AGE

There is also a widening gap between central city-suburban income and educational levels in metropolitan areas. This gap is duplicated within the central city itself between the ghetto communities and the rest of the inner city. Two-thirds of the residents in the former had less than a high school education compared with 45 percent of the latter. For example, in the suburban ring communities of New York City, in 1960, more than 52 percent of all residents had at least a high school education compared with only 37 percent of New York City residents; in the city's two major ghettos of Central Harlem and Bedford-Stuyvesant, on the other hand, less than one in four residents completed high school.

With the large growth in the Negro teenage and young adult population (which is usually better educated than previous slum generations), a corresponding rise in the average educational level of urban slum residents has been observed. Between 1960 and 1966, median school years completed increased from 8.3 to 10.4 for people aged 25 and over in slum areas of ten large cities surveyed by the Bureau of Labor Statistics.[1] Nevertheless, the educational attainment of ghetto slum residents is still far below the central cities of which they are a part. Similar differences exist for income comparisons: Suburban ring average family income in 1964 exceeded that

of central cities by nearly 20 percent; but central city family income still exceeded inner city slum family income in major cities by more than two-fifth.[2] Changes in family income summarize the deteriorating position of slum residents relative to other parts of the metropolitan area. In areas where current data are available, slum family income failed to keep pace with income in the rest of the same city or the country as a whole. Family income in Cleveland's poverty neighborhoods, for example, rose by barely 7 percent between 1959 and 1964, compared with a 17 percent rise in the remainder of the city, and 9 percent nationally. Ghetto neighborhoods of South Los Angeles had a rise in family income of only 4 percent, and in East Los Angeles income remained virtually unchanged between 1959-64, compared with a rise above 8 percent for the rest of the city as shown below:

	1959	1964	Percent change
Cleveland:			
Poverty neighborhoods	$4,937	$5,259	6.5
Remainder of city	6,558	7,642	16.5
Total, United States	$5,417	$6,882	8.6
Poverty neighborhoods, South Los Angeles	4,497	4,669	3.8
Poverty neighborhoods, East Los Angeles	5,094	5,106	.2
Remainder of Los Angeles	7,185	7,800	8.3

SOURCE: Manpower Report of the President, 1967, p. 89.

It is clear that family purchasing power in these and many other slums actually dropped during the period since the national Cost of Living index for urban families rose by more than 8 percent between 1959 and 1964.

Of all persons of working age classified as poor (by the Social Security Administration's Index) in 1964, half the whites and about 80 percent of the Negroes lived in central cities. Moreover, median family income in every occupational group studied, from relatively low-paid laborer categories to higher-paid professions, was from 10 to 20 percent lower among city than suburban residents.[3]

Important median age differences have also resulted from the selective pattern of migration from inner cities to urban fringe communities. For example, a community with a large fraction of its residents mainly below 18 and/or over 65 years of age has possibly greater service needs and less economic potential than a similar area with a high proportion of its residents in the 18 to 64 age bracket. Thus the major central cities have a growing number of residents in the "dependent" ages — under 18 and

over 65 years of age, whereas their urban fringe areas enjoy a larger proportion of residents in the economically productive age ranges, and a marked deficiency of elderly persons.[4]

The manpower implications of these demographic shifts between core city and fringes are clear, at least for the older, major central cities where the pattern of changes has been most consistent: The suburbanized zones have the highest concentration of workers in the professional and managerial classes while the central cities more and more contain the bulk of persons in the blue collar jobs and the lower-paying service trades, those too old or too young to work, the poorly educated and the unemployed.

It would be a mistake to consider these trends as dramatically new or unperceived developments. The current picture is in part the culmination of long-term tendencies that have been in the making for decades. We have earlier alluded to the historic role the central city serves in helping new-comers adapt to an urban environment, and long before most of the present trends became readily obvious, sociological models (e.g. E. W. Burgess') forecasted that higher-status residents would tend to settle in the suburban-rings while the central portions would be composed of the newest immigrants and those whose earning powers condemned them to inexpensive or rundown residences*. But whereas in the past, large scale income-generating activities were concentrated in the central city and grew apace — or at least in some tolerable balance — with a burgeoning underskilled labor force, these activities have now become more widely dispersed throughout the metropolitan area, with preponderant growth taking place outside the central portion. This is the heart of the imbalance between available manpower and shifting sources of utilization now taking shape in metropolitan areas.

DISPERSAL OF JOBS TO OUTLYING AREAS

The much discussed relative and absolute declines in income-generating activities in central cities, and particularly in their central business districts (CBD's) have been the outcome of a confluence of technological and economic changes that have made de-centralization a more feasible, more economic, or more desirable choice for many businessmen as well as households. Great strides in transportation and communications have spurred locational choices on the urban periphery where land assembly for large-scale developments and for one-story "flow-through" factories is

* Note: While this pattern is found to be valid for the older established central cities of the East and East Central parts of the United States, it is less true for the relatively younger central cities of the West and South which continue to grow, or of some of the older suburban communities or "grey areas" located on the immediate periphery of the central cities that are receiving some of the "spillover" of populations from the high-density central ghettoes.

easier, and where the upper and middle classes fleeing the core areas are forming a ready labor and consumer market that exerts further pull on the wholesale and retail trade activities remaining in the center.

Some evidence of the magnitude of these changes taking place in the locations of new investment activity outside of central cities is presented in Table I and Appendix B.

[a] Data for groups of years are used to avoid erroneous impressions from erratic year-to-year movements in building construction.

1 Includes types not shown separately and excludes major additions and alterations for which type of building is not known.

2 Excludes data for 1959, for which comparable information is not available.

SOURCE: Unpublished data of the Bureau of the Census, tabulated at the request of the Bureau of Labor Statistics. Based on a sample of over 3,000 permit-issuing places.

The tables clearly point up the long-term tendency for major sources of manpower utilization to be located at a considerable distance from the residence of those workers now experiencing a high incidence of unemployment, subemployment and poverty. Fully three in five industrial structures are being built outside central cities. This dispersal of facilities to outlying areas presages and reflects the rapid growth of employment in the ring. For Chicago the suburban ring share of plant investment was 77 percent; it was 85 percent for Los Angeles. (See Appendix B). At the same time, the data reveal the importance of the central city as the services hub of the metropolis. Office buildings and community service activities continue to favor inner city locations by a sizeable margin over fringe locations. But these activities are prime sources of white-collar employment, for which a growing segment of the core city work force does not qualify. Moreover, there is evidence that central cities have been losing their edge in these activities, too, within the past 5 years.

Investment shifts are only an indirect indication of employment dispersal. More direct barometers are net percentage and mean absolute changes in employment between core cities and fringes over time. These were calculated for 40 SMSA's by John F. Kain, and results for selected years are presented in Table II.

In practically every category, suburban mean employment increased more rapidly than jobs in central cities, and with the exception of service employment — which rises steadily in good and bad times — total central city jobs dipped significantly during the 1958-63 period. Even when allowance is made for cyclical influences during the periods presented, suburban ring employment gain is a steadily rising multiple of that in central cities. While only incomplete data are available on changes in central city manufacturing employment during the period, they do suggest that the pattern is no different for the cities studied.

Differences in employment shifts between city and suburb are marked and consistently greater in the ring for practically all categories — manufacturing, wholesale and retail trades, and services. Department store sales as well as payroll employment have soared in the suburbs compared with the SMSA as a whole (and hence compared with the central city) for virtually all the metropolitan areas studied, from which data could be obtained (See Table III). These industries account for two-thrids of nonagricultural emplyoyment, and in 1964 better than 60 percent of all heads of families in central cities were in such occupations. Dorothy K. Newman reports that three-fifth of those unemployed 15 weeks or longer in early 1967 had been last employed in such occupations.

There is no doubt, then, that many job-needy centrally located residents could qualify for the new and expanding activities available in the suburban rings of metropolitan areas.

TABLE II

ESTIMATED MEAN ANNUAL ABSOLUTE AND PERCENTAGE CHANGES IN EMPLOYMENT FOR THE CENTRAL CITIES AND SUBURBAN RINGS OF 40 LARGE SMSA's
(simple, unweighted averages of individual city changes)

	Central City			Suburban Ring		
	1954-1958	1958-1963	% Change 1952-1963	1954-1958	1958-1963	% Change 1958-1963
Manufacturing	–2,990	N.A.	N.A.	2,120	N.A.	N.A.

Retailing	118	–985	–2.0	2,263	1,931	13.4
Services	1,011	–294	0.9	934	756	13.5

SOURCE: Bureau of the Census data in John F. Kain, "Distribution and Movement of Jobs and Industry," Discussion paper No. 8, MIT-Harvard Joint Center for Urban Studies, Nov. 1966, Tables 4 & 5 pp. 16, 19. N.A.=not available.

Manufacturing employment for New York City, for example, declined by more than 200,000, or 18% between 1953 and 1965, compared with a gain of 7 percent for its suburban counties and a 13 percent gain nationally.[5] Philadelphia and Chicago suffered losses of comparable dimensions, with more than offsetting gains for their urban fringes. Total employment within a 5-mile radius of downtown Boston fell by 29,000 between 1950 and 1960 but more than offsetting gains were made by its suburban ring. Between 1958 and 1965, manufacturing employment dropped by 7,000 in San Francisco, while it was gaining over 28,900 in the four Bay Area suburban counties, and wholesale trade lost 4,700 in the city while gaining 12,000 in the four suburban counties.[6] Similar patterns are repeated for practically all the large central cities (with the exception of Los Angeles) and, as Table III illustrates, for all central cites taken together.

More telling of the dimensions of employment shifts is the suburban ring's growing share af total SMSA employment. Table IV shows that the fringe proportion of total SMSA employment rose more than 37% for manufacturing and tripled its share for wholesaling.

TABLE III

PERCENT CHANGE IN PAYROLL EMPLOYMENT IN SELECTED SMSA's AND IN THEIR RINGS, BY INDUSTRY GROUP 1959-65[1]

1 Excludes government workers and the self-employed. Employment in the ring is estimated from employment outside of the county in which the central city is located. The central city and county were coterminous in both years in New Orleans, New York, Philadelphia, and Washington. For the following the ratio of the central city to central county employment in 1960 was 107 in San Francisco-Oakland, 89 in Boston, 70 in Indianapolis, 68 in Chicago, 64 in Detroit, 61 in Atlanta, 53 in Cleveland, and 52 in Dayton. Since the central county was used to establish the central city, the figures for the ring underestimate the suburban trend in all central cities which are smaller than the central city-county.

2 Excludes Los Angeles and St. Louis; for Los Angeles data for the central city-county do not permit close enough approximation with the city proper, and for St. Louis, data are not yet available for 1965.

3 Less than 0.5 percent change.

SUBURBAN RING SHARE OF SMSA EMPLOYMENT
BY SELECTED YEARS

	1948	1954	1958	1963
Manufacturing	36.5	41.1	45.6	50.3*
Wholesaling	9.5	16.3	23.4	31.5
Retailing	25.3	32.3	39.3	47.5
Services	17.4	24.5	29.5	35.2

SOURCES: Census data computed by John F. Kain, op.cit., Table 10, p. 38.

* Computed by author only for 22 large SMSA's.

Other data reveal that since 1948, the slowest growing central cities have been losing an average of 32,000 manufacturing jobs per year, to an average 15,000 jobs per year for central cities with medium and higher growth rates. Moreover, the trends within central cities indicate that employment tended to decline less for their downtown CBD's, and more sharply for their outer business rings, which frequently include the burgeoning slum population.

Thus by almost any index, central cities are losing employment to their peripheral areas, and indications are that this decentralizingtrend is accelerating. The problems posed by these structural changes in the urban labor market have enormous implications for manpower planning, utilization and development.

But the key point is that recent population and job dispersals have thrust upon the central city the enormous burden of accommodating the sweeping changes besetting urban life in America today. No one would seriously deny that the immediate problem of adjustment revolves around the employment status of disadvantaged youth and members of minority groups, primarily Negroes.

Only slowly is a metropolitan-area approach to urban planning beginning to emerge that might encompass considerations of manpower cost-benefit aspects of developing industrial parks and other employment generating activities relative to alternative land uses of city spatial scarcities. And judging from most of the Model Cities proposals reviewed by the author, there is virtually no recognition of the decentralizing trends in urban jobs and residential densities, or any understanding of the critical choices they pose for urban policy-making.

How to stem the rapid expansion of a concentrated ghetto population

of jobless on the one hand and the fanning out of employment sources beyond the city's administrative boundaries on the other? Urban authorities are confronted with several strategies to meet the adverse trends in jobs and migration. They include: (1) policies to re-concentrate workplaces inside central cities, or at least stem the tendencies toward employment dispersal, through increasing the comparative advantages of centrally located businesses and industries, (2) multiple policies geared to re-locate ghetto residents in the more bustling labor markets in the suburbs, stem ghetto concentrations in the inner city through a broad-scale attack on metrpolitan housing market segregation, promote development of public-supported housing in lower-density areas of the metropolitan complex, etc., (3) the development of a comprehensive mass transportation net efficiently linking all principal origin and destination points in the metropolitan area, or (4) some ordered or selective combination of these.

While these strategies are not necessarily conflicting, they do compete at many points, as this paper demonstrates in Section III, and therefore the need emerges to determine and slect a central guiding strategy around which other approaches might evolve. This master strategy, or combination of strategies, must articulate in a coherent way policies for coping with imbalances in the metropolitan labor market.

Essentially there are three ways by which urban manpower planning may affect changes in the metropolitan labor market: (1) by modifications in the demand for manpower, (2) upgrading and reclaiming the potential manpower supply, and (3) revamping and sharpening the organization and operation of the metropolitan labor market.

The above discussion has reviewed the dimension of urban job decentralization in the context of ghetto expansion in core areas. It would now be useful to examine the various modal responses of urban policy-makers in coping with underutilized manpower resources posed by the conflicting trends of widening ghetto concentrations and employment dispersal, and seconly to evaluate the adequacy of these strategic responses in terms of the dimensions of the problem.

SECTION III — INNER CITY RESPONSES TO MANPOWER PROBLEMS

1. Policies to Re-Concentrate Jobs and Boost Urban Manpower Demand

Urban policy-makers have responded in various ways to stem or reverse the outward redistribution of people and jobs that entails such adverse consequences for the urban tax base and municipal finance. Commercial and industrial renewal is the most direct attack on employment dispersal undertaken by cities. This program usually takes the form of attracting new industry or inducing firms inclined to decentralization to remain inside the cities' administrative boundaries. Most such measures aim at reducing the difficulty and cost of assembling larger tracts of unencumbered land, while other proposals seek to attrack and subsidize the location of plants within central city ghettoes. This is often considered desirable due to the high incidence of unemployment experienced by Negroes that is exacerbated by the steady movement of job opportunities away from accessibly located areas at the center.

While this paper makes no attempt to discuss these measures in detail, as a general observation it may be noted that the underlying rationale for facilitating land assembling and reform in land use policies are solidly grounded in evidence that inner cities could stand improvement in this area. Few central cities have made vigorous efforts at rationalizing the urban land market in tune with new trends and demands. Studies show that in most major central cities in the United States the share of land devoted to industrial-commercial (job-creating) purposes averages from 6 to 12 percent.[1] These cities are also ones experiencing expansions and new formations of slum neighborhoods. New York City, for example, is reported to zone little more than 5 percent of its land for industrial purposes, of which 635 acres are currently vacant.

At the same time, Mayor Lindsay has ordered a study of the possibilities of converting over 3,000 acres of publicly and privately owned land, now used for unneeded streets and junkyards, to industrial and residential purposes.[2] A survey by the New York City Department of Commerce, and other studies of manufacturers who relocated out of the city during 1965, showed that nearly 80 percent of the reasons advanced revolved around economic and legal problems in the development and use of city space, compared to less than 30 percent which gave taxes, and 5 percent labor problems as reasons.[3]

To meet this problem the city has set up a Public Development Corporation to take over city-owned land, develop it, and lease it to industry on

a long-term basis, as well as provide other services and assistance to attract and hold job-creating businesses.

New York City recently acquired title to the 185 acres of land of the now defunct Brooklyn Navy Shipyard which planners hope to convert into an industrial park. Their goal is to attract light industry into the area with a potential for high-density employment that could mean 36,000 new jobs for a neighborhood reported to experience unemployment exceeding 13 percent, half of which comprises Negroes and Puerto Ricans.[4]

Other major cities, notably Philadelphia, have undertaken similar measures, using provisions of the Community Renewal Program to promote the development of industrial parks and other sites conducive to employment-generating activity. However, there is as yet no solid evidence that these local efforts have made any discernable impact on the persistence and dimensions of out-migration and employment dispersal trends. Clearly, urban policy makers have not undertaken many local steps that could remove irritants and barriers to increased industry relocation and business activities.

Another proposal to spur lagging demand for urban manpower which has gained wider receptivity in recent years is that of inducing job-creating business activity to relocate in the Negro ghettoes. While proposals along these lines did not primarily originate with local authorities, they have been offered to meet the widespread demands for immediate corrective action of the pressing employment needs of slum residents. The Kennedy-Javits "Impact" legislation, the Comprehensive Employment Program (CEP) innaugurated in late 1966 by the White House, as well as HUD's Model Cities Program — are all attempts in part, to answer these needs. The U.S. Department of Labor has given its blessings and a $7 million contract for a comprehensive manpower program to provide jobs and training for 2,700 persons in the Bedford-Stuyvesant area of Brooklyn over the next two years. The programs seek to combine jobs with slum rehabilitation in the community under the Special Impact Programs established by the 1966 Kennedy-Javits amendment to the Economic Opportunity Act. Other features of the program aim at attracting some 25 business enterprises to the community to create 1,000 to 2,000 new jobs, and developing several hundred additional jobs in neighborhood construction and rehabilitation. The plans are designed to "cure the tendency toward chronic unemployment and rising community tensions," according to the announcement.[5]

Similar approaches at ghetto job creation to curtail "rising community tensions" are being undertaken in the Watts area of Los Angeles where Aerojet General Corporation established a subsidiary engaged mainly in

making items for the military. The firm started with 25 local residents and has expanded to over 200 employes, most of whom formerly consisted of the "hard-core" unemployed in the neighborhood.[6] The company was initially established to provide jobs and work-skill training for Watts residents and, given the physical isolation of the community from more distant workplaces in the Los Angeles area, it is small wonder that the firm boosts an employment application backlog of 2,200.

Since most of these efforts are relatively new, and just getting underway, it might be useful to note some of the chief reservations to locating additional industry into the central city and its slums.

The first consideration is that measures aimed at large-scale industrial renewal of inner cities are trying to buck powerful, and presumably healthy, national trends toward a more even spread of residences and workplaces throughout the metropolitan area. High density agglomeration of activities at the center, compounded by narrow streets, one-way traffic patterns and congestions of obsolescent structures conspire to undercut historic benefits from a central location. This is particularly applicable to the older central cities of the North where competition between high density workplaces and residences has been joined by the automobile, the expressway and other more recent competitors to the urban land market.

Decentralization, then, is thought to be desirable by some professional planners in order to reduce congestion and peak densities at the center, and that at any rate, not many more jobs, requiring relatively high ratios in square feet per worker, are likely to be "shoehorned" into the over-crowded big cities under modern land market conditions.

Moreover, it is pointed out that "realistic" cities which seek to maximize total revenue, will opt for the kinds of workplaces having higher paid employment — such as office buildings — with larger scope for vertical expansion. Policy would then be geared to attracting employers of white-collar and certain service industries, since these now account for nearly 3 out of 5 persons in the nonagricultural labor force, and are "a more stable and more regularly growing source of income than manufacturing."[7]

None of this is to condemn efforts at increasing the attraction of the inner city to business location, but rather to question the future of the city as a center for particular goods-producing industries.

If the scope for blue-collar and manufacturing employment in central cities is limited, then urban authorities are faced with the problem of absorbing a growing pool of underskilled manpower. While many cities are opting for white-collar employers, the disadvantaged and particularly Negro

employment gains have been seen to move in tandem with cyclical growth in manufacturing output and in industries employing sizeable numbers of common laborers. Thus if trends dictate a shifting of policy emphasis away from these sectors, local ghetto unemployment can be expected to remain at high levels, with all the attendant social dangers this situation entails.

Moreover, manufacturing industries are assumed to create wider external economies (i.e. bonus benfits that redound to outside industries and workers) and stronger multiplier effects than either white-collar or service industries.

Assessing ghetto job creation schemes is made difficult by the vagueness of many of the proposals advanced and the limited number of actual attempts and experiments. Even though ghetto areas suffer a high incidence of unemployment, and constitute a source of cheap labor supply, most industrial developers and businessmen apparently do not find it propitious to locate in them, and the turbulence now sweeping many central city slum areas only exacerbates such prospects.

Nevertheless, pressures to promote factory location in ghetto neighborhoods to relieve the severe employment problems have been increasing. A number of Model Cities proposals have taken up the idea. One metropolis, for example, has framed most of its job creation efforts in the manpower component of its application around programs for "selecting industries for the [Model Neighborhood] area which will meet the needs and requirements of the community." The proposal then proceeds to reduce the plausibility of the entire scheme by a burdensome criteria that require that "selected" industries be committed not only to employing and training large numbers of residents, but "must offer employment that can be quickly learned in . . . industries whose products can be identified with, and have a demand in, the local area." These specifications are exceeded by requirements that the firms selected to locate in the slum neighborhood "must offer satisfying futures to their employees" and "must be rewarding in terms of motivation, friendship, cultural and educational advancement, as well as monetary improvement." Such slippery realism calls to mind Charles Abrams' remark that "A nation's desire that industry settle where it is good for the nation is not always what the industrialist thinks is good for his business."[8]

Most other proposals reviewed by the author are somewhat more modest in their ghetto job creation schemes, usually sticking to the safer enterprises, such as day- and child-care centers employing indigenous mothers, and physical improvement activities to be carried out by local residents, none of which stand to offer more than a very limited scope for indigenous employment. Another point often missed in enthusiastic schemes for ghetto

job creation is that, carried out on a meaningful scale, such programs would exacerbate the already inadequate supply of low- and moderate-income housing. Truly effective industry development in slum areas would at some point entail large-scale land assembly. Since there are few contiguous vacancies and little unencumbered land in ghetto neighborhoods, problems would immediately arise in the process of demolition, land clearance, and displacing tenants whose standard housing needs the private market and public housing policies have failed to meet.

A yet more serious objection to ghetto job creation is that such programs might reduce pressures for residential open occupancy in metropolitan areas, and would tend to perpetuate and reinforce the ghetto, thus stultifying the drive against existing practices of segregation in housing markets and discrimination in the labor market. Prof. John F. Kain of Harvard notes that ghetto improvement and job creation schemes might have as their result a heightened migration of Southern Negroes, "greatly aggravating the already serious problems, while leaving the existing adverse levels of income and unemployment unchanged."[9]

Perhaps the toughest problem for urban policy in this area is determining criteria for encouraging the right "mix" of income-generating activities that maximizes local employment in all categories of available manpower while satisfying rising needs of municipal revenue. Each urban center, depending on its size, must tailor a development strategy to its economic setting. We have seen that cities of 50,000 to 500,000 in population are showing the largest potential for job growth. It would follow that public policy might better build around a growth strategy centered on reinforcing and sustaining this natural growth trend.

One facet of this policy would be diverting the future flow of rural migration to these growth centers. Another crucial facet must be aimed at dispersing and decentralizing the dangerous agglomeration of inner city ghettoes and their inhabitants more evenly over the suburban and outer ring growth centers of the metropolitan area. For this, however, a much larger measure of metropolitan coordination and Federal leadership, more resolute than any witnessed to date would be required, particularly in the field of open occupancy in housing markets, coordination of labor market policies and services, and comprehensive transportation planning better tailored to serve all groups in the metropolitan population.

Industrial renewal and ghetto job creation schemes for the larger metropolitan areas must in this strategy, therefore be seen as a means of easing the inner city through a painful transition period of adverse migration and employment trends. It would be a mistake to regard ghetto job creation as

offering more than a provisional and limited solution to the "rising community tensions" in urban poverty areas.

If central cities efforts to influence the demand for manpower have been uneven, limited and frequently irrelevant for the city's disadvantaged inhabitants, what has been the city's contribution on the supply side, i.e., on upgrading manpower resources? This question is examined below.

2. Policies for Upgrading Urban Manpower

It is now almost platitudinous to note that the Negro unemployment rate is double the rate for white workers, and that this inferior economic position cuts across every occupational class. It is also widely conceded that ghetto areas of central cities experience even higher rates. In March, 1967, United States Department of Labor released the results of a survey[10] on the characteristics of the labor force in slum areas that covered some 12 major cities for November 1966. The findings showed that traditionally defined unemployment rates (i.e., able-bodied persons "actively seeking work") of big city slums average three times the prevailing rate for the metropolitan labor market, of which the slum area is a part.

The survey also disclosed that: nearly 7 percent of those listed as employed are involuntary part-time workers (i.e., persons who would work full-time if such jobs were available). This figure compared with 2.3 percent nationally.

One in five full-time workers in slum areas earn less than $60 per week (the equivalent of the $3,000 poverty figure on an annual basis) compared with 15.4 percent nationally; medium family income was about $3,800 ($6,300 nationally), with over 37 percent reporting less than $3,000 annually.

The nonparticipation rate of men 20-64 "not in the labor force" in these areas exceeded 11 percent as against 7 percent nationally. This figure is, in part, a measure of the number of "discouraged workers" and suggests an ominous trend. For example, in 1948 barely 5 percent of Negro males in these ages were not "actively seeking work"; since 1958, however, this rate has hovered between 8% to 10% on a national basis. Thus the contraction of economic opportunities for Negroes since 1953 has probably resulted in increasing labor market withdrawal and apathetic idleness.

In March, 1966 Negro men were two-thirds of all nonparticipants in poverty areas of major cities;[11] the slum survey also discovered that from one-fifth to a third of adult men expected by other statistical sources to be part of the slum population, were "unfound."This was apparently consistent

with the "undercount" factor in the 1960 Census data, although more precise estimates of this statistic are now underway.

From the aggregation of these indices a "sub-employment" index was constructed by the Labor Department, consisting of a composite weight for each of these labor force characteristics for each slum area.

The principal reasons offered by the slum area respondents themselves for their subemployment status were lack of education and skills (44%), no jobs available (17%) or health deficiencies (6.2%).

Poverty-area dwellers, especially Negroes, according to other data, were concentrated in the least secure, least desirable and least rewarding jobs, with three out of four ghetto Negroes employed as low-paid, semi-skilled factory workers or operatives (25%), and lower-skilled laborers and service workers (50%).[12] It is frequently noted that these are the very occupational categories that have been diminishing in significance and in relative size as the nature of the economy changes. Even Negro males who held jobs in higher level occupations tended to be concentrated in seasonal industries (e.g. construction) or in the lower-skill levels of the occupation group.

Most of the unemployed slum population in particular cities did not appear to match the job vacancies that did exist, as was illustrated by data for the city of Philadephia:

	Slum unemployed	City-wide Vacancies
White collar jobs	15%	38%
Craftsmen	3%	23%
Operatives	11%	21%
Laborers	26%	5%
Service jobs	23%	13%
Never worked	22%	.....
	100%	100%

The report noted that "there were only 877 vacancies in the entire Philadelphia labor area for laborers, where there are 799 unemployed laborers in the slum area alone. There were 1,660 white collar and 1,300 sales vacancies, and only 442 slum unemployed with white-collar backgrounds."

Yet these figures raise more questions than they answer regarding urban manpower imbalances. They seem to describe more than explain the specific disparities between vacancies and the unemployed. There is no explanation, for example, why unemployed laborers should be so numerous,

even though total vacancies exceed this figure by nearly 10%. Nor why should 442 white-collar persons remain jobless side by side with 1,660 white-collar vacancies.

Quite apart from technical problems in data comparability, we can safely surmise that much of the disparity is due in no small measure to access problems, gaps in job market information, discriminatory hiring practices, or some variant of "shape-up" hiring, whereby non-white applicants are considered after other applications have been processed.

The urban labor market for the disadvantaged youth population presents an equally disturbing picture. Even in relatively good times, such as November, 1966, when the national unemployment rate was 3.7 percent, Negro teenage unemployment ranged from 27 to 35 percent. For slum areas of the major cities, teenage unemployment (14-19 year old) ranged from 18 percent in Washington, D.C. to 36 percent in Philadelphia, with the rate running above 30 percent in seven other areas.

In the preceding section it was noted that the Negro teenage population in cities rose 50 percent between 1960 and 1965, more than double the rise for the teenage population nationally. This unprecedented growth in the number of youth in larger urban areas is a potential source of social turbulence and unrest, and the present joblessness many of them now suffer, coupled with uninspiring future prospects, stand as a formidable challenge to urban public policy. Moreover, a special tabulation of data for poverty and non-poverty tracts in large metropolitan areas disclosed that as far as joblessness among Negro teenagers is concerned, it makes no difference whether or not they live in ghettoes. For them the male unemployment rate held at 31 percent **in** or **out** of the slum areas, contrasted with a 20 percent rate for white teenagers in the slum areas, which fell to 12 percent outside of slum areas.[14]

This situation of unrelieved bleakness for disadvantaged youth in urban areas, despite a number of expanded programs in the youth-work field, has led to a new and portentous mood in ghetto areas. As one press source reported:

> A group coordinating local open housing organizations said today there is a growing conviction among young Negroes that further civil rights progress will be gained only through social turbulence . . . reported . . . the National Committee Against Discrimination in Housing. 'Negroes, in their own words, don't want the plantation fixed up . . . They want massive clearance of slum housing, new construction as well as rehabilitation, and full access to new and improved dwellings in all sections of metropolitan areas.'[14]

There is increasing evidence, too, that the dual forces of technological change and metropolitan employment shifts are posing serious problems for new entrants to inner city labor market. Reviewing data concerning labor force attachment, in 1953 — perhaps the last time that the American economy really approached full employment — those with no previous work experience comprised only 4.4 percent of the total unemployed. By 1958, this figure had risen to 9.3 percent, and since 1963 it has ranged between 14.8 and 16 percent of the jobless.

The gravity of this problem can be seen from BLS projections which show a faster relative growth for the non-white labor force. By 1970, the non-white labor force will have risen by 31 percent over 1960 compared with 22 percent for the total labor force. By 1980 the Negro labor force will have risen by 41 percent over 1960 as against 26 percent for the total labor force.[15] Hence new entrants to the work force can be expected to be a rising proportion of the Negro unemployed unless job opportunities expand at a much faster pace.

How many new jobs will be needed to absorb those who now suffer the burdens of subemployment? One study estimates that:[16]

—260,000 additional jobs would be required to reduce the unemployment rates in slum areas to the level prevailing in nonpoverty metropolitan areas.

—another 90,000 jobs would be required to equate Negro unemployment rates to that of whites outside of slum areas.

—100,000 more jobs would be needed to provide full-time work for those persons employed part-time for economic reasons.

—an added 175,000 jobs would be necessary to employ men in the 25 to 64 age group who have withdrawn in despair from the labor force. These total only 600,000 full-time steady jobs required. But to this conservative estimate must be added the millions of urban workers in low-paid industries and occupations employed full-time but earning less than the $60 per week poverty benchmark plus the number of able-bodied adult men, mainly Negroes, missed in the 1960 Census count.

This number is impossible to measure accurately, but probably another 5 million jobs, including an estimate based on additional above-poverty-rated equivalent hours, would be needed to bring down "real" unemployment (i.e., unemployment that exceeds the official definition) in ghetto areas to that prevailing for the particular metropolitan labor market area.

It is clear that such a big order is quite beyond the purview of even the

most dedicated policy-makers at the metropolitan level. Therefore, the national government, through aggressive tax and fiscal measures, will be obliged to generate a climate of full employment sufficient to begin absorbing the potential manpower surplus damned up in the nation's ghetto areas.

Full Employment Policies and Ghetto Unemployment

Citing the array of "personal" deficiencies that characterizes potential workers in slum areas (e.g. high incidence of welfare claimants, crime, low-education and motivation, etc.) the Labor Department's slum survey concludes that "No conceivable increase in the gross national product would stir these backwaters. The problem is less one of inadequate opportunity than of inability, under existing conditions, to use opportunity." Elsewhere, however, the report concedes that "There shows up in these surveys more signs of continuing racial discrimination than it was expected would be found," and again: "Important as these 'personal' factors are . . . it is nevertheless clear that the slum unemployment situation is strongly affected by 'job market' circumstances."

Moreover, the report's assertion that ghetto unemployment is inelastic relative to GNP conflicts with other empirical findings of economic research. One study, for example, by Lester C. Thurow, using multiple regression techniques to trace key poverty generating variables, shows essentially that Negro employment and family income were highly elastic (i.e. sensitive) with respect to changes in aggregate demand, with non-white elasticities estimated to be more than double that of whites. (Calculated elasticities were 2.24 for Negroes vs. 1.21 for whites). This meant that Negro employment and income gain relative to whites in periods of expansion, and decline relative to whites in recessions. Thurow notes that:

> During every recession in the post-war period, the ratio of Negro to white incomes dropped sharply. With improving employment opportunities in 1964 Negro incomes rose from 53 to 56 percent of white incomes, but were still below [the] 1952 levels. This phenomenon occured in both 1958 and 1961 . . . Between 1947 and 1952, median Negro family income rose from 51 to 57 percent of median white family income, but by 1958 all of the gains were lost and Negro incomes were back to 51 percent. With high unemployment and few job opportunities, Negro incomes fell behind those of whites.[17]

Another study by Einar Hardin, employing multiple regression techniques to establish relationships between full employment and the utilization of workers with different levels of educational attainment, concludes that " . . . disparities in unemployment rates among persons with unequal levels of education diminished as the national rate of unemployment de-

clined."[18] In short, sustained full employment policies tended to reduce unemployment rates for less educated workers (such as ghetto Negroes) faster than rates for higher educated workers. The results also failed to find that alleged shortages among higher educated workers in periods of expansion are a significant explanatory element in inflationary pressures.

Stanley Sadofsky, Director of the Center for the Study of Unemployed Youth, New York University, stated before the House Committee on Education and Labor, that

> It is our present national economic policy to accept an unemployment rate of four percent rather than to pursue the expansionary steps necessary to drive the unemployment rate to three percent or less . . . The effect of the change, we believe, is to lock hundreds of thousands of productive disadvantaged people into depressed conditions of unemployment and underemployment. The difference between a four percent and a three percent unemployment rate is approximately 750,000 more unemployed persons.[19]

It would thus be a costly error if Federal policy abandons commitment to expansionary measures to spur inroads into ghetto unemployment. For without national growth and a heightened expansion of employment opportunities, no fundamental solutions are likely to be achieved, least of all by *powerless and isolated policy-makers at the metropolitan level.*

Local Policies for Upgrading Urban Manpower

However, other measures for upgrading urban manpower resources are more within the ambit of local authority: one is using the local civil service and other municipal arms to undertake large-scale, in-service and on-the-job training for unemployed youth and able-bodied ghetto men, both in and out of the traditionally defined labor force.

Stronger emphasis on preventive care medical services delivered by means of mobile clinics, as well as the promotion of lare-scale ghetto day care institutions charging nominal fees and employing indigenous workers, would serve to renew the contact of many "non-participants" as well as hard-core unemployed with the labor market.

While neither of these measures is considered particularly sweeping or revolutionary, significantly few of the Model Cities proposals reviewed by the author committed city applicants to efforts at revamping their local civil service systems to the goal of in-service training and employment of more ghetto residents, although practically all applications placed heavy emphasis on the establishment and expansion of day-care centers in slum neighborhoods.

With one-half to three-fourth of metropolitan-area youth who graduate from high schools directly entering the labor market, it is one of the crowning ironies of American education that so little emphasis, investment and talent have been directed to reform and expansion in the system of vocational education. A national study[20] of vocational education in a number of communities resulted in the findings that the system, in terms of the adequacy of curriculum content, administration, advisory committee, and in many other areas, is in urgent need of reorganization and stronger support, particularly from local educational boards — which were often found to be out of touch and sympathy with vocational education needs and goals. Moreover, Federal grants-in-aid for state vocational education programs go back to 1917 and have altered little since then. Private vocational education programs, on the other hand, which receive no federal help, all but monopolize the teaching of construction trades and office clerical occupations, where there is a large turnover of jobs annually.[21]

These private sponsors are reported to lobby vigorously against heavier public investment in expanding vocational education in tune with modern labor market demands. Clearly, much of the federal investment now going to institutional and skills training by community agencies, might better be allocated to an all-around improvement in aspects of vocational education, which could more effectively enlarge the adaptability and mobility of youth to the modern labor market.

Vocational education and training in modern skills may be too serious a business to be left to the benign lights of traditional-minded and sometimes hidebound local education boards. The entire system might be improved through contractual takeover by local resourceful universities, which can more readily be relied on to keep curricular tools and standards abreast with modern technical trends. This course incidentally could also liberate local vocational education from the dead hand exercised by proprietary trade union interests, which dominate advisory committees by overseeing the conduct of training for the craft occupations.

3. Strategies and Barriers In Improving the Functioning of the Urban Labor Market

There are essentially three levers for influencing and improving the organization and working of the urban labor market. One is through the lever of information and communication. A second is through improved means of transportation and access, and a third is through the eradication of social and institutional barriers to the free and rational allocation of manpower demand and supply forces within the metropolitan labor market.

Job Market Information in Metropolitan Areas

Urban labor markets, embracing core cities and their urban fringes, have become very complex mechanisms. In contrast to the more informal patterns that characterize small towns and rural areas, metropolitan labor markets are highly intricate, and more formal and limited regarding points of access to specific job opportunities. This situation magnifies the problem of making a rational occupational choice. Only a limited amount of data is disseminated on the present availability of jobs, up-to-date information on hiring standards and job seeking techniques of different workers. For example, a study on comparative job-seeking patterns of whites and Negroes by Melvin Lurie and Elton Rayack[22] revealed that, while both groups relied predominantly on informal methods of search, such as leads through relatives, friends, etc., Negroes depended nearly four times as much on state employment services than did whites. Conversely, white workers relied as heavily on private employment agencies which were generally shunned by Negroes. New in-migrants of either group, but particularly Negroes, also fared poorly in their job search relative to established urban residents.

Standard communications media, such as newspapers, T.V., etc. fail to reach out sufficiently into ghetto areas of the metropolitan complex. In-migrants, particularly those recently arrived from rural areas, are doubly handicapped in their job search and in knowledge of jobs and services available to them. One report from Cleveland of recent migrants disclosed that few are aware of existing training opportunities, and that "almost none have ever been contacted by social workers or others in a position to appraise their experience, abilities and needs and to direct them toward appropriate service agencies. Yet both white and Negro migrants have been unanimous in expressing a desire for occupational training."[23]

Job-seeking patterns of 450 disadvantaged youth in Philadelphia were also reported in 1966, which documented the narrowness of the job search among the unskilled and disadvantaged. Chief among the findings were that many youth had never made a single contact with an employer (41%), and only one in five had made as many as one such contact per week. The longer their period of unemployment, the less effort they made to find work. Most youth restricted their search to a few occupations and industries, preferring to stay as close to home as possible. The report noted:

> Some youth felt that the chances of securing a job were better since the prospective employer 'might know' them and would be more apt to hire them. Several boys said they were afraid to travel through territories of other gangs. Several others 'did not know their way around the city' and said they thought they might get lost.[24]

Many adult workers, particularly Negroes, fearing rebuff from discriminatory hiring practices (e.g., race, age, etc.), similarly narrow their job search to a few occupations and industries.

The results of these studies are consistent with previous labor market surveys that point to the ineffectiveness of traditional channels of job market information. Studies have long confirmed that most blue-collar work seekers prefer the informal methods of consultation with friends, relatives or through direct application at personnel offices, etc. This means that in ghetto areas, where many of the neighbors and relatives themselves are jobless, and where potential employment sources have now fanned out over a vast area remote from the job-seekers place of residence, such informal techniques are likely to prove most unproductive, since many of the jobs that are available can only be identified through information channels that are not readily available in the central city.

Barriers in a "Dual" Labor Market

Marked differences in job hunting, information availability, and physical access to the growing volume of job opportunities in suburban areas have suggested the existence to some observers[25] of a dual labor market in metropolitan areas. This analysis traces the American tolerance of unemployment rates above those accepted in Europe to the surplus labor pool served by the ghetto labor force:

> In more specific terms, a racially dual labor market means that there exists a primary metropolitan labor market in which firms recruit white workers and in which white workers look for jobs; side by side with the major market, there exists a smaller labor sector in which Negroes are recruited and in which Negroes look for employment. For each sector there are separate demand and supply forces determining the allocation of jobs to workers and workers to jobs. Over time, this dualism is characterized by a transfer of jobs from the white sector to the Negro sector as the economy develops and as the Negro labor force expands in absolute and relative numbers.

Hints that urban firms "shop" in suburban markets for white labor, and in inner city markets for ghetto labor are suggested by a recent Labor Department complaint that a State Employment Service office in a virtually all white suburb of Cleveland received and processed job orders from inner city firms, instead of promptly referring such orders back to centrally located offices in Cleveland.[26] It is difficult to determine how widespread this practice of "shopping" for workers in localities inaccessible to ghetto residents may be by some employers. To gain a measure of "duality" in urban labor markets, central cities, in cooperation with suburban communities, could

invest greater efforts into a more sophisticated system of collection, analysis, dissemination and exchange of pertinent labor market information.

Official federal data collection agencies draw their samples and analyze results on the basis of 150 "labor market areas" of the country, as defined by the Bureau of Labor Statistics. With few exceptions these areas coincide with the Budget Bureau's SMSAs, which cover a commuting orbit sufficiently large that localized pockets of manpower imbalances are fig-leafed and evened out in the results collected for the area as a whole. The Labor Department's slum survey noted that the employment situation in these areas . . . is so much worse than it is in the country as a whole that the national measurements of unemployment are irrelevant."

But the misleading picture presented in the national measurements is shared by the reporting systems for the metropolitan labor areas. Table I presents something of the magnitude of the discrepancy between employment conditions in large metropolitan labor areas and in their inner city ghettoes. In no ghetto area is unemployment less than double the rate for the labor area as a whole. The range is from multiples of 2.1 for the Boston area to 4.3 for St. Louis, with sub-employment rates in slum neighborhoods approaching disaster levels.

Hence time series of labor market data that provide special and separate reporting for the "depressed" sub-areas must become a regular feature of the information flow. Since most of the larger cities already have labor departments, this aim could probably be attained by urban authorities arranging broader sub-contractual arrangements with local offices of the Employment Service and regional offices of the Bureau of Labor Statistics.

The information resulting from a more intensive stratified coverage should be accompanied by intensive counseling of new entrants and reentrants to the labor market and of those who are forced to acquire a new occupational orientation. Finally, computer techniques for securing comprehensive information about the concentration and dispersal of job vacancies within the commuting orbit should augment the improved regular data series. This latter task, of course, will have to be undertaken jointly with federal, municipal, and private agencies which can enlist the support and cooperation of a substantial number of employers.

Urban Commuting Problems and Accessibility to Work

Improved channels of information by themselves do not eradicate the hang-ups in the metropolitan labor market. The spread of workplaces around the central city's perimeter has made accessibility to suburban em-

TABLE I

UNEMPLOYMENT RATES BY MAJOR LABOR MARKET AREAS AND CENTRAL CITY GHETTOES, FOR NOVEMBER, 1966

	Labor Area Rate(1)	Ghetto Rate(2)	Ghetto Sub-employment Rate(2)
Boston	3.3	6.9	24.2
Cleveland	3.1	15.6	N. A.
Detroit	2.6	10.1	N. A.
Los Angeles	4.2	12.0	N. A.
New Orleans	3.3	10.0	45.3
New York City	4.0	.....	.....
Central Harlem	.....	8.1	28.6
East Harlem	.....	9.0	33.1
Bedford-Stuyvesant	.....	6.2	27.6
Oakland	4.5*	13.0	N. A.
Philadelphia	2.8	11.0	34.2
Phoenix	3.1	13.2	41.7
St. Louis	2.9	12.9	38.9
San Antonio	4.2	8.1	47.4
San Francisco	4.5*	11.1	24.6

* Labor area data combined for San Francisco and Oakland N.A. — not available.

ployment particularly formidable for the ghetto's disadvantaged — both white and Negro — who occupy the older residential sections that usually girdle the downtown business districts.

Earlier generations of workers from these slums were usually able to walk to the local factory or take a short bus or trolley ride to their centrally located workplaces. However, the exodus of industry and commerce to the urban fringe has severely weakened the physical nexus between the job-seekers place of residence and his prospective source of employment. This development also contributes to the ineffectiveness of the informal job-seeking patterns of most blue collar workers discussed above.

At the same time, inner cities, in tandem with national trends, are in-

creasingly the preponderant sources of white-collar employment. As was shown in Section II above, central cities still corral nearly three-fourth of all investment in construction of office buildings, in contrast to their minority share in construction of industrial and commercial facilities. The Regional Plan Association of New York, for example, reports that 60 percent of all white-collar employment for the enlarged New York Metropolitan Area (including the five New York City counties, and 17 suburban counties in New York, Northern New Jersey and Connecticut) is concentrated in Manhattan's central business district between 61st Street and the island's southern tip.

Thus in recent years, as many urban authorities have observed, office buildings have been springing up in central cities that will largely employ suburban ring residents who have to commute to work, while industrial plants, major sources of lower-skill employment, are increasingly concentrated in suburban areas where the bulk of disadvantaged workers, particularly Negroes, do not live.

Getting to a suburban job therefore becomes a costly and arduous undertaking for ghetto workers. Quite apart from the fact that operating schedules of public transportation facilities are poorly adapted to linking rush-hour commuters from core areas with outlying workplaces ("reverse commuting"), substantial evidence by Meyer, Kain and Wohl reveals that inner city residents are obliged to spend more money and time to reach suburban employment than suburban workers commuting to the city.[27]

Los Angeles authorities, for example, estimate that a resident of Green Meadows South (a ghetto area of South Los Angeles) commuting to a workplace in the City of Commerce would spend $57, travel 924 miles, and spend 77 hours each month. According to estimates by the New York City Traffic Commission, it would cost a Central Harlem worker $40 a month to commute by public transportation to work in an aircraft plant in Farmingdale, Long Island, or to a plant in Yonkers, or to a job in Staten Island. The public transit cost for a Bedford-Stuyvesant worker to the same places would amount to nearly $50 a month.[28]

Similar transit difficulties exist in other large urban centers. Ghetto areas of West Side Chicago are reported to have a lower rate of automobile usage for commuting to jobs than any other area of the city.[29] This finding supports data from the 1960 Census that showed fewer than half of all nonwhite families in central cities owning an automobile, for 8 of the 14 cities surveyed.[30] Only in 6 cities, all located in the Midwest and West where Negro median family income is highest, was automobile ownership above 50 percent.

Nevertheless, inner city residents in general, and ghetto residents in particular, are known to rely most on public transportation. Yet these travel difficulties add not only to the burden of seeking work, as was noted above, but also to the cost of working. Under the impact of higher public transit fares in urban areas over the past year, the Consumer Price Index for public transportation costs has climbed from 121.4 in December 1965 (1957-59 = 100) to 130.6 for April 1967, a rise that led every other component in the index save medical care.

These developments have prompted economist Arnold R. Weber to note:

> In the past, commuting to work was associated with corporate presidents and bankers. As part of our continued progress in democracy, commuting is now a privilege extended equally to domestic servants and janitors . . . Thus a new class has emerged in the urban labor market. Its members are separated from the mainstream of economic activity by deficiencies in skill and education, pronounced gaps in the labor market information system, and increased physical distance.[31]

The seriousness with which the national government views the problem of low-income workers' accessibility to jobs located at inconvenient and costly distances from their residences, is revealed by the Department of Housing and Urban Development's (HUD) awarding of demonstration grants to local agencies to expand existing, or develop new, mass transit facilities serving low-income neighborhoods.

New York State has received a $2 million grant to provide low income residents of Nassau and Suffolk Counties direct access to job opportunities that can now be reached only by car or by circuitous bus routes, involving for most persons multiple transfers and several hours.[32] The McCone Commission's report on Watts, for example, attributed much of the unemployment and desparate isolation of that ghetto to what "may well be the least adequate network of public transportation in America." Accordingly, HUD approved in early 1966 a $2.7 million demonstration research project in Watts to study the relationship between public transportation and job opportunities for low-income groups.

Similar demonstration projects have been awarded in other cities, notably: Chesapeake, Virginia, where a HUD grant has established service between the town's residential areas and employment opportunities in the industrial areas of Norfolk; and in Rome, New York, to help set up a transportation system where 2,000 households do not have automobiles and 10 percent of the eligible workers are jobless.[33]

Practically all of the programs aimed at expanding job opportunities for

the poor in urban areas have been demonstration projects in which HUD finances experiments that localities themselves would not otherwise be induced to undertake. The grants are authorized under the Urban Mass Transit Act of 1964, as amended, with $150 million allotted to capital improvement and demonstrations for fiscal 1968 and 1969.

Thus the disadvantaged job seeker's problem of accessibility to work, generated by changes in spatial organization and the dispersal of human activities, has become a central concern in national plans for urban rejuvenation.

Since the proportion of commuters using public transportation has been declining steadily since 1948, as the expressway has made the private automobile a more desirable choice, transit companies in most localities have curtailed or abandoned services for many sections of the city. All the signs point to a continuation of this trend, except for the high-density residential and workplace areas. Component "D" (Public Facilities) of the Model Cities Guidelines is designed in part to assist localities in shaping a public transportation system for easing "access between residential areas and centers of employment."

There is, however, scant evidence that the goal of easier access between home and work will be furthered by transportation programs in proposals we have reviewed. Most localities, while routinely stating this as their goal, committed themselves to little more than "surveys" and "studies" of the use of public transportation by Model Neighborhood residents.

One Midwestern city explained that there was little it could do to influence improvements in public transit service to its target area, because the local transit company was privately-owned. The locality did promise to seek the "cooperation" of the company, but failed to note about what. At the same time, this applicant city is applying for a transportation research and demonstration grant from HUD, even though the proposal, in another place noted that access to workplaces and to other facilities is not a serious problem.

One large city where access to employment and services has been a well-known problem for ghetto residents, is convinced that its efforts to develop jobs and new industries in the target neighborhood area will obviate the need to seek more radical improvements in existing transit services, since the builk of workers "will be able to walk to work."

One curious feature in this city's Model scheme is that it plans to develop most industries and jobs in the southwest part of the target area where a railroad yard is situated, and which is bordered by two expressways.

The plan argues that these facilities enhance the area to industry. Yet there is no southwest access to either of the freeways that physically isolate this target ghetto area. The lone access, leading to only one expressway, is located in the northern part more than 15 blocks away.

It would not be useful to further elaborate the relative merits of this component in other proposals reviewed. Our interest in this, as other features of the Model Cities Program, is in the impact of mass transit deficiencies on ghetto employment difficulties and labor mobility **within** the metrolopitan area.

While we have demonstrated this to be a serious problem, it is important to consider the evidence which suggests that housing segregation and Negro ghettoes are complicating factors. Prof. John Kain observes that the urban transportation "problem" would lose much of its complexity in the absence of metropolitan housing market segregation, which creates the need for several independent but overlapping transit systems:[34]

> "A system is needed to transport central city white captive' transit users (low-income, childless and elderly white households) between high-density origins and other destinations.
>
> "An entirely different transit system is needed for ghetto Negroes. Since they are much less able to change their places of residence, this second system must be (1) largely confined to the ghetto, (2) very indirect and thereby slow . . . or (3) very extensive, expensive and heavily subsidized (if it is to provide reasonably direct and fast service to the rest of the metropolitan area). . . .
>
> "Finally, a third system is needed to transport centrally employed whites through the steadily expanding ghettoes to white garrison suburbs. Since the distances between home and work are so great and steadily growing, the white commuter system must be high performance . . . and subsidized."

These strictures notwithstanding, some cities are moving ahead wtih further ghettoization of mass transit planning. In Washington, D. C., for example, the Metropolitan Area Transit Authority (MATA) has current plans for the Districts' proposed subway that are expected to by-pass Negro ghetto areas of Anacostia and Cardozo in a city nearly two-thirds non-white. A report notes:[35]

> The basic Washington system also calls for building subway lines out mostly white, middle-class Connecticut Avenue, and out the Baltimore and Ohio right-of-way through Northeast Washington. There are no immediate plans to serve Cardozo or the Shaw urban renewal area of Anacostia.
>
> In the Shaw area especially, the Rev. Walter F. Fauntroy has voiced doubt that urban renewal could be planned for his neighborhood without the benefit of transportation planning as well.

HUD Secretary Weaver recently objected to the widespread practice of planning mass transit facilities that ignore the needs of the poor. The Secretary emphasized:[36]

> . . . developing a balanced national transportation system that does not permit the isolation of neighborhoods to occur or continue to re-occur . . . It is a question very much alive at this moment in a number of places where the decision must be made soon on where the first subway line will run . . . Will it be out one street through middle- and upper-class neighborhoods, or out another street just a few blocks away, through low-income neighborhoods?

Most of these citations reinforce the suggestion that racial barriers behind residential patterns severly complicate the problem of job access for the ghetto population.

Admittedly, the evidence is as yet too tenuous and impressionistic to support sweeping generalizations regarding the decisiveness of social barriers to ghetto labor mobility and employment. And as with all other urban problems, the multiple causes of imbalance in metropolitan labor markets are complex and interrelated. However, it would be foolish as well as dishonest to deny that barriers to open housing for non-white families in the urban fringes of core cities constitute, among other things, a formidable impediment to employment and work accessibility.

Social Barriers: Housing Market Segregation and Employment

If the deficiencies elaborated above in urban public transportation constitute a formidable long-term hindrance to job accessibility and employment welfare for any group of workers, the logical deduction is that they should simply move as close to their jobs as their housing dollars permit.

An important condition in economic theory for the successful functioning of a market economy is the free mobility of productive factors, particularly labor. And the labor statistics that are available confirm that American workers retain a remarkably high degree of occupational, employer, and residential mobility.[37] Yet for a large segment of the potential work force in central cities, this presumed mobility and easier job access are non-existent. A former director of the Economic Development Administration explained before the Ribicoff subcommittee hearings on urban affairs that

> In theory, of course, the blue collar workers in these needy urban areas should have followed the blue-collar jobs out of the city. But in practice this has not happened, and there is no indication that it is about to happen. The blue-collar workers in these areas either do not have the motivation . . . to move . . . or [lack] the money to move, or some may be barred by discrimination from living near their jobs outside of the city.[38]

Kain has established an empirical relationship between housing market segregation and the level and distribution of Negro ghetto employment.[39] His findings show the occupational and geographical distribution, as well as the level, of Negro ghetto employment to be highly affected by the racial composition of the workplace neighborhood, and the physical distances separating Negro ghetto areas from workulace locations.

The problem cannot be so easily dismissed by referring simply to the dearth of low-cost housing in suburban areas for white as well as black workers. For one thing, the trek from the inner cities to the suburban rings in America has been as much a lower-middle class phenomenon as an upper-middle class one, and it is necessary to add that differences in median family income between Negroes and whites is not a significant explanatory reason for the observed segregation in housing.[40] Kain makes a related point:[41]

> Low-income white workers adapt their residential choices to their job locations and to available transit services. When their jobs are in suburban areas, an increasing trend, they invariably live in suburban areas. When Negro jobs are located in suburban areas, they must either be foregone or they represent difficult, costly, and time-consuming trips from central residence areas to suburban work places.

He also notes how segregated housing distorts both the market for jobs and housing:[42]

> . . . employment dispersal provided strong incentives for many whites to move to suburban residence areas nearby their new workplace locations . . . But the jobs of many whites remained in central cities, and these individuals often would have reduced their combined housing and travel outlays by not moving. Moreover, many Negro jobs also shifted to suburban locations; others were located there all the while; and if Negroes had free access to suburban housing markets, both the number of Negroes employed in suburbs and the number of whites employed in central cities would be larger.

Kain calculates that housing exclusion in suburban residence areas may cost Detroit Negroes an estimated 9,000 jobs and Chicago Negroes upwards of 30,000 jobs, based on 1952 and 1956 data.

Although recent data to buttress some of these observations are elusive, there are disturbing hints that this problem is worsening. A JOBS Project in Chicago was awarded a labor mobility demonstration grant from the Labor Department authorized under sections 208 and 306 of MDTA, as amended, to test the feasibility of federal programs relocating jobless Negro men from the city's slum areas to available jobs in the increasingly industrialized suburban towns on the fringes. The goal of the project was to relocate not

more than 75 persons, but instead it failed to transplant even 10 percent of that number due mainly to suburban opposition to housing integration as the account noted:[43]

> Though the project's files bulge with job offers from suburban employers, a double-edged resistance to transplanting the Negroes has largely stymied attempts at relocation. The reactions from white-dominated suburbs where housing for Negroes is difficult or impossible to find, range from cool to hostile.

The report also noted the reluctance of many of the job-seekers to consider relocating from ghetto residences to suburban environments. But whether this can be attributed to "low" motivation or to affinity for familiar surroundings, or to other factors, they cannot be properly assessed without relation to the distorting consequences of traditional social housing patterns.

The objective of the mobility project just described was to uncover the chief "mechanical and operational" barriers to relocating unemployed slum dwellers to residences with heightened accessibility to employment. Instead, the principal impediment in this instance was found to be neither operational nor mechanical and one whose dynamics rarely yield to such approaches.

When several large employers announced in late 1966 decisions to shift their corporate headquarters out of New York City to more spacious sites offered in suburban counties, the Westchester County executive explained in effect that, while the county welcomed "white collar" employers, the zoning law and housing market made it undesirable to accomodate large users of blue collar labor.[44] Residential zoning restrictions have long been recognized as an additional safeguard of suburbia against "invasion" by the economically and socially disadvantaged. "Zoning is something our forefathers would never have believed possible . . . These laws to keep the peasants out are putting out the flame under America's melting pot," complained a Connecticut General Assemblyman as he introduced a bill to curb the use of such laws.[45]

Newer developments, as well, have suffered from the inclination by the planners to preserve the class integrity of burgeoning communities.* In early 1967 the Department of Housing and Urban Development awarded a study grant to the "New Town" of Reston, Virginia to plan how low-income families might be integrated into the community, which critics charged had

* For documentation on the existence and extent of residential segregation in American cities see: Karl E. and Alma F. Taeuber, **Negroes in Cities**, (Chicago: Aldine Publishing Co., 1965); George and Eunice Grier, **Equality and Beyond: Housing Segregation and the Goals of the Great Society** (New York: Anti-Defamation League of B'nai B'rith, 1966); Harry Sharp and Leo F. Schnore, "Changing Color Composition of Metropolitan Areas," **Land Economics**, May 1962.

been planned only for middle and upper-income groups. In announcing the grant, Housing Secretary Weaver noted:[46]

> Much of today's new town planning is predicated upon occupancy by a single economic or social group, generally the managerial class. Yet the new industries springing up in the suburban areas are having trouble finding workers with lesser skills, who live in the inner city because they cannot find housing close to the job openings. They find it too costly to travel to and from work."

This widespread disposition to freeze community physical and social patterns doubtlessly contribute to the virtually unchanging proportion of Negroes living outside central cities, as illustrated in Table II and the chart below. In five of the twelve largest SMSAs, for example, the percentage of Negroes residing in suburban areas actually declined between 1950 and 1960, and in no area did the proportion exceed seven percent. This situation can be contrasted to the mushroom growth of nonwhites in central cities, which rose by an average of 12 percent in the same period.

It is no longer even fashionable to claim that "apathy" and afinity for familiar surroundings explain the rising Negro concentration in central city ghettoes. Whatever empirical data available seem to indicate a strong preference on the part of most ghetto residents for improved housing and for residences in non-ghetto neighborhoods, if it were possible.[47]

TABLE II

TWELVE LARGEST SMSA's AND PERCENTAGE OF WHITES IN TOTAL POPULATION IN CENTRAL CITY AND SUBURBAN RING 1940, 1950 & 1960

	Central City			Suburban Ring		
	1940	1950	1960	1940	1950	1960
New York City	93.6	90.2	85.3	95.4	95.5	95.2
Los Angeles	94.0	90.2	84.7	97.7	97.3	95.9
Chicago	91.7	85.9	76.4	97.8	97.1	96.9
Philadelphia	86.9	81.7	73.3	93.4	93.4	93.7
Detroit	90.7	83.6	70.8	97.1	95.0	96.2
San Francisco - Oakland	95.1	88.2	78.9	96.4	93.2	93.2
Boston	96.7	87.7	90.2	99.1	99.2	99.0
Pittsburgh	90.7	82.0	83.2	96.4	96.5	96.6
St. Louis	86.6	94.7	71.2	93.3	92.7	93.7
Washington, D. C.	71.5	64.6	45.2	86.3	91.3	93.6
Cleveland	90.3	83.7	71.1	99.1	99.2	99.2

SOURCE: Leo Schnore, **The Urban Scene** (New York: The Free Press, Collier-Macmillan, Ltd. London, 1965) p. 268.

John Kain estimates that as many as 40,000 Detroit Negro workers and nearly 112,000 Chicago Negroes might be willing to move from central to outlying residential areas "if they were free to choose locations similar to those of low-income whites employed at the same workplaces."[48]

Thus the limited access of Negroes to the housing market in general, and the suburban housing market in particular, has probably been as detrimental to employment opportunities as to housing welfare.

None of this is to imply that housing segregation and ghetto isolation pose the only social barriers to heightened labor mobility and job access for disadvantaged workers. A host of other determinants, such as family considerations, neighborhood attachment, loss of pension and seniority rights, etc., influence residential mobility decisions. The point made here, however, is that the very existence of the ghetto and the stubborness of widespread housing segregation seriously benumb any attempt to evaluate independently other determinants of Negro worker mobility.

Many authorities have expressed hopes—or fears—that the Model Cities Program might serve as one of the federal government's chief wedges in achieving a breakthrough against rigid patterns of housing market segregation so counter-productive to ghetto job opportunities. A Philadelphia news source, citing criticism of the Model Cities Program by community leaders, reported:[49]

> "Richard Watson, executive director, North Philadelphia Corp, charged that Model Cities spending would merely 'gild the ghetto' . . . Both Watson and Mrs. Perry [of the Philadelphia Council for Community Advancement] criticized the Model Cities proposal for failing to mention the need for free choice in housing. This issue, said Mrs. Perry, was 'sharply raised' in conferences that preceeded the drafting of the funding request but, at the end, it was dropped . . . From Robert C. Weaver, Secretary of Housing and Urban Development, on down there was a determination that the Model Cities Program should 'attack segregation'."

Illustrative of the fears that the program would aim at "racial balance schemes" are the remarks on the floor of the House by Rep. Paul Fino of New York City:[50]

> Two months ago, March 17, 1967, HUD officials told the Federal Bar Association that demonstration cities preference would be given to cities which used scattered rent subsidy and public housing projects to integrate middle-income neighborhoods . . . if you are opposed to HUD's deception and all of these economic and racial balance schemes, then I urge you to support this amendment and cut the [Model Cities] funds.

The proportion of nonwhites in the U.S. population increased slightly during the past quarter century...

but it more than doubled in central cities...

and declined in suburbia.

(Source: U.S. Dept. of Labor)

Whatever the official thinking concerning open occupancy behind the program, the guidelines omit specific reference to this issue, as do practically all the Model Cities proposals we examined.

Component "C" (Housing Choice) of the guidelines instructs localities to meet this standard:

> A comprehensive city demonstration program is eligible for assistance only if it will contribute to a well-balanced city with maximum opportunities in the choice of housing accommodations for all citizens of all income levels.

This standard, coupled with Executive Order 11246 and the mandatory compliance provisions of Title VI of the 1964 Civil Rights Act, presumably equip the Department of Housing and Urban Development with reasonably broad authority to assist freer housing choices for ghetto residents. Yet virtually all the proposals we reviewed at best merely tipped their hats to the issue.

One city, where failure to enact a revised open housing ordinance led to energetic protests by local civil rights groups, approaches the standards of Component "C" this way:

> "[Model City] has a nationally acclaimed record of racial reconciliation and the guaranteeing of the rights of its minorities . . . recognizes the existence of inordinate concentrations of its Negro citizens within the Model Neighborhood Area; that coupled with other social problems . . . this is an unhealthy situation which the community cannot abide.
>
> "[Model City] is troubled with the universal question as to what extent this concentration — with its accompanying inertia — exists in and of itself, or is forced through community attitudes and customs. Whether either, or both . . . higher income Negro families do not move from the area, thus further restricting an already limited center-city pool of available standard housing . . ."

How does the community propose to remedy this situation? It commits itself to nothing more than "efforts to improve human understanding" lamenting that "the solution will not come easily" with the warning: "Nothing lasting or satisfactory can be forced, and no arbitrary, preplanned patterns for housing occupancy or opportunity can be set."

Many cities have interpreted the "Housing Choice" standards of the Guidelines to refer only to "choice" within the targeted slum area. One Southwestern city, which has no open occupancy ordinance, states in its application that the "residents should be permitted widest possible choice within the Model Neighborhood Area."

It is clear, then, that many central localities are not yet prepared to approach the thorny issues of open occupancy in housing, let alone coordinate arrangements with governing units in suburban communities to provide wider metropolitan housing choices for centrally confined ghetto residents.

If the Model Cities Program is to come to grips with what we consider to be the central urban manpower problem — employment dispersal away from centrally anchored pockets of unemployment — it must either encourage new centralization in jobs, decentralization in racial ghettoes, or both, in the absence of solutions to metropolitan transportation problems. The proposals we have examined, however, are clearly inadequate in these terms.

The preceeding discussion has focused on the dominant trends and manpower implications of outmigration, ghetto concentration and employment dispersal occuring in central cities and fringes. The chief responses of urban policy-makers for coping with these trends and implications affecting disadvantaged workers were evaluated in terms of their contribution to (1) activating the demand for idle manpower, (2) upgrading the supply and (3) improving the functioning in the spatial organization of the metropolitan labor market.

SECTION IV: URBAN RENEWAL AND RELOCATION — SOME EMPLOYMENT IMPLICATIONS

Included in the Model Cities legislation are provisions for urban renewal and relocation projects which are to be coordinated within the framework of the comprehensive demonstration activities. It is therefore useful at this juncture to draw some labor market implications from past renewal practices to better alert those framing Model Cities strategies in this area.

Component "K" (Relocation) specifies the statutory standard as follows:

> A comprehensive city demonstration program shall include a relocation plan the provisions and procedures of which meet relocation standards equivalent to those prescribed for urban renewal projects. Relocation activities, to the maximum extent feasible, should be coordinated with the increase in the supply of standard housing for low and moderate-income occupancy . . . in order to best maintain the available supply of housing for all such families and individuals throughout the city.

The urban renewal program derived its initial motivation in the desire for "slum clearance," but soon the rebuilding of declining central areas of cities, especially downtown business districts, came to receive primary emphasis. Renewal essentially entails the acquisition of large tracts by the local planning agency, and a replanning of the area for subsequent resale or leasing of that portion not required for public use to private developers for rebuilding or rehabilitation. With experience, however, it was quickly seen that minority groups and low-income families — two largely overlapping categories — suffered disproportionately in the dislocations necessitated by the process.

Thus critics charged that, contrary to its original intent, the program consituted a polygamous union between federal financing, local agencies and private developers to dispossess the poor and raze their buildings, in order to construct gleaming new developments out of their financial reach. Peter Marris wryly observed: "The dispossed enjoy as their reward a distant view of luxury apartments rising over their old homes."[1]

Some of the evil effects charged to the program by critics are: that it contributes to the destruction of functioning communities and a further weakening of the social fabric developed by the poor; that it serves to perpetuate or even increase the substandard housing of many relocatees, most of whom are minority group members; that it has led to an increase in the rents paid by relocated families, thereby reducing the amount of money

left for food, clothing, etc.; that it forces many of the victims of relocation to scurry about the city from apartment to apartment, each time keeping just one jump ahead of the bulldozer; that it swells the existing slums with new refugees from urban renewal and other types of construction; and that in sum, it heightens the alienation of these groups by demonstrating the limited value placed on their welfare by the larger society.

The 1949 Housing law merely stipulated that displaced persons were to be relocated in "safe, decent, and sanitary housing," but left the implementation of this goal entirely in the hands of the local community; it offered little direct assistance to the displaced. The dimensions of the problem, however, gained public attention in the debate over the program's achievements in terms of the welfare of the relocatees. In 1964, Chester W. Hartman, a sociologist at the MIT-Harvard Joint Center for Urban Studies, published an extensive analysis of previous investigations of relocation in conjunction with a report of his own empirical findings on relocation's social consequences in Boston's West End renewal area. His report[2] documented many of the charges leveled against the program.

But his findings were quickly challenged in Washington by results from a special survey done in 1964 by the Bureau of the Census,[3] at HUD's request, which appeared to contradict most of Hartman's conclusions, and presented a more favorable picture of the effects of the program. This was by no means a debate stopper, since the critics challenged the interpretation of the data and noted some issues that the survey failed to investigate.

One upshot of the controversy has been rising opposition on the part of local community and civil rights groups to the unfettered urban renewal practices (which have since been tightened up) that marked much of the program's past.

It is not the aim of this monograph to examine the chief social issues raised by broad urban renewal operations. But any attempt to evaluate the program's impact on different aspects of social welfare must allow for three important considerations. First, official statistics on the effects of displacement operations, both in terms of completeness and accuracy, leave much to be desired. Second, the paucity of available standard low-income housing in most central cities have confounded even the best laid and most humane renewal plans. Finally, given the strong probability that the typical relocating family will be non-white, the processes of the program frequently run afoul of housing market segregation. As we have seen earlier, the latter factor is an important obstacle as well to residential mobility and job access of disadvantaged workers. Whatever else can be claimed for the urban re-

newal program, it has made little contribution to the alleviation of these particular manpower problems.

For example, in the Census Bureau's relocation survey of 132 cities cited above, only about 10 percent of whites and a similar proportion of non-whites with fixed places of employment were required to change jobs in the post-relocation situation, but 38 percent of Negroes and 35 percent of whites reported longer journeys to work after relocation compared with only 13 percent of both groups who said they experienced journeys to work as a result of relocation. In short, an additional one in four Negroes and one in five white workers, endured longer work journeys after being relocated.

Much more serious, however, is that despite the study's concession that "Poverty was common among the families covered by the survey," it excluded data for 36 percent of displaced household heads "who had no fixed place of employment . . . like laborers . . . charwomen, etc.," in addition to omitting data on the unemployed and elderly. It also omitted individual householders, although they comprised 30 percent of all displaced housholds. When we add to these categories the 23 percent of households which were to be included in the survey but could not be found, the incompleteness of the data becomes readily apparent.

It will be recalled that Section III above detailed significant information on the characteristics of the labor force in poverty areas of major cities. These showed a disproportionate number of the residents were either unemployed or were engaged in the kinds of marginal employment that required them to move often from workplace to workplace.

Many other adult men were either "unfound" or were not in the labor force. It follows, then, that the Census' relocation survey must have omitted more than half of all ghetto residents affected by displacement!

If this deduction is accurate, a valid picture of the impact of relocation on ghetto employment can only be surmised. At best, displacement was no asset in this respect, and the presumption is strong that it compounded job market problems for those affected.

In some areas urban renewal operations have had the effect of displacing workplaces employing mainly lower-skilled workers to make room for the construction of huge office buildings with little use for blue collar labor.[4] In other areas, low-income housing and accommodations have been bulldozed, eliminating access to local job opportunities for disadvantaged migrants.[5]

But the Achilles heels of the relocation part of urban renewal — and the

chief reasons why its operations have been stymied by local opposition in numerous cities across the country[6] — remain the chronic shortage of standard low-income housing and the growing confinement of Negro ghettoes to central portions of the metropolitan areas.

The private housing market builds probably no more than one-eighth of all housing within reach of low-income families, and the flow of Federal appropriations for public housing has dried to all but a trickle. The median price of new one-family homes was estimated to be over $21,000 in 1966, well out of reach of virtually all families under $5,000 income. " . . . Public housing, the key to effective urban redevelopment, has become so unpopular that . . . the private real estate interests no longer bother to attack it." observed one specialist. Yet the urgent unmet housing need is greatest among the poor and moderate income families, and the pressures building up in this area will soon become too compelling to ignore.

Given the paltry current additions to low-cost housing supply, the number of low-income households occupying substandard dwellings in 1969 are expected to remain virtually unchanged over 1960.[8] Since most of the middle-income population is already well-housed, the effective demand from this sector, to which the market is mostly geared, is probably not providing sufficient impetus to residential building required for economic growth and market prosperity. Hence, the 5-year slump in home building, which occurred more than 18 months before interest rates on conventional first mortgages began to climb.[9]

Economist Dorothy Newman, using the BLS input-output employment tables, conservatively estimates that a well coordinated large-scale program of rehabilitation and rebuilding to eliminate substandard housing could generate in the first year a total of 1,275,000 jobs of all kinds — 630,000 for on-site work with the remainder accruing through multipler effects.[10]

If the national government embarked on a vigorous $10 billion program of construction and rehabilitation, employing the most advanced techniques, to refurbish in one year a quarter of the 4 million sub-standard units now occupied by the disadvantaged in central cities, an estimated 1 million on-site jobs could be generated and a similar number via the multiplier. This may appear overly ambitious, but the number of sub-standard units is increasing in some cities faster than standard replacements. In New York City, the number of sub-standard housing units rose by 100,000 between 1960 and 1965.

A large-scale rehabilitation program as an initial strategy may be pre-

ferable to present housing approachs on two grounds. First, its employment potential per unit for inexperienced and underskilled workers is probably higher, and second, it avoids the damaging displacement effects in housing and employment welfare so widely condemned in urban renewal practices. The emphasis now must be shifted from slum "clearance" to increasing the housing inventory for low-income families and in this process, to maximize the employment potential of the labor force in the target slum areas. The past 18 years of urban renewal experience is a powerful argument against extensive slum demolition, even for public housing projects, except in cases where slum vacancies are sufficient to give the residents an opportunity of wider choices in a variety of settings.

If the Model Cities approach is truly to be an innovation in urban replanning, it must steer clear of some of the more common tactical blunders by which renewal and relocation practices have come to grief in many localities. This warning needs to be raised since the guidelines require that relocation plans meet the "standards prescribed for urban renewal projects." But the point is that these "standards" have been honored in the breach in many localities, especially since their execution and assessment have been left in the hands of the agencies responsible for the plan's success.

Local inability to meet the more rigorous relocation standards, coupled with disinterest or calculated delays by prospective developers, have stymied and postponed urban renewal projects in many Model Cities target areas. Since the relocation component in proposals we have reviewed indicate no novel solutions to the quandary of "slum clearance" amid the dearth of standard low-cost housing, perhaps a more promising course would be to employ the Model Cities approach in spurring modernization and reform of existing local housing practices and policies, i.e., to prod local planning agencies in the search for feasible alternatives to practices necessitating major relocations involving low-income tenants.

SECTION V — CONCLUSION: ASSESSING THE MANPOWER COMPONENT IN MODEL CITIES STRATEGIES

In the initial section of this paper we sought to focus on a process for isolating and identifying the "explanatory" roots to urban social decay. It was noted that the Model Cities Program places particular emphasis on encouraging local strategies that meet the rather vague and ambiguous standards of program coordination and comprehensiveness set forth in the guidelines. The guidelines further require the city's program to be "of sufficient magnitude to make a substantial impact on the physical and social problems and to remove or arrest blight and decay in entire sections of neighborhoods," although all of this has to bear fruit "within a reasonably short period of time." Thus limited resources are called upon to finance both more and better housing along with expensive coordinative planning. These apparently conflicting provisions of Model Cities should serve as a warning to planners against reading the guidelines too rigidly.

In mapping out a coherent integrated strategy, the planner must settle on a suitable technique for selecting and relating distinct program components. For this, an overall conceptual approach is needed for sifting, from a bewildering jungle of possible choices, those that are identified as "leading links." The burden of this monograph has been to demonstrate the "leading" character of the manpower link in the intricate social tangle of urban problems.

Our evidence presented at some length the large-scale geographical shifts occuring in the spatial distribution of employment, particularly industrial jobs, within metropolitan areas, and the implications briefly touched upon were the changing metropolitan role of job market information, urban commuting problems and housing market segregation, further clouding the employment prospects of ghetto job-seekers. Thus the potential mismatch of jobs and manpower taking shape in metropolitan areas revolves around man-made impediments to freer mobility of productive resources **within** urban labor market areas.

Since problems of productive utilization of ghetto manpower are metropolitan in character, only the framing of metropolitan responses can be expected to cope with them in the long run. This inescapable fact appears at best only dimly recognized in the manpower components (component "J") in the two dozen Model Cities proposals we examined, or even in the statutory standard of the guidelines which reads:

> A comprehensive city demonstration program is eligible for assistance only if it is of sufficient magnitude to make marked pro-

78

gress in reducing underemployment and enforced idleness, to provide maximum opportunities for employing residents of the area in all phases of the program, and to enlarge opportunities for work and training.

A chief failing of the Model Cities formulation was the omission of standards to applicant localities requiring evidence of greater metropolitan coordination on labor market problems between inner cities and associated suburban localities. While this would have posed a difficult undertaking for some cities, particularly those in states where formal agreements for metropolitan coordination require approval by state legislatures, it could hardly be more difficult or ambitious than some of the standards included in the present guidelines.

While none of the applications we examined meet the metropolitan approach, there are salutary features in a number of proposals that could strengthen the manpower component in the overall demonstration program.

An eastern city plans to establish a "job bank" consisting of an array of job vacancy listings for applicants in the central city and four associated suburban counties. These listings are expected to be matched on the supply side against inventoried listings of qualifications and skills possessed by Model Neighborhood residents. To effect and augment indicated matches, demonstration shuttle bus services linking prospective applicants to available openings in other parts of the metropolitan area will be initiated when necessary.

Without underestimating the practical difficulties inherent in such a scheme, the applicant city creditably seeks to introduce to its target area unemployed and underemployed the wider metropolitan employment choices available. Thus, in this case, dispersal of job opportunities is matched with dispersal of job search efforts as well.

A quite different manpower tack is taken by another applicant city which, in view of secular national and local occupational trends, seeks to transform this locality into a "service center," grooming the target area unemployed youth and adaptable adults to the current and projected openings in health, education, welfare agencies and branches of the civil service. As part of the scheme, the applicant city plans a major overhaul in the system of vocational education to better attune it to "the growing special needs of a service economy." This strategy, it will be recalled, is geared to reinforcing and exploiting what are perceived to be the "natural" growth centers and trends within the labor market and thus easing the pain of transition.

The only drawback to this approach is the over-readiness of this appli-

cant city to "write off" the growing new job openings in evidence in its suburban ring with the unsubstantiated conclusion that " . . . the enterprises ringing the suburbs outside [applicant city] do not provide the kind of job opportunities which model neighborhood residents can qualify for."

A southeastern city's application is notable in its plan to (a) establish a training program in the building trades and (b) to take "immediate steps to open local union building trade membership to all, regardless of race, color or creed." In addition, the applying locality intends to institute New Careers trainee positions in fields of health and education that will subsequently be linked in with recurring vacancies in permanent agency positions.

But while a few applicant cities also mention the need to eliminate "cultural" and discriminatory barriers to equal employment opportunity, virtually **all** the proposals examined appear somehow to view unemployment problems as defects of the **unemployed person.** Rarely is there an awareness, or an admission of awareness, that job market circumstances, artificial and institutional barriers, or job access problems weigh heavily, and sometimes decisively, in the employment fortunes of the poor.

Applications, in general, evidenced little awareness of the complexity of manpower problems, or how metropolitan labor markets are interwined with existing problems of transportation, job search and residential segregation within the commuting orbit. This probably accounts for the inability of many proposals to really regard the manpower component as an integrating link in the comprehensive demonstration approach.

Essential Ingredients in the Model Cities Manpower Component

Some modest possibilities for influencing the demand for ghetto manpower will obviously be uncovered in the implementation of limited rehabilitation and physical improvement efforts to bring structures and facilities up to code standards. (It is less than likely that resources to accomplish more than this limited objective will be available under Model Cities funding). This undertaking could employ a number of jobless adult men on a continuing basis, and would serve to restore ties to the labor market of "discouraged" workers who dropped out of the labor force or never entered it.

A second group whose renewal of ties to the labor market would produce a measure of "external economies" in the form of reduction of public assistance costs are able-bodies female heads of familes. Many applications propose a significant expansion of day-care and child-care centers, augmented by increased neighborhood health clinics and homemaker serv-

ices employing target area residents, which might contribute to more positive work experience, while partly bridging the community's yawning gap in supportive services. But increasing the participation rate of women in this category does not seem to be coupled with comparable measures to develop viable job opportunities.

A third target group for whom a more specialized and structured initiation to the urban job market should be attempted are the area's disadvantaged youth. Here the manpower component in the program might include no more than a brief orientation and pre-training (varying from 2 to 6 weeks). The pre-training phase might be linked up in continuum to a battery of in-service and on-the-job "New Careers" positions in civil services and in cooperating private firms. This would require enlisting the cooperation of key elements in local trade associations, and in government, the formal heads of civil service executive boards in given regions. Important in framing the new urban manpower component of the demonstration programs is to avoid developing non-specific, targetless and undirected "job training" that may lead back to the sidewalks, reinforcing despair and cynicism.

However, at the heart of the manpower demonstration component must be effective means for improving the operation of and matching in the labor market. This could be achieved through (a) transportation demonstration projects to test the relative effectiveness of adapting a special ghetto transit facility for linking model neighborhood residents to accessible workplaces in the urban fringes and (b) effective labor mobility demonstration projects (Sections 208 and 306 MDTA) that would combine job market information and counseling for metropolitan area job openings with (c) formal arrangements for securing housing accomodations in suburban areas in order to afford target area workers easier and more varied alternative employment opportunities.

A judicious ulitization of rent supplements, coupled with vigorous application of open occupancy standards could have considerable impact in promoting ghetto dispersal and labor mobility **inside** metropolitan areas. This aspect of the component may appear unduly courageous to some, but in the light of job decentralization trends in metropolitan areas, no immediate dent in the manpower crisis plaguing slum areas of city cores is possible in the face of the demonstrably limited mobility of ghetto work-seekers. To ignore the problem altogether would lend substance to the charges that the Model Cities Program is designed to perpetuate, reinforce, and contain racial ghettoes inside central cities, while lending a spurious Potemkin-village character to the spreading blight.

At the national level stronger efforts toward banning metropolitan

housing segregation must be undertaken, coupled with measures to encourage localities to take into account ghetto transportation needs in the formulation of metropolitan-wide transportation schemes.

Sen. Ribicoff has proposed an important amendment that would enlarge the functions of the Economic Development Administration to include economic development responsibilities in urban slum areas. His amendment would enable the EDA to provide financial assistance under Title II of the Economic Development Act to public works and business loan projects, thus sparking additionally needed job opportunities in urban core areas of high concentrated unemployment. Any city slum area of 20,000 or more population could then be designated an urban redevelopment area.

One feature of this proposed amendment would greatly enhance the effectiveness of, and confidence in, the Model Cities Program. That is the mandatory requirement of inter-agency coordination between the Secretaries of Commerce, Labor, Housing and Urban Development, and the Director of the Office of Economic Opportunity. This kind of coordination is not yet mandated under the Model Cities legislation, and consequently many localities entertain serious doubts about the capabilities or likelihood of the various federal agencies to coordinate separate reviews and fundings required in a coherent and integrated Model Cities application:

> Recognizing that the Federal Government has difficulty in coordinating its own activities, many cities fear that applications will get caught in the cross-fire between agencies. No new means of inter-agency coordination has been provided for the Model Cities Program.

Yet the Model Cities program does represent a fresh and daring innovation in urban planning, and while its approach must be cast in metropolitan terms to become truly effective, it has already served as a spur to novel and bold thinking in an area too long cursed by a physical "bricks and mortar" approach to severe problems of urban decline.

APPENDIX C

DEMONSTRATION CITIES AND METROPOLITAN DEVELOPMENT ACT OF 1966
(Public Law 89-754)
Title I — Comprehensive City Demonstration Programs

Findings and Declaration of Purpose

Sec. 101. The Congress hereby finds and declares that improving the quality of urban life is the most critical domestic problem facing the United States. The persistence of widespread urban slums and blight, the concentration of persons of low income in older urban areas, and the unmet needs for additional housing and community facilities and services arising from rapid expansion of our urban population have resulted in a marked deterioration in the quality of the environment and the lives of large numbers of our people while the Nation as a whole prospers.

The Congress further finds and declares that cities, of all sizes, do not have adequate resources to deal effectively with the critical problems facing them, and that Federal assistance in addition to that now authorized by the urban renewal program and other existing Federal grant-in-aid programs is essential to enable cities to plan, develop, and conduct programs to improve their physical environment, increase their supply of adequate housing for low and moderate-income people, and provide educational and social services vital to health and welfare.

The purposes of this title are to provide additional financial and technical assistance to enable cities of all sizes (with equal regard to the problems of small as well as large cities) to plan, develop, and carry out locally prepared and scheduled comprehensive city demonstration programs containing new and imaginative proposals to rebuild or revitalize large slum and blighted areas; to expand housing, job, and income opportunities; to reduce dependence on welfare payments; to improve educational facilities and programs; to combat disease and ill health; to reduce the incidence of crime and delinquency; to enhance recreational and cultural opportunities; to establish better access between homes and jobs; and generally to improve living conditions for the people who live in such areas, and to accomplish these objectives through the most effective and economical

concentration and coordination of Federal, State, and local public and private efforts to improve the quality of urban life.

Basic Authority

Sec. 102. The Secretary of Housing and Urban Development (hereinafter referred to as the "Secretary") is authorized to make grants and provide technical assistance, as provided by this title, to enable city demonstration agencies (as defined in Section 112(2)) to plan, develop, and carry out comprehensive city demonstration programs in accordance with the purposes of this title.

Eligibility for Assistance

Sec. 103. (a) A comprehensive city demonstration program is eligible for assistance under sections 105 and 107 only if:

(1) physical and social problems in the area of the city covered by the program are such that a comprehensive city demonstration program is necessary to carry out the policy of the Congress as expressed in section 101;

(2) the program is of sufficient magnitude to make a substantial impact on the physical and social problems and to remove or arrest blight and decay in entire sections or neighborhoods; to contribute to the sound development of the entire city; to make marked progress in reducing social and educational disadvantages, ill health, underemployment, and enforced idleness; and to provide educational, health, and social services necessary to serve the poor and disadvantaged in the area, widespread citizen participation in the program, maximum opportunities for employing residents of the area in all phases of the program, and enlarged opportunities for work and training;

(3) the program, including rebuilding or restoration, will contribute to a well-balanced city with a substantial increase in the supply of standard housing of low and moderate cost, maximum opportunities in the choice of housing accommodations for all citizens of all income levels, adequate public facilities (including those needed for education, health and social services, transportation, and recreation), commercial facilities adequate to serve the residential areas, and ease of access between the residential areas and centers of employment;

(4) the various projects and activities to be undertaken in connection with such programs are scheduled to be initiated within a reasonably short period of time; adequate local resources are, or will be, available for the completion of the program as scheduled, and, in the carrying out of the program, the fullest utilization possible will be made of private initiative and enterprise; administrative machinery is available at the local level for carrying out the program on a consolidated and coordinated basis; substantive local laws, regulations, and other requirements are, or can be expected to be, consistent with the objectives of the program; there exists a relocation plan meeting the requirements of the regulations referred to in section 107; the local governing body has approved the program and, where appropriate, applications for assistance under the program; agencies whose cooperation is necessary to the success of the program have indicated their intent to furnish such cooperation; the program is consistent with comprehensive planning for the entire urban or metropolitan area; and the locality will maintain, during the period an approved comprehensive city demonstration program is being carried out, a level of aggregate expenditures for activities similar to those being assisted under this title which is not less than the level of aggregate expenditures for such activ-

ities prior to initiation of the comprehensive city demonstration program; and

(5) the program meets such additional requirements as the Secretary may establish to carry out the purposes of this title: *Provided,* That the authority of the Secretary under this paragraph shall not be used to impose criteria or establish requirements except those which are related and essential to the specific provisions of this title.

(b) In implementing this title the Secretary shall

(1) emphasize local initiative in the planning, development, and implementation of comprehensive city demonstration programs;

(2) insure, in conjunction with other appropriate Federal departments and agencies and at the direction of the President, maximum coordination of Federal assistance provided in connection with this title, prompt response to local initiative, and maximum flexibility in programing, consistent with the requirements of law and sound administrative practice; and

(3) encourage city demonstration agencies to (A) enhance neighborhoods by applying a high standard of design, (B) maintain, as appropriate, natural and historic sites and distinctive neighborhood characteristics, and (C) make maximum possible use of new and improved technology and design, including cost reduction techniques.

(c) The preparation of demonstration city programs should include to the maximum extent feasible (1) the performance of analyses that provide explicit and systematic comparisons of the costs and benefits, financial and otherwise, of alternative possible actions or courses of action designed to fulfill urban needs; and (2) the establishment of programing systems designed to assure effective use of such analyses by city demonstration agencies and by other government bodies.

(d) Nothing in this section shall authorize the Secretary to require (or condition the availability or amount of financial assistance authorized to be provided under this title upon) the adoption by any community of a program (1) by which pupils now resident in a school district not within the confines of the area covered by the city demonstration program shall be transferred to a school or school district including all or part of such area, or (2) by which pupils now resident in a school district within the confines of the area covered by the city demonstration program shall be transferred to a school or school district not including a part of such area.

Financial Assistance for Planning Comprehensive City Demonstration Programs

Sec. 104. (a) The Secretary is authorized to make grants to, and to contract with, city demonstration agencies to pay 80 per centum of the costs of planning and developing comprehensive city demonstration programs.

(b) Financial assistance will be provided under this section only if (1) the application for such assistance has been approved by the local governing body of the city, and (2) the Secretary has determined that there exist (A) administrative machinery through which coordination of all related planning activities of local agencies can be achieved, and (B) evidence that necessary cooperation of agencies engaged in related local planning can be obtained.

Financial Assistance for Approved Comprehensive City Demonstration Programs

Sec. 105. (a) The Secretary is authorized to approve comprehensive city demonstration programs if, after review of the plans, he deter-

mines that such plans satisfy the criteria for such programs set forth in section 103.

(b) The Secretary is authorized to make grants to, and to contract with, city demonstration agencies to pay 80 per centum of the cost of administering approved comprehensive city demonstration programs, but not the cost of administering any project or activity assisted under a Federal grant-in-aid program.

(c) To assist the city to carry out the projects or activities included within an approved comprehensive city demonstration program, the Secretary is authorized to make grants to the city demonstration agency of not to exceed 80 per centum of the aggregate amount of non-Federal contributions otherwise required to be made to all projects or activities assisted by Federal grant-in-aid programs (as defined in section 112(1)) which are carried out in connection with such demonstration program: *Provided,* That no Federal grant-in-aid program shall be considered to be carried out in connection with such demonstration program unless it is closely related to the physical and social problems in the area of the city covered by the program and unless it can reasonably be expected to have a noticeable effect upon such problems. The specific amount of any such grant shall take into account the number and intensity of the economic and social pressures in the sections or neighborhoods involved, such as those involving or resulting from population density, poverty levels, unemployment rate, public welfare participation, educational levels, health and disease characteristics, crime and delinquency rate, and degree of substandard and dilapidated housing. The amount of non-Federal contribution required for each project in a Federal grant-in-aid program shall be certified to the Secretary by the Federal department or agency (other than the Department of Housing and Urban Development) administering such program, and the Secretary shall accept such certification in computing the grants hereunder.

(d) Grant funds provided to assist projects and activities included within an approved comprehensive city demonstration program pursuant to subsection (c) of this section shall be made available to assist new and additional projects and activities not assisted under a Federal grant-in-aid program. To the extent such funds are not necessary to support fully such new and additional projects and activities, they may be used and credited as part or all of the required non-Federal contribution to projects or activities, assisted under a Federal grant-in-aid program, which are part of an approved comprehensive city demonstration program. Such grant funds, however, shall not be used—

(1) for the general administration of local *governments; or*

(2) to replace non-Federal contributions in any federally aided project or activity included in an approved comprehensive city demonstration program, if prior to the filing of an application for assistance under section 104 an agreement has been entered into with any Federal agency obligating such non-Federal contributions with respect to such project or activity.

Technical Assistance

Sec. 106. The Secretary is authorized to undertake such activities as he determines to be desirable to provide, either directly or by contracts or other arrangements, technical assistance to city demonstration agencies to assist such agencies in planning, developing, and administering comprehensive city demonstration programs.

Relocation Requirements and Payments

Sec. 107. (a) A comprehensive city demonstration program shall include a plan for the relocation of individuals, families, business

concerns, and nonprofit organizations displaced or to be displaced in the carrying out of such program. The relocation plan shall be consistent with regulations prescribed by the Secretary to assure that (1) the provisions and procedures included in the plan meet relocation standards equivalent to those prescribed under section 105(c) of the Housing Act of 1949 with respect to urban renewal projects assisted under title I of that Act, and (2) relocation activities are coordinated to the maximum extent feasible with the increase in the supply of decent, safe, and sanitary housing for families and individuals of low or moderate income, as provided under the comprehensive city demonstration program, or otherwise, in order to best maintain the available supply of housing for all such families and individuals throughout the city.

(b) (1) To the extent not otherwise authorized under any Federal law, financial assistance extended to a city demonstration agency under section 105 shall include grants to cover the full cost of relocation payments, as herein defined. Such grants shall be in addition to other financial assistance extended to such agency under section 105.

(2) The term "relocation payments" means payments by a city demonstration agency to a displaced individual, family, business concern, or nonprofit organization which are made on such terms and conditions and subject to such limitations (to the extent applicable, but not including the date of displacement) as are provided for relocation payments, at the time such payments are approved, by section 114(b), (c), (d), and (e) of the Housing Act of 1949 with respect to projects assisted under title I thereof.

(c) Subsection (b) shall not be applicable with respect to any displacement occurring prior to the date of the enactment of this Act.

Continued Availability of Federal Grant-in-Aid Program Funds.

Sec. 108. Notwithstanding any other provision of law, unless hereafter enacted expressly in limitation of the provisions of this section, funds appropriated for a Federal grant-in-aid program which are reserved for any projects or activities assisted under such grant-in-aid program and undertaken in connection with an approved comprehensive city demonstration program shall remain available until expended.

Consultation

Sec. 109. In carrying out the provisions of this title, including the issuance of regulations, the Secretary shall consult with other Federal departments and agencies administering Federal grant-in-aid programs. The Secretary shall consult with each Federal department and agency affected by each comprehensive city demonstration program before entering into a commitment to make grants for such program under section 105.

Labor Standards

Sec. 110. (a) All laborers and mechanics employed by contractors or subcontractors in the construction, rehabilitation, alteration, or repair of projects which—

(1) are federally assisted in whole or in part under this title and

(2) are not otherwise subject to section 212 of the National Housing Act, section 16(2) of the United States Housing Act of 1937, section 109 of the Housing Act of 1949, or any other provision of Federal law imposing labor standards on federally assisted construction,

shall be paid wages at rates not less than those prevailing on similar construction in the locality as determined by the Secretary of Labor in accordance with the Davis-Bacon Act, as amended (40 U.S.C. 276a—276a-5): *Provided,*

That this section shall apply to the construction, rehabilitation, alteration, or repair of residential property only if such residential property is designed for residential use for eight or more families. No financial assistance shall be extended to any such projects unless adequate assurance is first obtained that these labor standards will be maintained upon the construction work.

(b) The Secretary of Labor shall have, with respect to the labor standards specified in subsection (a), the authority and functions set forth in Reorganization Plan Numbered 14 of 1950 (15 F.R. 3176; 64 Stat. 1267; 5 U.S.C. 133z-15), and section 2 of the Act of June 13, 1934, as amended (48 Stat. 948; 40 U.S.C. 276c), and the Contract Work Hours Standards Act (76 Stat. 357).

Appropriations

Sec. 111. (a) There are authorized to be appropriated, for the purpose of financial assistance and administrative expenses under sections 104 and 106, not to exceed $12,000,000 for the fiscal year ending June 30, 1967, and not to exceed $12,000,000 for the fiscal year ending June 30, 1968.

(b) There are authorized to be appropriated, for the purpose of financial assistance and administrative expenses under sections 105, 106, and 107, not to exceed $400,000,000 for the fiscal year ending June, 1968, and not to exceed $500,000,000 for the fiscal year ending June 30, 1969.

(c) Appropriations authorized under this section shall remain available until expended.

Definitions

Sec. 112. As used in this title—

(1) "Federal grant-in-aid program" means a program of Federal financial assistance other than loans and other than the assistance provided by this title.

(2) "City demonstration agency" means the city, the county, or any local public agency established or designated by the local governing body of such city or county to administer the comprehensive city demonstration program.

(3) "City" means any municipality (or two or more municipalities acting jointly) or any county or other public body (or two or more acting jointly) having general governmental powers.

(4) "Local" agencies include State agencies and instrumentalities providing services or resources to a city or locality, and "local" resources include those provided to a city or locality by a State or its agency or instrumentality.

Grant Authority for Urban Renewal Projects which are Part of Approved Comprehensive City Demonstration Programs

Sec. 113. Section 103(b) of the Housing Act of 1949 is amended by inserting after the first sentence the following new sentence: "In addition to the authority to make grants provided in the first sentence of this subsection, the Secretary may contract to make grants under this title, on or after July 1, 1967, in an amount not to exceed $250,000,000: *Provided,* That the authority to contract to make grants provided by this sentence shall be exercised only with respect to an urban renewal project which is identified and scheduled to be carried out as one of the projects or activities included within an approved comprehensive city demonstration program assisted under the provisions of section 105(c) of the Demonstration Cities and Metropolitan Development Act of 1966."

State Limit

Sec. 114. Grants made under section 105 for projects in any one State shall not exceed in the aggregate 15 per centum of the aggregate amount of funds authorized to be appropriated under section 111.

*GUIDELINES; *DATA COLLECTION; *YOUTH PROGRAMS; *UNEMPLOYED; *COMMUNITY PROGRAMS

Community programs for unemployed youth are attempts to change people. They have a set of goals, a defined population, and a set of procedures by which they hope to reach and change members of that target population. In this paper, a plea is made for a much more extensive data collection system to provide information in sufficient detail and in sufficient quantity so that some kind of generalizable and applicable knowledge about such programs can be obtained, including an estimate of the extent to which the programs have succeeded. Guidelines are discussed for (1) the inclusion of more than one program in the same basic data collection system, (2) the inclusion of the total program target population, whether they are ultimately involved in the program or not, into the data collection system, (3) provision for intensive followup over an extended period of time, and (4) the inclusion of much more detailed information about what happens to the youth while being served by the program. This paper is part of a project conducted by the N.Y.U. Center for the Study of Unemployed Youth under a grant provided by the Office of Juvenile Delinquency and Youth Development, U.S. Department of Health, Education, and Welfare to develop curriculum materials for program planners and operators.

GUIDELINES FOR A DATA COLLECTION SYSTEM FOR COMMUNITY PROGRAMS FOR UNEMPLOYED YOUTH

In this paper I have attempted to set down some basic guidelines for the development of a data collection system for community programs for unemployed youth. At the outset, one very important distinction should be made. For me, the purpose of such a data collection system is to provide information in sufficient detail and in sufficient quantity so that some kind of generalizable and applicable knowledge about such programs can be obtained, including an estimate of the extent to which the programs have succeeded in coming to grips with the problem they are designed to solve. Simple reporting of program and financial activities, as such, will be given no attention. As necessary as they are to provide a basis for judging whether public or private money has been spent honestly, such reports usually provide no clues at all as to whether the money has been spent wisely and effectively. Social action practitioners have developed a wide variety of formats for reporting about programs—staff activity, the size and characteristics of clientele, outcome data such as placements on jobs, etc. However, there is a double danger in such reports when they are presented and accepted as the whole story. They really do not provide a basis for judging the worth of a program, but they often seem to and are often accepted as having done just that. In a typical report, statements are made concerning the number of youth counseled in the program and the number subsequently placed on jobs in the community. If the numbers are large enough— and what constitutes "large enough" is likely to be highly subjective and to vary widely from place to place—they tend to be accepted as **prima facie** evidence of the fine work the program is doing. It is assumed that these youth would not be working if it were not for the program and that the counseling was a necessary ingredient in the process leading to that outcome. The remainder of this paper is likely to contain little of interest to those for whom such "evidence" is regarded as sufficient.

Community programs for unemployed youth are interventions; that is, they are explicitly or implicitly, attempts to change something, usually people. Rationally planned, they have at a minimum, a set of goals, a defined target population, and a set of procedures by which they hope to reach and change members of that target population. Many programs fitting this general model are already in operation; even more, I suspect, are in the planning stage. During the next five or ten years, millions of dollars of public money will be spent in these various attempts to enhance the employability of hundreds of thousands of youth. Such programs should be seen as trial

efforts, as attempted solutions to a vital social problem. But we cannot assume that they necessarily are solutions. We must find out whether they are or not.

In my opinion, one major obstacle to the development of an all-out, rational, societal attack on such problems as unemployed youth is the widespread fear of apparent failure and the resulting zeal to advertise programs as successes. I am convinced that we are not going to solve social problems until each effort is viewed as an experiment, the success of which is to be measured in terms of how much is learned from it rather than how successful it can be made to look. This may not be the century in which such a reversal of attitude will take place, but those of us who see this as the only hope must continue to state our case. This shift must take place particularly in the minds of representatives of funding agencies. They must make their decisions about refunding on the basis of what has been learned about a problem and how to solve it rather than on the basis of how glowing a report can be concocted describing the magnificent "success" of particular programs. Again, the remainder of this paper is directed to those of us who want to know rather than to sell.

SOME GUIDELINES FOR A DATA COLLECTION SYSTEM

A common system for several programs. The same basic data collection system should be adopted by a number of programs for unemployed youth, ideally including several programs of each of the various types of approaches to the problem which have been and are being developed throughout the country. There are at least two very powerful reasons for this; one theoretical, the other practical. The theoretical reason is the basic need for comparative data. Our knowledge about such programs will be greatly augmented if we can obtain similar types of information, gathered in a similar manner, about a number of programs. If we can compare similar programs in different kinds of communities and different programs in similar kinds of communities, we will be even further along the road. The practical reason has to do with resources—financial and human. The data collection system suggested in these guidelines requires that a significant amount of money and effort be devoted to the gathering and processing of information. I do not believe that there is any magic shortcut to the kind of knowledge which is required. A substantial proportion of available resources will have to be allocated to the data collection component of programs for unemployed youth if valid and usable information is to be obtained. Urgent pleas are going to have to be made in order to divert sufficient funds to more intensive and systematic data collection operations than those now in use. The pre-

vailing and rather overwhelming zeal to pour all resources into "doing" and little or nothing into "knowing" must be successfully challenged. However, even the most optimistic of views must recognize that the financial resources that will be allocated to such tasks are likely to be rather limited. If one general data gathering and processing system were adopted by a number of communities the returns on the same investment would be much greater. One set of intake and process record forms could be designed, printed in multi-carbon sets, and distributed to the cooperating programs. Hundreds of man-hours would be saved in avoiding the duplication of effort involved when each program designs and produces its own set of similar data forms. One set of procedures could be designed for identifying and gathering basic information about each program's target population. Ideally, I believe this should be done in all of the cooperating communities by one central unit established or employed for this specific purpose. One set of procedures could be designed for following up, over time, the members of the target population, both program participants and non-participants. Again I believe this should be done in all the cooperating communities by one central unit. One set of coding and other data processing procedures could be designed to handle the data received from each of the cooperating programs, all compatible with a centrally operated computer tape file system including the necessary input and output computer programs for rapid, comparable, information feedback. Physical, financial and human resources for the handling of large amounts of data are still relatively limited. Good coding devices and the staff and facilities necessary for the reliable coding of large amounts of data require a great deal of effort for development and maintenance; computer programs for information feedback require a great deal of thought and effort if that information is to be intensive and tailored to the task. Therefore a combined, across-communities, centralized effort would minimize the over-all cost and maximize both the amount and comparability of the information obtained.

A target population base data file. What information is obtained, when, from whom, by whom, and in what order are likely to be important parts of an action program and may affect the success of the program. For example, information gathering procedures may affect the attitude of the potential client toward the program and possibly the motivation and effort of the program staff as well.

There appears to be good reason to believe that youth—and particularly youth of the type that fall into the category of relatively unemployable school drop-outs—resist and resent searching questioning. If they are greeted by a barrage of questions which appear unrelated to the reason they have sought out the program, they are very likely to back away from the program before

its services can be offered to them. If actually reaching those members of the target populations who need help the most is as difficult as I think it is, then every effort must be made to avoid giving them initial experiences which repel them from the situation. In addition, if a sound relationship between program staff and clientele is essential to the ultimate inducement of change, then the initial interactions between staff and client must be structured according to our most appealing hunches so as to maximize the establishment of rapport and minimize disruptive strain.

Also, there appears to be a nearly universal, if not natural, aversion among practitioners to data gathering procedures; the practitioner, believing that what he does is valuable and effective, wants to spend his time serving his clients rather than writing reports, filling out forms, and so on. He seems to much prefer working with people to working with typewriters, forms and filing cabinets. Assuming that some people are more skilled in inducing change in people than others, a rational system should aim at minimizing the amount of time that such people spend at clerical tasks. On the other hand, there are categories of information that are needed, generally for both program and research purposes, that can only be obtained through direct interview, observation or testing of the individual and that often is best obtained by people who have skills in working with other people.

I believe, therefore, that each community program for unemployed youth should obtain as much information about each member of its target population from sources other than the individual himself, and whenever possible, prior to the individual's participation in the program.

If such a target population base data file were established—and I think it is quite possible and feasible to do so—each program would already possess considerable basic background information about each "client" when he walks into the program office. The only immediate questions that would have to be asked of any given individual would be those required to identify him among the members of the target population. These data consist mainly of name and date of birth, and possibly mother's first name. These can be obtained by an office registration clerk; they are generally (except possibly for mother's name) the kind of information that anyone expects to have to give under such circumstances; and they would not involve the program staff at all at this point. This type of information, however, should be obtained with great care. Both the first and last names should be spelled carefully and verified by the individual, and the date of birth should be repeated back to the individual for confirmation. With such an "ideal" system in operation, a folder of information could be waiting for the individual at his first interview session with the program staff member assigned to him. A few, quick,

validation questions could be devised to ascertain with greater certainty that the individual in the office is the one represented by the data in the folder. Effort could then immediately proceed to attempt to offer the individual something he wants, to satisfy to some extent, if possible, the reasons he applied to the program for help in the first place. Such a procedure would, if properly implemented, avoid two of the major pitfalls confronting efforts to hold such individuals in programs: the danger of driving the individual out of the program before he gets started by barraging him with questions, and the danger of building up resentments in the client toward the worker and thus impeding future progress in the development of a working relationship between the program staff and the youth. There is little doubt that a good counselor or other program staff person can obtain such information, but it is more easily and less disruptively done gradually, over time, while a relationship is being established. If the individual remains in the program, each item in the dossier should be checked and verified and a system should be established whereby such verifications would be noted in the records. If the individual does not remain in the program, sufficient information would, in most cases, already be available for follow-up for effort to re-involve the individual in the program or for subsequent comparisons of outcome.

Follow-up of total target population. An adequate data collection system must include, in my opinion, in addition to the target population base data file, provision for intensive follow up of the total target population over an extended period of time. We must know much more about community programs for unemployed youth than the number of youth "served" and how much it cost to "serve" them.

To develop this point, let me refer to a report of one on-going program for unemployed youth, the Chicago J.O.B.S. Project. In its report for the period March 30, 1964 to May 29, 1965,[1] it was stated that during that 14 month period a total of 1,542 trainees had been registered. Of these, slightly less than half had left the program before completion of training. Half of these (approximately one-fourth of the total registered) had left "without good cause". A total of 210 were reported as placed in full time jobs. The report also states that 367 were placed in On-The-Job-Training (OJT) positions. It is my contention that a series of very important questions are left unanswered and unanswerable by a data collection and reporting system which deals only with its clientele and is unable to place such information against the backdrop of its target population.

The J.O.B.S. Project was designed to train 1,100 unemployable youth

1 Report No. 7 to the Office of Manpower, Automation and Training, J.O.B.S. Project, Chicago, Ill. March 30, '64 to May 29, '65.

to reach the necessary educational level for employment, to develop the attitudes required for employment, to acquire some job skill experience, and, finally, to be placed in employment. This target population, the unemployed, disadvantaged, school drop-out, is generally agreed to be a difficult group to reach and hold in programs. The actual—although admittedly difficult to determine—success of such programs should, in my opinion, be measured in terms of the following: what is the size and nature of the target population in the community at some given point in time; what are the characteristics of those members of the target population who are reached and who remain in the program to some terminal training point; what are the characteristics of those who are held in the program who appear to change in desired directions; and how do the members of these four categories fare in the world of work in the five or ten years following attempted intervention? Answers to questions such as these cannot be obtained without reasonably intensive follow-up of an identified target population.

The four categories are: (a) the members of the target population who are not reached by the program; (b) those who are reached but who do not remain in the program; (c) those who are reached and remain but who do not appear to change as desired by the program; and (d) those who are are reached and remain and who appear to change in desired directions. Each of the four categories has its special significance within an over-all attempt to accumulate knowledge about the problem of unemployed youth and ways to solve it. We tend to know little or nothing about the first category—the unreached. It may be that programs tend to reach those who need the service most and that the unreached fare pretty well by themselves, but I doubt it. Although there is undoubtedly a significant number of drop-outs who go into business or into craft training with family members or friends, it is more likely that an even more significant proportion of the unreached are most in need of some kind of intervention to increase the probability that they will be able to take some kind of productive and self-sustaining role in our economic system. It seems to me that for us to have any idea concerning the extent to which a given community program for unemployed youth is coming to grips with the program, we need to know what happens to this group over time.

Knowledge about general outcomes for the second category—those who are reached but drop out of the training programs—may be even more significant if we are to really know if such programs are even in a position to be successful.

Let me expand upon both of these points. Assume a target population at any given moment (which as was pointed out above is unfortunately usually unknown as to its size, location and to some extent its characteristics); then

let us assume that X proportion is, within some given period of time attracted to a program and that eventually Y proportion of those drop out of the program. Even if X is fairly large, say 80%, and Y is fairly small, say 30%, the total percentage of the target population not served by the program is 44%. If X and Y are 70% and 40%, respectively, the unserved proportion becomes 58%. Now it is a generally recognized fact that the unemployment rate of apparently hard-core unemployed 17 to 21 year old segments of the population drops considerably by the time that group is 25 to 29 years of age. It very well may be, and I believe it is highly likely, that the hard-core unemployables in the 25-29 age bracket are largely comprised of the unreachables and the program drop-outs when they were in the 17 to 21 age category. If this is substantially the case, it means that most, if not all, of the reached and served in the 17 to 21 age group would have been employed by age 25 to 29 anyway. And, therefore, subsequent reports of the employment status of previous participants in programs for unemployed youth do not necessarily constitute evidence of the success of those programs. It may be that the participants, although they would have been working anyway, would not have been employed as well without intervention—in terms of income, skill level, prestige or some other criterion. But to demonstrate this, it is not enough to show that the participants are better off than the non-participants; it must be shown that they are better off than they would have been without the intervention. It may be that the latter is in fact generally the case, but I have yet to see a program that can even begin to provide evidence pertaining to this question. A significant proportion of over-all program and research effort should, in my opinion, be directed to knowing about the unreached and the program drop-out what happens to them, why they failed to respond or dropped-out, and what their characteristics are relative to those of program participants. Without some such basic, comparative information, program reports must remain simple tabulations, not knowledge.

The key here is an intensive and extensive follow-up procedure. Ideally, as suggested previously, if one general system were adopted by a number of communities, the reliability and comparability of the information would be maximized and the cost minimized, particularly if these procedures were conducted by the same central unit.

Data concerning the intervention. The focus of the three previous guidelines for a data collection system has been on the need for the adoption of synchronized and compatible systems across programs, the identification and study of each program's target population, and the inclusion of provisions for intensive and extended follow-up of the total population. Clearly, another essential component of a desired body of information about community programs for unemployed youth is information about what happened

to those youth while they were being served by the program. Since programs from community to community are likely to vary considerably in philosophy, approach, and procedures, the possibilities for the use of identical data collection procedures by several programs are much more limited. The goals of comparability and compatibility can be attained through the adoption of identical data formats even though the substantive information may vary to some extent from program to program. The objective is to maximize the possible use of a single computer data storage and retrieval system. A central coding and data processing unit—shared by the group of cooperating programs—would make this both possible and feasible.

The in-program data collection system should attempt to follow each individual through the program, including observations made of him, decisions made about him, and intervention components he is exposed to. A generalized training model appears to me to involve the following assumptions and characteristics: (a) an individual is believed to have certain deficiencies which impede the development of a satisfactory work pattern; (b) the prediction or assumption is made that he will not fare well in the work world unless changes on all or at least some of these variables take place; and (c) the program is designed to provide services which theoretically have the power to produce changes in those variables which in turn will lead to better future performance on the part of the individual in the world of work. Therefore, information should be gathered for each individual at each point in the process: what are the individual's specific deficiencies and at what level is the individual functioning with respect to each of these variables (henceforth referred to as "deficiency variables") at intake time (or as soon afterward as is practical); with respect to which variables are efforts made by the program to induce change, and some measure, judgment, or rating of the duration and intensity of the participation by the individual in those efforts should be made and recorded; periodic measures — preferably in standardized fashion — should be taken on each of the deficiency variables (the minimum is a post or end-of-treatment measure in addition to the pre-measures; and measures should be taken on all deficiency variables whether efforts are being made to induce change or not). This information, in addition to objective measures of post-treatment work performance, will provide a better basis for estimating whether the program makes a difference or not than is usually available for real-world, large-scale programs such as these. Although such a procedure does not meet the ideal of a control group design, some estimate of the validity of the intervention model and the effects of the program may be made, in my opinion, through use of it. It should be those who change in the desired direction on the deficiency variables who significantly out-perform those who do not change, controlling

for starting functioning level. If differences in post-treatment performance are unrelated to changes in the deficiency variables, the assumptions of the program would certainly be open to question. All that would be known is that some participants in the program did better than others; but we could have been pretty sure that that would happen before we started. With this model, relative success among programs would be judged not in terms of the number of trainees placed in jobs but in terms of the program's relative ability to predict, on the basis of in-program observed change, relative post-program performance.

Ideally, agreement on the list of deficiency variables should be reached among the cooperating programs. At the very least, the major target variables of each program should be included in the list. Then if three additional steps were taken, the amount of valuable comparative information produced by such a joint effort would be vastly enhanced. First, periodic measures on all the variables should be taken on all the individuals in each program, whether or not they are regarded as important by that program or whether or not effort to change them will be made by any particular program. Second, measures on as many of these variables as possible should be taken on all drop-outs — which means that to the extent that these variables consist primarily of visual observations, and such things as school data and work history which can be obtained least disruptively, the more possible it is likely to be that the information will be obtained on a broad scale. Third, similar information should be obtained by the target population survey and follow-up unit on all or at least a sample of the "unreached," as defined at some particular point in time. Such information should provide an even better basis for estimates of the effects of the program on its target population, since it should provide a basis for the development of reasonably efficient prediction instruments of work performance.

Most programs have several alternative interventions to which they may expose their clientele, and they usually allocate youth to one or the other of these interventions, or combinations of them. A classification procedure is basic to such a system. Implicitly at least, a theory underlies the decision making process whereby allocations of individuals to the various interventions are made. Some provision should be made in the data collection system to record the highlights of this decision making process. This classification and allocation process is a vital part of any program which offers more than one intervention; it is, as far as I can tell, seldom studied to anywhere near the intensity that is probably necessary. One problem which appears to cause little concern is reliability. What reason is there to believe that a second team of "assignment personnel" would make the same decisions about any given individual as did the first team? This problem exists

within programs; it is undoubtedly more serious among programs. This problem has vast implications for the total effort. It is logically possible that a given program may have an effective set of alternate treatments available but an invalid theory or unreliable procedures upon which the allocations of individuals to the alternative treatments are made. It appears to me that we should have good reason to believe that the "theoretically appropriate" people are being exposed to the "theoretically appropriate" programs—that is, that the procedures are being reliably used—or it would be better to make random allocations and then attempt to determine empirically which kinds of interventions work best with which kinds of people.

In-program reporting procedures should include a description of the extent of participation of each of the trainees. Reference has frequently been made in this paper to participants and program drop-outs. The ultimate categorization of all of those "reached" by a program into participants and drop-outs requires some carefully thought out and explicit operational definitions. The most extreme definition of participant would require that the individual complete the training schedule designated for him; a somewhat different definition would regard him as a participant in the program (as compared with a non-participant) if he left for a satisfactory position even though he did not complete the full training schedule. At any rate, careful records should be kept—beginning dates, attenance information, terminal dates and reason for termination, etc., for each individual registered in the program. Attendance information and drop-out definitions are logically related; therefore, if comparable information is to be obtained across programs, explicit difinitions must be agreed upon and consistently used by the cooperating programs. If one program classifies individuals as drop-outs if they miss one or two training sessions in a row, it is likely to have a high drop-out rate and a high attendance rate; the reverse is likely to be true of programs that carry individuals on the books as "absent participants", even though they have missed a long series of training sesions.

Although they are likely to be very difficult to devise, some components of the in-program data collection system should aim at recording the theoretically important segments of the interventions. For example, if counseling is given a significant role in the program design, considerable effort should be devoted to capturing the nature of the conseling services offered, on an individual-counselor case basis. Data should be obtained concerning similarities and differences among the definitions of counseling, both among programs and within programs. Data should also be collected in the form of behavioral descriptions (either through observation or by interview)

concerning what counseling actually consisted of. Two counselors—or two programs—may verbalize counseling theory differently but do essentially the same things in counseling practice; the reverse is also possible. There are likely to be great variations in the amounts of time devoted to counseling, again both among programs and among counselors within programs. If such data were obtained for a number of counselors, some interesting possibilities concerning the relationship between variations in counseling technique and variations in outcome arise. For example, is there a relationship between variations in the frequency of counseling sessions, the duration of counseling sessions, or the duration of counseling sequences and success rates (by whatever criterion of success—ratings, subsequent employment history, etc). If this is true, when counselors are compared, that the greater the variance the greater the success, the notion that the more successful counselors vary their counseling efforts (that is, provide more or less counseling, etc., for different individuals) on the basis of some criteria. This indicates the clear need for the inclusion in a data collection system for procedures whereby the bases for decisions such as these that are made by such personnel as counselors get recorded. This analytical model is applicable to a wide variety of program issues. To continue the counseling example, counselors undoubtedly vary considerably in terms of their counseling emphasis or lack thereof. One counselor may tend to focus on family problems whereas another may vary the emphasis depending upon some decision system. Again, there may be a relationship between variations in focus and success—this relationship may be either direction—that is, success may be positively related to either the smaller or the larger variance. At this point we are probably not in a good position to guess the direction, although some counseling theories may provide a basis for hypothesizing in one direction or another.

Data concerning the job market and the community. There is little doubt that job placement is one of the key elements (perhaps, second only to the youth's motivation) of programs for unemployed youth. Youths from such programs who end up in regular employment in the community tend to do so through three somewhat different channels: (a) they obtain jobs "on their own;" (b) they obtain jobs with the initiative and assistance of the youth employment training program but through relatively traditional channels—state employment services, in particular; and (c) they obtain jobs through channels established directly between the youth employment training program and the employer. Programs vary in the extent to which the third channel is utilized. There are several important questions in this connection for which the program collection system should provide answers. Careful records should be kept of the way in which indi-

viduals enter the working force. (Information concerning those who obtain jobs "on their own" will most likely be best obtained through the target population follow-up procedures.) Knowledge concerning at least two sets of relationships would be very valuable: differences in the characteristics of those who obtain employment through the three different routes; and, differences in the subsequent work histories of those who obtain employment through the three different routes. A more sophisticated analysis of the latter might attempt to control for some general variable such as "employability," or a combination of scores on the so-called deficiency variables previously referred to. Central to this issue is the prevailing notion that youth of the type which comprise the target populations of programs for unemployed youth need a special, protected, or at least sympathetic, working environment in their first few real work experiences. The third channel, listed above—directly from the program to the employer—requires a job development component of the over-all program. Generally speaking, whether it tends to be admitted or not, job development personnel of youth and work programs eventually have to ask employers to take as employees (provisionally, temporarily or otherwise) individuals who are not the most qualified, or desirable, of those available. This runs directly counter to traditional placement policy whereby, theoretically at least, the most qualified available person is placed in or referred to each opening. To the extent that this is so, the employer and his supervisory personnel, their attitudes, expectations, tolerance limits, etc., may become very important variables in the over-all youth employment training program. Information should be gathered concerning these employers, how they were approached, the explanations given to them about the program, its objectives, the problems that may be involved, and how these problems may be and actually were handled. Again, if sufficient, reliable data is obtained from a number of programs, valuable information can be forthcoming. For example, studies of differences in subsequent work histories of individuals assigned to different "types" of employers could be made. If this information were related to data concerning the youth's "employability" score, some estimates could be made of the relative importance of the training component as against the work-situation component of the total program to satisfactory outcome.

Programs will also vary in the extent to which the job development personnel are integrated with the total program and the extent to which the program's concept of training extends beyond placement. Records should be kept of the activities of the job development personnel that extend beyond job finding. There seems to be only three general avenues open to programs in this regard: (1) give employers only "good kids"—and then serious questions arise concerning the extent to which the program is dealing with the basic problem; (2) attempt to place the "hard-core" youth and then keep

looking for new employers as job sources are shut off due to dissatisfaction with the performance of previous referrals; or (3) attempt to place the "hard-core" youth and work with the employer both before and while the youth is employed with him. The last is clearly the most promising and appealing but it is expensive, time consuming, and difficult; we should know if it is worthwhile.

A related problem receiving current attention is that we tend to have a "credential oriented" system and that the unemployed, disadvantaged youth is particularly vulnerable to it. A set of formal requirements have been set up for many jobs—even relatively unskilled jobs—and rather rigidly adhered to (a high school diploma is a prime example). At a minimum, records should be kept concerning the relationship between the youth's credentials and the more traditional, formal requirements of the position in which he is placed. Special attention should be given to those cases where the program may have been successful in persuading one or more employers to lower the barriers a little. Studies of the work performance and the subsequent work history of youth placed in such positions could be very valuable. If the study could be extended to include comparisons with youth in similar jobs who meet the formal requirements and with youth with the same credentials placed in jobs for which they are formally regarded as qualified, even more of great value could be learned. Ideally, as with most of the other questions raised in this paper, carefully designed action-research experiments could include, in addition to the above, special job analyses, job analyses based on required behavior, personality, and skill in the broadest sense of the word, rather than on presumed indicators of satisfactory performance.

CONCLUSIONS AND RECOMMENDATIONS

In this paper I have made a plea for a much more extensive data collection system for programs for unemployed youth than those that, in my experience, are usually used by such programs. This extension is essentially in four directions: (1) toward the inclusion of more than one program in the same basic data collection system; (2) toward the inclusion of the total program target population, whether they are ultimately involved in the program or not, into the data collection system; (3) toward the inclusion of follow-up information about the total target population well into the future (preferably a number of years); and (4) toward the inclusion of much more detailed and dynamic information about the intervention itself and its relationship to the job market and the community.

The basic assumption of this set of preliminary guidelines is that we do not know anywhere near enough about programs such as these—how

they work, how well they work, and the extent to which they are reaching and changing the truly problem segments of the population. We will remain in relative ignorance if current data collection practices are not radically overhauled.

The central recommendation of these guidelines is that several programs should attempt to pool their resources, human and financial, toward the development and implementation of a common data collection system—beginning with data forms and procedures and including compatible coding and data storage and retrieval procedures. With very few exceptions, communities are likely to be unwilling and probably unable to allocate sufficient resources to do this job properly, and even if they were there would be a tremendous amount of unnecessary duplication of effort.

*PROBLEMS; *YOUTH PROGRAMS; *COUNSELING; *REMEDIAL PROGRAMS; *JOB TRAINING; JOB PLACEMENT; FEDERAL PROGRAMS
NEIGHBORHOOD YOUTH CORPS

Experience has taught that supportive services are a vital part of a Neighborhood Youth Corps project. Supportive services include: (1) diagnostic services prior to enrollment, (2) adjustment services during enrollment, (3) basic education services during enrollment, (4) minimal skills training during enrollment, and (5) job development and placement services near the completion of enrollment. Some of the problems identified in providing these services include: (1) the specific identification of the nature and quantity of each necessary service together with the appropriate delivery system, (2) the availability of the supportive services, (3) the difficulty of coordinating existing agencies with the new agencies, (4) the administrative problem of timing the initiation of projects with the provision of the services, (5) the conflicting standards of the Youth Corps and other groups, and (6) the rigidity of some school systems for providing a curriculum to fit the needs of individuals. Several Neighborhood Youth Corps projects where integration of services has been accomplished are discussed. (PS)

THIS DOCUMENT HAS BEEN REPRODUCED EXACTLY AS RECEIVED FROM THE PERSON OR ORGANIZATION ORIGINATING IT. POINTS OF VIEW OR OPINIONS STATED DO NOT NECESSARILY REPRESENT OFFICIAL OFFICE OF EDUCATION POSITION OR POLICY.

This paper is part of a project conducted by the N.Y.U. Center for the Study of Unemployed Youth under a grant provided by the Office of Juvenile Delinquency and Youth Development, U.S. Department of Health, Education, and Welfare to develop curriculum materials for program planners and operators.

ISSUES AND PROBLEMS IN INTEGRATING NEEDED SUPPORTIVE SERVICES IN NEIGHBORHOOD YOUTH CORPS PROJECTS

As Vice President Humphrey said when the War Against Poverty was started, "The poverty effort will require inter-agency cooperation, the likes of which this country has never seen". And the coordination cannot be entirely in Washington. It must be carried out in every city and town in the country — wherever the poverty war is being waged.

The current concern with the question of integrating necessary supportive services with Neighborhood Youth Corps work experience projects is thus, especially timely. It is a concern voiced first by the framers of the legislation; second by the Department of Labor task force which designed the implementive vehicle; third by manpower specialists with some experience with youth employment programs under MDTA, both in and outside government; and finally by committed sponsors who saw a need and sought a way of meeting it.

This paper is intended to present certain dimensions of the concern. Its charge is to present the issues and the problems involved in integrating supportive services in Neighborhood Youth Corps' projects. It is not intended to present a prescription for resolving either problems or issues. However, in following the explication of each problem and issue the reader may discover implications or directions which may prove useful byways to follow.

What follows then is an annotated "laundry list" together with a few examples of projects within which some noteworthy measure of integration of services has been achieved.

The Neighborhood Youth Corps is now one year old. It has emassed a considerable body of experience to date. No doubt it will gather much more in volume and variety as it proceeds.

In order to mount a national program of the size of the Neighborhood Youth Corps, and especially in order to reach as many youth as possible, the Neighborhood Youth Corps began with relatively "lean" projects. This leanness was not because Neighborhood Youth Corps failed to perceive the need for supportive services, but rather because it was felt that these services could and should be provided by other community resources. Unhappily also, the **necessary** nature and volume of such supportive services had not been validated.

Experience has taught us that the services are a vital part of a Neighborhood Youth Corps project. The need is most obvious in the out-of-school programs but it is no less important in the in-school projects. Experience has also taught us that these services do not appear without considerable effort on the part of the sponsor, as well as encouragement and support from the Neighborhood Youth Corps.

The Neighborhood Youth Corps is faced with a dilemma. Simply stated the dilemma is this. The need for and the cost of the Neighborhood Youth Corps basic program and of supportive services are now established. The Neighborhood Youth Corps has funds to take care of only ten to fifteen percent of the youth in the country whose poverty status makes them eligible for the basic program. If money is also spent for supportive services, the Neighborhood Youth Corps will be forced to serve fewer youth. At the same time, the Neighborhood Youth Corps continues to be an integral part of the War Against Poverty, which has as one of its fundamental principles the notion that only by an integrated attack on the many faceted enemy poverty, will it be possible for the victims of poverty to be assured the opportunities promised.

The young dropout who is sick or half-sick, cannot benefit appreciably from the Neighborhood Youth Corps work experience. He probably cannot even make it to work every day. The Neighborhood Youth Corps enrollees who cannot read or write, or talk clearly enough to be understood, will not be able to get anything but the most menial job — even though he has had the benefit of six months of Neighborhood Youth Corps work experience.

The resolution of this dilemma which seems to hold the most promise is to find and integrate supportive services with Neighborhood Youth Corps projects at the community level, wherever this is at all feasible.

What are the supportive services that must be provided? Generally speaking these fall into five categories: (1) diagnostic services prior to enrollment; (2) adjustment services during enrollment; (3) basic education services during enrollment; (4) minimal skills training during enrollment; and (5) job development and placement services near the completion of enrollment.

There may well be considerable argument as to whether these services are supportive or in fact essential and hence integral to the basic program. The current fact is that they are viewed by Neighborhood Youth Corps as supportive even though necessary in some degree in all programs.

If it is agreed, however, that the services are necessary and that they must be provided by community resources other than Neighborhood Youth Corps, what are the problems involved in assuring that the services will, in fact, be provided?

The first problem is the specific identification of the nature and quantity of each necessary service together with the appropriate delivery system. The nature and quantity part of this problem should be obvious. It includes such questions as what kind of counselling — what kind of testing and other assessment devices — what kind of adjustment services and how much of each. The delivery system problem may be stated as follows — what kind of structure and mechanism with what kind of staff is necessary to insure that the client will be supported in using the services? Traditional institutions have

designed systems which primarily support the staff in delivering services. (This is part of the fact of disadvantaged peoples not being served.)

The second problem is of course the availability of the supportive services. The Neighborhood Youth Corps has between 800 and 1,000 projects in operation at any one time. Many of them are in small communities where supportive services are simply non-existent. In the cities, generally services are there, but frequently not in sufficient quantity or quality to be of real benefit to the Neighborhood Youth Corps' enrollees. It often comes down to the necessity for the administrators of the agencies and departments offering these services to deliver the services where the funding source directs. Thus the problem of conflict in agency policy is introduced. For example, the health department may be already overloaded and understaffed. In the school extra remedial education teachers must be found and paid. Where does the money come from?

We should face realistically the problems of financing. Generally, the answers may be in the new federal programs in the fields of manpower, education and health. In the case of the Neighborhood Youth Corps this means primarily the Community Action Program and the Elementary and Secondary Education Act.

A third major difficulty is the age old one of coordinating existing agencies with the new agencies. This is reflected in the whole issue of sponsorship of Neighborhood Youth Corps projects and the relation of Neighborhood Youth Corps to the community action agencies. There is a time lag in the history that is important. The Neighborhood Youth Corps got off to a fast start; in many cases much more quickly than the local community action agencies. The Neighborhood Youth Corps sponsor often was already in operation, with his contract in his hand, while the community action agency organization was still in the planning state. Neighborhood Youth Corps policy is to encourage Neighborhood Youth Corps sponsors to coordinate with the community action agency. This is particularly necessary for the provision of supportive services. However, Neighborhood Youth Corps sponsors are sometimes reluctant to lose their identity and become what in their view is a subordinate agency of a community action group. Furthermore, it may not always be wise to insist that the sponsor become a part of a local community action agency. Sometimes either joint sponsorship or a simple coordination may suffice. The wide variety of the Neighborhood Youth Corps sponsors and the strengths and weaknesses of the individual community action agency must be taken into account. Moreover, the immediate need for assistance on the part of the target population may be the compeling important factor. (A 19 year old unemployed boy needs a job and income now!)

A fourth problem is the administrative one of timing the initiation of projects with provision of the services. If the sponsor does arrange for the pro-

vision of supportive services from other community resources, this can involve the hiring of staff, provision of space, and allocation of funds on the part of the prospective supplier of supportive service. Presumably, this should be done by the Neighborhood Youth Corps sponsor before he gets his contract. If he delays making the arrangements until after the contract is signed, weeks and probably months will pass before the services can actually be provided. In the interim, the enrollees who should be getting services are not. On the other hand, if the arrangements are made and the contract delayed for whatever reason, one faces the prospect of unproductive staff costs and disillusionment on the part of cooperating agencies.

Problem number five revolves around conflicting standards. The Neighborhood Youth Corps standard of eligibility, for example, may frighten off some groups that might be willing to provide services. They simply see themselves serving a wider group than the hard-core poor that the Neighborhood Youth Corps is focussed on. The Neighborhood Youth Corps sponsor is then caught in a squeeze and must look for some other way to get his services.

A final and very serious problem is the rigidity of some school systems. Basic to the concept of a work experience for disadvantaged youth who are attending school is the conviction that money alone is not enough to keep them in school. The program is aimed at the potential dropout who is more apt to leave school because of a personal failure and/or institutional failure than because of acute need for money. This is not to say that money is not important. We are getting considerable evidence that it does in fact make a difference with many individuals, particularly in the rural and small town areas. But the work experience must be coupled with a program designed to interest the youth in continuing his education. This involves not only counseling, but also an adaptation of the curriculum to fit the needs of the individual wherever that is possible. Many school systems have not been able to provide this kind of support as a general rule. The money made available to schools under Title I of the Elementary and Secondary Education Act makes it possible to integrate supportive services in the schools much more fully than has previously been the case. In fact, some projects have been developed where special classes will be offered to Neighborhood Youth Corps enrollees under the Elementary and Secondary Education Act.

Discussed in the following pages are several Neighborhood Youth Corps projects where integration of services has been accomplished.

The Bibb County School Board in Macon, Georgia, is sponsoring an out-of-school project for 250 actual dropouts. Macon is a small industrial city of about 100,000 which is growing rapidly. There is a textile industry there as well as electronic and aircraft plants. It is a booming town with job opportunities aplenty. The principal of the largest vocational school in the city

is the guiding spirit behind the planning and organization of the project. He has the support of the local Chamber of Commerce, and of the city government. There is evidently an historical interest in the town in vocational education — in making sure that the youth move in an orderly and systematic way from school to the many jobs in the community. There is a community action agency in the town, but it is not the sponsor of the Neighborhood Youth Corps project. However, the project is coordinated with the community action agency, and there is evidently no friction. The program involves a special educational set up, designed just for this project.

The youth will work for three hours each day; attend remedial education classes for three hours, and vocational education classes for two hours. The educational component, both remedial and vocational, are being provided by the schools. The vocational education is in such subjects as shop work, clerical courses, etc. It is geared to the job opportunities that are open in the community. The work that the enrollees do is related to the schools which provide the work stations. It includes such classifications as teacher aids, library assistants, electrical maintenance aides, auto mechanic assistants, audiovisual aides, etc. The project is planned to run for 39 weeks. It started in November and already there are marked differences in the attitudes and outlook of the enrollees. They are evidently getting a real lift from the program, which is up to full strength — one indication of the holding power of a project.

This is an example of integration of services at its best. Why did it happen here and not in other places? First, there is a real interest in the community in vocational training of youth. There is also a real commitment of all groups in the community to help disadvantaged dropouts. The fact that there are plenty of jobs makes it easier to move the youth into employment. They are very obviously needed. Another very important factor is the ability of the director to communicate and interpret the Neighborhood Youth Corps project to all parts of the community. There is an understanding of what the Neighborhood Youth Corps is doing, what the purpose is. In addition, there is an absence of agency jealousy and individualism. The willingness to cooperate had already been established. In fact, the same principal had started manpower development and training programs that are in operation in the same schools where the Neighborhood Youth Corps enrollees are working.

Another example of successful integration is in Trenton, New Jersey. There, the Plans for Progress, the community action agency is the sponsor of the Neighborhood Youth Corps project. In this project all of the enrollees get health examinations, provided through a grant to the New Jersey Health Department from the Office of Economic Opportunity. In addition, the community action agency is supplying job development for the enrollees, while remedial education is being provided by the local schools.

East St. Louis offers an interesting example of community participation. As in Trenton, the project is sponsored by the community action agency. It is an out-of-school project for 500 enrollees. It is a very poor community — a combination Watts and Appalachia — and without the job opportunities that characterize Macon, Georgia. Headquarters of the project are in a building provided by the city, and called the Neighborhood Youth Corps Center. The Youth Opportunity Center is providing the recruitment and pre-enrollment counseling services. Neighborhood Youth Corps counselors provide counseling during enrollment. The school board now offers some adult basic education classes in which Neighborhood Youth Corps enrollees participate, though the classes are not set up exclusively for the Neighborhood Youth Corps enrollees. The project will institute in the near future its own remedial education program for enrollees with space and equipment provided by the schools.

One particular interesting feature of the East St. Louis project is that it will utilize student teachers from the University of Southern Illinois which has a campus in the city. These teachers are assigned to the Board of Education and they will get academic credit for the work they do with the Neighborhood Youth Corps enrollees. The school board is providing consultants to work with the teachers. The project director expects that they will be used not only for the remedial classes, but also in the recreation program, which is carried out on school property and which has developed into an important part of the total project. What has happened is that the Neighborhood Youth Corps has sparked the development of an entire community recreation program. It is not limited to Neighborhood Youth Corps enrollees, but the enrollees get the benefit of being the core of a highly popular endeavor.

Other community agencies have also been involved in the project. The Mental Health Association and Mental Health Center provide free services to Neighborhood Youth Corps enrollees, as do the Illinois Vocational Rehabilitation Service and the Family Children Service.

These are a few examples of cases where the necessary integration of community service is taking place. There are others where the picture is not so good.

In these latter, a lack of understanding of the purpose and scope of the Neighborhood Youth Corps program, a shortage of funds, a lack of professionally trained personnel, and the difficulties of welding together different agencies and groups into an effective team constitute the main evident problems to successful integration of services. However, the solution to these problems are obviously not impossible to find. Where we have failed to design and implement a delivery system which embodies the necessary integration of supportive services the fault lies not in the stars but in ourselves.

POPULATION DATA AND COMMUNITY SELF SURVEYS FOR THE PLANNING AND OPERATING OF YOUTH-WORK PROGRAMS

With the multiplicy of federal programs providing support to the local communities in their "wars on poverty", there is an obligation for comprehensive program planning. In order to achieve this, information is needed at the local community level on the numbers of the poor, their location, and their characteristics, such as age, sex, race and nationality, occupation, income, employment, education and other population data relevant to particular programs.

The possession of such information will enable local planners and administrators to devise programs which fit both the numbers and the needs of the prospective participants. For those responsible for the carrying out of youth programs—the principle focus of this paper—information on the target population (the out-of-work youth between 16 and 21) makes it possible to plan more appropriately for job slots as well as for the particular needs of this special group of clients. Without such knowledge there have been communities embarrassed by their inability to fill all of their available openings or slots. On the other hand, there have been communities equally embarrassed by their inability to cope with unexpected numbers of youth seeking work and training opportunities. More important, with rising employment levels, is the need to know more about the residual, hard-core group of the especially disadvantaged and unemployed youth.

For example, in one community, there were only nine trainees available for the 45 slots for auto service station mechanics, for 30 clothes pressers only one youth, and for all 490 slots for trainees, only 138 available trainees could be located.[1] This is not necessarily the fault of local planners and administrators. Presently, there are neither guidelines for obtaining such information nor readily accessable data for most communities in the United States. Consequently, the ability to develop comprehensive youth-work and training programs is limited without data describing the target population. With such information not only is it possible to avoid such embarrassements, but also to develop comprehensive programs and to plan the proper "mix" of these programs. How many local youth are in need of Job Corps, Neighborhood Youth Corps, OJT, MDTA, or other programs? What combinations and amounts of supportive services will be necessary for each of these programs? Will sixteen year olds require different provisions than 18 year-olds? Will

1 Baltimore Sun, Jan. 11, 1966.

the hard-core unemployed, the delinquent or the minority group youth require special programming? If so, for how many and in what areas of the community?

That such information is hard to obtain was testififed to by the recent Workshop on youth-work programs[2] where program planners and administrators from cities in the northeast region indicated they had only crude estimates of the number of unemployed youth aged 16-21, and beyond that very little other knowledge about their programs' impact on their target populations.

For some federally supported programs target information data are desirable but not required, but for other programs—particularly Title II, the Community Action Program of the Economic Opportunity Act—such data are legally required. Usually, data derived from the 1960 Census will suffice to meet requirements. But for reasons to be discussed below, comprehensive programming for youth-work programs requires data both more current and more relevant than that found in the last available census. Such programming, in order to be both comprehensive and applicable to the needs of the clients, would require minimally the following information:

1. Number of youth in the community, 16-21, with breakdowns for each age and sex.
2. Number of unemployed, out-of-school, 16-21, for each age and sex.
3. Number of in-school youth, 16-21, for each age and sex.

(These data provide the baselines for estimating the dimensions of the problem as well as for calculating unemployment rates, trends, and information which could be used for monitoring the effectiveness of the programs. While the focus of this paper is on data gathering for the purpose of program planning and administration, the same data, or modifications, could have other purposes, such as for recruiting, monitoring or evaluating program impact at a later date.)

The following data should be collected where possible, for the out-of-work, out-of-school youth, 16-21.

4. Educational attainment, including literacy level.
5. Race.
6. Nationality.
7. Geographical location or residence.

2 "Summary of Proceedings: Workshop on Problems of Planning Recruitment and Selection for Youth-Work Programs," Center for the Study of Unemployed Youth, New York University Graduate School of Social Work, Nov., 1965.

8. Family income and source, i.e., social security, general assistance or public welfare.

9. Median rental in areas from which unemployed youth come.

(This information is necessary not only to identify and describe salient characteristics of the target **population,** but also to locate target **areas.** A knowledge of target areas is useful in planning the location of "intake" centers where clients can be contacted, a preliminary assessment of need made and recruitment undertaken.)

Beyond these data it would be more than useful to have such descriptive information on the target population as:

1. General scholastic achievement of out-of-school, out-of-work youth.
2. Aptitudes, interests and abilities of the target population.
3. Language handicaps or limitations.
4. Minority group status.
5. Previous work experience.
6. General health status.
7. Attitudes and motivation toward work and training.
8. Delinquency patterns.
9. Residential mobility or stability patterns.

Source of Data

Assuming the importance of such data, what are its sources and how accessible are they? How accurate, up-to-date and stable are they? What is the cost, time and what are the modifications or adjustments which will be needed? Data gathering is not the main focus of programming. It is only a resource. As such, wisdom and common sense need to be exercised in allocating the appropriate time, cost, and attention to their collection. Three sources and methods will be discussed:

1. U.S. Census and Bureau of Labor Statistics
2. State and local community sources, public and voluntary
3. Community self-surveys

I. U. S. Census and Bureau of Labor Statistics

These are the two major sources of unemployment and poverty information in the United States. The problem their use presents to the program planner is best indicated by Commissioner Ross of the Bureau of Labor Statistics who stated: "One thing that has troubled me is that we don't know how many unemployed people there are in the Watts areas of Los Angeles . . . that indicates that while we have excellent figures on a national basis, we do not have the detailed coverage for areas and occupations we should have when we get down to the hard-core of social problems."[3]

The basic census materials for program planners at the local community level are the Censuses of Population and Housing, 1960.[4] These provide data by census tracts for all tracted areas in the United States for numbers, sex, age, income, source of income, occupation, education, median rental, race, ethnicity, unemployment, migratory status and information on residential stability. For some thirty-six cities and a possible 150 more, a separate series, "Income, Education and Unemployment in Neighborhoods", is available.[5] Similar data to that of the 1960 census are included with the addition of "poverty" indices and maps showing those census tracts with the highest composite rates of low income, education and employment. For the cities where this is already available this can be a very useful resource. For the cities (or counties or metropolitan areas) which have not had the series completed, this can be done at modest cost by request to the Census Bureau.

With all data derived from the 1960 census there are several qualifications or limitations which need to be kept in mind. The first is that for many cities the data, now six years old, are outdated. Significant changes in births, deaths, out-migration or in-migration may have occurred. Urban renewal or other changes in land use may have emptied sections of the city or replaced them with residents of different characteristics. Finally, although population levels and age distribution may be similar to those of 1960, displacement or replacement of previous residents by new populations may result in areas of the city having quite different characteristics, such as more recent rural migrants, different language, or higher rates of delinquency and illegitimacy.

Barring major population shifts from the 1960 census, such as demolition of poverty areas for freeways or replacement by higher rental apartments, its rough estimates of numbers of impoverished families and individuals must suffice in lieu of more recent data. It should be remembered,

3 The Christian Science Monitor, Jan. 13, 1966.

4 U.S. Dept. of Commerce, Bureau of Census, Final Report PHC(1)-83, pt. 2

5 U.S. Dept. of Labor, Bureau of Labor Statistics, 1963.

however, that turnover rates from 50 to 200 percent per year have been reported for target areas in some cities. On the other hand, special censuses conducted for several cities in 1965 show only a ten percent increment since the 1960 census — a change acceptable for most program planning purposes.

How, though, are program planners or administrators to know if any major changes or shifts have taken place? Without the undertaking of a special census or survey there is no sure way. Where there is reason to believe that major changes have occurred, youth-work program administrators can request elected officials of the community to contract with the Census Bureau to undertake such a census — which, however, will not be reported in the same detail as the 1960 census. Also, unless specially contracted for, enumeration is not reported by census area or tract as in the regular census. However, many communities, particularly those losing population, will not wish to have a special census undertaken. In such cases it is possible for youth-work program administrators to contract for a special census of a **part,** not the whole, of a given community. Depending on the size of the area to be surveyed, the approximate number of persons and the complexity of the data, cost will range upward from about twenty-five cents per interview. Information about these special censuses may be obtained from the regional offices of the Bureau of the Census, U. S. Department of Commerce. The surveys usually are completed in five to six weeks.

While there may be less advantage for program planners to use the census tract as the base, it has added value for the administrator who may wish to use census tract data as one of the units for measuring change which could have been induced by the program. An increase, for example, in average educational attainment, employment rates or family income between 1960 and after the program has been in operation, may, with careful qualifications, be a measure of program impact on the area.

The "Monthly Report on the Labor Force", which is the official nationwide report of employment and unemployment trends, does not report on local unemployed youth. Estimates of unemployment are made for labor market areas, which encompass the larger cities in each state as well as the satelite communities surrounding them. There is no breakdown for these areas by age, sex, or sub-section of the city, such as in the 1960 census tracts, so that comparisons and trends with the 1960 census data are not possible. The Monthly Reports also tend to systematically underestimate the number of unemployed youth through inadequate sampling.

It is apparent, then, that federal sources are limited, have many in-

adequacies and tend to be outdated. In view of the billions expended for programs aimed at the reduction of poverty, it appears paradoxical that the federal government—the principal funding agent of these programs—permits itself to be so handicapped. Without more accurate information at the local level, where the encounter with the disadvantaged, unemployed school drop-out takes place, program planning must suffer not only at the local level but at the national level as well.

II. State and Local Community Sources — Public and Voluntary

While there will be variations from state to state and between local communities, the resources cited below are usually available:

1. State Development or Economic Commissions or Boards. While these differ from state to state, many will have detailed and comprehensive data with particular emphasis on hardship areas, i.e., areas of chronic and high rates of unemployment. The particular mission of such groups is usually to attract industry, trade, and commerce to areas of high unemployment. While there will usually be population projections for the next several years, there will also be considerable information on trade areas, transportation facilities, power resources, labor force potential, financial inducements and natural resources. Their particular value for the program administrator is as a possible placement resource for newly trained youth with newly located industry. By knowing what the possible labor force requirements of a new industry might be, appropriate youth training programs can be established.

2. University extension departments, departments of rural sociology, agricultural economics or urban research centers are another source. In many states land grant universities have extensive data banks describing in fairly complete detail population and area characteristics for large segments of the state, particularly for chronically depressed and rural areas. This will frequently be the most complete, if not the only, source of data available for the smaller community and the rural hinterland. Some states have detailed descriptions of every county excepting the large urban counties indicating levels of income and occupational status, educational attainment, housing, race, and market area data.

For the smaller communities, there often is available a wealth of knowledge of employment resources, local attitudes and traditions, and frequently attitude surveys of teenagers. These university resources may also be called upon to undertake special surveys or studies, either on a contractual or cooperative basis. In a considerable number of states there have been detailed studies of migratory workers and their children.

Urban research centers of universities, on the other hand, focus their research and survey activities on the larger metropolitan complexes. These centers are fewer in number than university resources studying rural areas, but where they do exist, they can be invaluable sources of data on demographic and population changes. They conduct frequent surveys on a sampling basis of attitudes, behavior, housing characteristics, migration patterns, and, in many cities, continuing ecological studies. The latter can be useful to planners in locating target areas where services should either be located or intake centers established. In allied departments of sociology there usually will be data on delinquency patterns and distribution for many cities, with spot mapping available to show areas of highest delinquency.

3. State departments of education, welfare, health or youth services can often provide considerable information on a local community basis. Although their annual reporting is usually state-wide, it is sometimes possible to obtain information on a particular city or town. This frequently will include case finding and diagnosis of problem and handicapped youth, unwed mothers, delinquents, and incidence of venereal disease on a local community basis. Such information may help to identify target areas as well as the hard-core of the disadvantaged youth. Some state youth commissions have survey teams able to undertake special surveys at the request of the local community.

4. Local health and welfare councils exist in most middle size or larger cities in the United States. The larger cities usually have research departments as a part of the council operation. Most have accumulated over the years a vast amount of demographic, population, ecological and housing data while serving as a repository for agency service statistics and delinquency information. Through their youth services or group work and recreation programs there will be information on leisure time resources, camping facilities, and other recreational activities. Any number of surveys of needs and resources for youth will have been undertaken over the years. In most cities this is probably the one place where the largest amount of data are available which have relevance for program planning. While much of the data would serve primarily to delineate target areas, a considerable proportion could be used in program planning where particular supportive services may be useful. The main value of community health and welfare councils, however, lies in the extensive nature of data collecting around the general area of social pathology.

5. City planning departments exist in most cities in the United States. If there are current estimates of population, housing characteristics and a

knowledge of any major physical changes which have taken place in the community, such information will most likely be with such departments. Many have conducted surveys of skid-row areas, inadequate housing, and changing land-use patterns over time. However, there has been limited experience on the part of city planners in collaborating with social scientists, social workers, and others outside their discipline. The best detailed maps indicating various characteristics of the area, both for the present and projected for the future, will usually be found in such departments. Urban renewal and relocation plans are also usually available together with a knowledge of industrial or commercial growth and changes. These data are more generally useful for describing target areas rather than for individual or group characteristics.

6. School departments can be the most fruitful source of information on the teenage population, dropouts, scholastic achievement, psychometric data (including test information on aptitudes, abilities, interests) and health information for all those youth who have been in the system. While school districts and boundaries do not usually coincide with census tracts, it is possible for program planners to make adjustments which approximate census tracts. School boards, especially in larger communities, will have research departments, one of whose functions is to estimate current and projected populations for each school grade. With corrections for dropouts these will provide estimates of teenagers in each "adjusted" census tract. Using 1960 census tract data as a baseline, it becomes possible to estimate rates and levels of population changes. There will be an under-estimation because of the in-migrant youth who are above minimum required school attendance age are frequently not in school. However, the most important use of school data lies in the fact that the school is the only social institution which has contact with all youth; which is the repository for official records, data, trends and personal data; and which also can be an invaluable resource for learning local community attitudes and teenage culture. The local school principal and his faculty who are sensitive to the local school community and its traditions can frequently be of assistance to a program planner or administrator.

Where the individual candidates for work or training programs have been in recent attendance, classroom teachers can also be an additional source of information regarding group attitudes, dress and behavior, and an appraisal of potential which may not have been demonstrated either in scholastic achievement, placement or achievement tests, or in other psychometric devices. Insofar as school data are concerned, there may be a considerable volume of information which could be used to describe the dropout, particularly if they had been within the same school system for a period

of years. But it should be realized that, especially for the "hard-core", hard-to-reach client, such records may provide a distorted and biased picture. Generally, such records will systematically tend to under-estimate capacities and over-estimate the negative and culturally dysfunctional aspects of such youth.

7. Public health departments, community mental health clinics, and hospitals can be a source of information on health problems of the target population (some studies have shown that as many as fifty percent of the applicants for youth-work programs require medical service) and also indicate target areas with a high concentration of venereal disease, tuberculosis, mental illness and other indicators of poverty.

8. Police, family and juvenile courts, probation and parole officers are an additional source for identifying and locating certain groups of the "hard-core", delinquent or pre-delinquent youth. The program planner will need to know the numbers of such youths, what their attitudes toward work programs may be and what special problems of addiction or aggressiveness the group will present. Consideration will have to be given to the idea of "balance", that is, of planning the optimum mix of these groups with the more tractable and amenable groups in the program. Too heavy a weighting with this special "hard-core" group would probably impose extra difficulties on the whole program and subject it to increased risk of failure.

9. Youth from families on public welfare or general assistance should automatically be identified as members of the target population. In particular, youth from families on AFDC or AFDC-UP (Aid to Families with Dependent Children-Unemployed Parent), the largest of the federally supported welfare programs, by reason of being on public support are one of the major target groups of the poor. Recipients of aid from Childrens' Aid Societies or other child protective agencies are also usually members of the target population due to their dependency or neglected status.

Program planners can learn something of the nature of family backgrounds and problems of this largely "mother only" group. Case workers assigned to such families (many welfare agencies have a special services unit for the multi-problem or "hard-core" family) can brief programmers on the characteristics, deficits and capacities of this segment of the target group.

Of particular value to the program administrator are the supportive services which are often available from such agencies. Under the provisions of the recent medical aid bills, for example, it is possible for youth in such families to receive medical services under the aegis of the local public wel-

fare agency. It may also be possible to place trainees under Title V, Community Work and Training Programs of the Economic Opportunity Act, which are administered by the local public welfare agency and supported by funds from the Federal Bureau of Family Services. Public welfare agencies may also be used as sources for trainee placement under the Neighborhood Youth Corps and eventual employment for some in these agencies, either as indigenous aides, clerical or custodial staff, or case aides.

10. Local draft boards should also be a source of target group information. With rejection rates running as high as forty percent for both psychological and physical disability, program planners will need to know the kinds of impairment which handicaps this group in order to plan appropriate supportive services. Most of these youth are from economically and culturally handicapped families.

11. The Urban League, NAACP and CORE, through their local chapters, can be the principle means of indicating both the numbers and the employment status of Negro youth. There are growing indications that the established networks of agencies and services have not been successful in meeting the needs of this segment of the target population.

12. The AFL-CIO Community Services programs which exist in most larger communities are less a source of information on target youth than they are a potential source of support for the developing of apprentice training programs. Programmers need to know not only the numbers and characteristics of the target population but also need to have slots in which to place such youth either for training, work experience, or employment.

13. There are a number of private research organizations specializing in social welfare research and surveys. While most of their head offices are in New York they contract to undertake welfare surveys and studies all over the nation. Their fees may be higher than many youth program directors are able to afford, but they will undertake any study the client may wish.

14. Perhaps the most important resource for information on target groups are the State Employment Services. While there is considerable variation in their ability to relate to all groups of disadvantaged and deprived youth, they remain the principal agency for providing employment and related services. And where State Employment Services have a special youth services program or have established a Youth Opportunity Center they can become a major resource to planners and administrators.

Information on unemployed youth registered with local SES offices is available on a monthly basis, often including age, sex, major courses studied in school, and previous work history. The General Aptitude Test Battery in

most instances will have been administered, providing program planners with estimates of general learning ability, verbal aptitude, numerical aptitude, motor coordination and manual dexterity.

Where YOC's have been established, additional testing results can be made available. The Metropolitan Achievement Test, both elementary and intermediate level, is an additional tool for estimating verbal and numerical attainment. For youth with low verbal skills, language deficits or the culturally deprived, the IPAT, supposedly a culture free test, is administered. Some YOC's will have additional information on family characteristics which will indicate the nature of the home conditions of the unemployed youth. While the main purpose for establishing these testing programs has been for individual counselling, program planners, by obtaining an assessment of group characteristics, can build training and work programs around the strengths or capacities of target populations.

The full utilization of SES resources, obtained either from their special youth services branches or their Youth Opportunity Centers, could result in a fairly complete delineation of the target population and its characteristics.

Generally speaking, most of the above agencies having target population data will make them available on a group basis. It should be kept in mind that there will be considerable overlap of information since many "hard-core" clients and their families may be receiving services from a variety of agencies.

III. Community Self-Surveys

Recognizing, however, that not all unemployed, out-of-school youth (particularly many minority group youth, "hard-core", or seriously deprived, delinquent or impaired youth) will register with established employment or welfare agencies, program planners should utilize other means to obtain additional estimates of the target population. One which particularly recommends itself is the community self-survey directed toward the target area of a community. Faced with the limitations of the 1960 census, the unavailability of current unemployment statistics for their local communities, the generally limited and incomplete nature of other estimates of the target population, and the limited budgets of most programs, youth-work planners can initiate their own community surveys.

One possibility is to utilize VISTA personnel, particularly those who may have had allied skills which could be transferable to the kinds of activities which would lend themselves to carrying out a survey. In most cases, since such personnel will rarely have skills adequate to planning a survey, ques-

tionnaire or schedule construction, and a knowledge of interviewing, it would seem almost necessary to have research consultation for these activities while VISTA personnel would largely carry out the interviewing.

A second possibility is the utilization of local volunteers. For example, some projects have used selected and trained members of the American Association of University Women for such interviewing with salutary results. Again, it would be desirable to have local university or college consultation for sampling design and schedule construction.

A third and final method for undertaking a local community survey is through the utilization of indigenous personnel, which a number of communities have done. Where indigenous youth are to be used for interviewing or in other survey components, there may be problems of low reading and writing skills. In one project is was found that most of the youth were unable to read beyond the fifth grade level. Where this is the case additional training time will have to be provided for the purpose of reviewing the schedule, practice interviews and practice recording. Also, it will be necessary to adjust the level of sophistication, complexity or difficulty of the interviewing or data processing to the limitations of the interviewers.

In order to determine the advantages and disadvantages of a number of different methods for undertaking such a survey, the survey programs of three cities were observed. Utica, New York, a city of 100,000, carried out its survey with some 80 Neighborhood Youth Corps youth conducting the interviewing. Hartford, Connecticut (162,000) used 50 to 60 interviewers from the professional staff of the State Department of Labor while Port Chester, New York (25,000) used about 40 volunteers, largely from local colleges or middle class areas of the city.

In addition to data gathering, there were additional purposes for conducting a survey in each of the three communities. In one it was to provide a socialization experience as part of a work training program for culturally deprived youth. It was also to provide many middle class residents, who were also surveyed for comparative purposes, contact with low income and minority group youth.

The Hartford survey had as its purpose case finding of the unemployed and under-employed as well as their recruitment into job training programs. Incidentally, in the high poverty area where the family by family survey was undertaken, 1,771 new unregistered persons sixteen and over needing employment were found—about 1 out of 4 persons interviewed.

Port Chester, like Utica, sought to use the survey as a means of obtaining community support for programs which initially were either not

understood or were opposed by the non-poor of the community. However, instead of sending the poor out into the community as Utica did, it sent the middle class volunteer interviewers into the areas and homes of the poor.

Administrators, then, were able to use community surveys for purposes in addition to obtaining enumeration counts of the poor. Thus, program operation often preceded program planning, which in turn could not always wait for the development of current survey data. While it is obvious that human needs must have priority over planning and data gathering, in the long run administrators would find their programs far more defensible to the degree that these programs validly reflect the current needs of their communities.

1. **Purpose:** Should a neighborhood household survey be focused primarily on the 16-21, out-of-school, out-of-work youth? What about persons sixty-five and older, the under-employed, the parolee, addicted, mentally retarded or mentally ill, mother-only families or single adult unemployed — should they not also be counted? In part, the emphasis of a survey will reflect the interests of particular agencies as well as the needs of the population they serve. However, since poverty is a community problem as well as an individual one, the wiser strategy suggests as broad a coverage as possible. Although many surveys will probably be carried out by enrollees of the Neighborhood Youth Corps, information gathering should go beyond the needs of youth. Youth, for the most part, are in families which have an array of problems resulting from poverty and who live in high poverty areas with inadequate, inaccessable or unavailable services. Program planning, development and administration for the poor requires a broad survey for **all** the poor rather than for a special target population.

However, local program planners and administrators using non-professional staff would be well advised to confine such a neighborhood survey to obtaining an enumeration count of the population in target areas by age, sex, ethnic group, employment status, family size, educational attainment, number of rooms in residence, length of time in residence and possible interest in some of the programs such as Project Headstart, Neighborhood Youth Corps, Youth Opportunity Centers, Medicare, Job Corps, etc. On questions of employment status one should expect only a crude approximation of the true condition.

(Where estimates for various pathologies listed above are needed for program planning, it is suggested that recourse be made to those sources for data gathering described on pages 8-13.)

Regardless of which particular agency, project or program may be physically carrying out the survey, a more adequate description of needs and

resources can be obtained if such surveys are carried out under the general auspices of the local Community Action Agency. By so doing, there is greater assurance that the interests of all the constituent agencies and of all the client groups will be more adequately represented.

The primary purpose of the survey, then, should not reflect the needs of a special interest program or agency but should be directed towards a broad description of the needs, interests, abilities and resources of all of the poor, disenfranchised and disadvantaged in the poverty areas of the community. (It becomes too costly and needlessly comprehensive to survey all households in communities of 50,000 or over. Where such a city-wide survey is desired, sampling procedures should be used. These, however, add considerably to the complexity and technical difficulties of such a survey.)

Secondary purposes such as involving the non-poor in enriching experiences, exposing the poor to wider segments of the community, or developing a public relations program for inculcating more favorable or sympathetic attitudes toward the war on poverty, need to be approached cautiously. In the Hartford survey, for example, no publicity on the survey was provided to the mass media until it was completed. It was believed that premature publicity was too unpredictable in its impact on the clients to be interviewed or on civil rights groups who might have been concerned about invasions of the right to privacy. There was also some concern that wide, pre-survey publicity could encourage irresponsible or criminal elements to exploit the situation by posing as "interviewers" and gaining access to homes.

A part of the primary purpose should be to obtain data descriptive of target areas as well as target populations. What agencies or services are available in local pockets of poverty? Is there an outreach station for the State Employment Services, what about Youth Opportunity Centers, Neighborhood Youth Corps, Health Centers, and other services? What are the transportation facilities? Do they provide ready access to local job markets? Is there adequate police protection, waste removal, rodent control, legal protective services for tenant victims of slum landlords? These are all a part of the story on poverty.

2. **Staffing:** Generally, the proposed or estimated number of household interviews will determine staff size and composition. Regardless of the size of the activity, the experience of the three cities strongly suggests the need for experienced professional staff persons to be in charge of the project. The experience with indigenous non-professional personnel indicates that their most effective use is at the team or "street" level of supervision.

Supervisors, who may be non-professional and/or indigenous, are necessary to accompany teams of interviewers as they enter the area to be surveyed. Where Neighborhood Youth Corps trainees are used as interviewers, the Utica experience points out the value of indigenous supervisors who were able to anticipate some of the potential sources of awkwardness or "non-professional" behavior on the part of individuals on the survey teams. Their knowledge of their own communities also proved an asset since they were able to assess the temper of the local community as well as to act as a communication bridge between the program and the poor. There is always the danger of divided loyalty of the indigenous leader[6] who may become too separated or too alienated from his own people if he over-identifies with the program. The Utica experience of using one supervisor for thirty-six interviewers was found to be inadequate. The optimum arrangement, where interviewers are going in pairs, is one supervisor for six pairs.

If the schedules are designed to ordinarily take less than thirty minutes to complete, and where either indigenous or volunteer interviewers are being used (the error factor increases with increased length and detail), a team of twelve interviewers working in pairs with one on-the-street supervisor may expect to complete an average of twenty-five to thirty interviews per day. The Hartford experience found that about one fifth of the interviewees were not at home at any one time.

The advantages of using volunteers over Neighborhood Youth Corps, Community Work and Training Program (Title V) enrollees or other indigenous groups are that there is no cost involved, and their time contributed may be used as the "in-kind" matching share of the local agency's contribution to federal grants. In addition, they are easier to train, are more presentable and acceptable to the community at large and can interpret the needs of the poor to a broader constituency.

Their liabilities are that they are not always easy to recruit and once recruited are not always available when needed. They cannot be assigned the same work over an extended period of time as a paid worker, and their personal or family activities frequently receive higher priority than a volunteer assignment.

The experience with paid staff indicates that many of the above objections are overcome. They can be counted on to fulfill schedules and assignments, and their dropout rate is lower. (For both Utica and Hartford where Neighborhood Youth Corps and State Department of Labor staff were used,

6 See Levinson, Perry and Schiller, Jeffry, "The Indigenous Nonprofessional-Research Issues," Research Working Paper No. 6, Welfare Admin., Division of Research, Dept. of H.E.W., Washington, D. C., 1965.

there were no dropouts). While there is less interpretation of the total program provided to the larger community, communication and interpretation of the program and of the special interviewing project can be facilitated at the local level by using indigenous agency staff. Where some of the volunteer interviewers were repelled by the conditions encountered in some of the homes of the poor, this was less the case with youth from the local Neighborhood Youth Corps.

The disadvantage of paid staff, of course, is cost. Funds for undertaking special surveys are generally not available, either from local or federal sources. To use some sixty youth from the Neighborhood Youth Corps as Utica did, would require a grant in the order of $50,000. This will not cover all of the expenses involved as such a grant is primarily for work training. Additional expenses such as card punching, computer programming and research consultation, unless they are a part of work training, would have to be budgeted from other funds.

Where it is possible to obtain funds to carry out such a survey, administrators will probably find that the advantages of paid staff outweigh the disadvantages. Volunteers can be used in other capacities in less vulnerable projects.

3. **Consultation:** All of the cities could have benefitted from expert consultation on the design, construction and pre-testing of the schedule to be used in the household survey. Schedules or interview forms suffered from being too lengthy, unclear with ambiguous items, from open-ended interviewing (which led to the problems of reliable recording and coding), an absence of pre-coding of the responses to the questions, and a format which made it difficult to easily card-punch. When between 1,000 to 6,000 schedules with thirty to fifty items were used, the data processing difficulties, unless set up for computer beforehand, become obvious. One other limitation should be mentioned. Questions, were often framed in such a way that the responses could not be compared, for example, to age distribution or income in the 1960 Census or to other possible base lines.

The regional and local offices of the Census Bureau usually have available lists of local consultants who might be available for such purposes as design and construction of the schedule or interviewing instruments. Faculty in most sociology departments, instructors of research in schools of social work, market research specialists, local health and welfare council researchers and staff in city planning departments or research departments of larger city school departments are often also available as consultants.

Many other specialists might be profitably used on a consulting basis,

but the program envisioned here is for the smaller cities with limited budgets and few specialized personnel.

4. **Questionnaire or Schedule Construction:** While consultants may be of assistance in designing the survey, the kinds of information sought must be decided by planning and program directors. Given this information consultants can then structure the interview form properly, pre-code it, and set it up for future computer tabulation if necessary.

In an "omnibus," multi-purpose community inventory and household survey, other agencies, programs, and projects in the community may wish to include questions relevant to their activities. Where possible, as many agencies as feasible should be given such an opportunity. This is advisable not only for the sake of community relations, professional courtesy, and inter-agency cooperation, but also because of the possibility that two heads are better than one and that the danger of an oversight or omission of important or needed data is thereby reduced.

Apart from the customary items such as age, race, sex, education, income, occupation, source of income, median rental, and family size, there should also be items on voter registration, literacy levels, bi-lingualism, rent violations, interest in training or work programs, and school dropouts.

5. **Interviewer Training:** The purpose of training should be not only to teach the rudiments of interviewing procedure but also to develop familarity with the interview instrument. The interviewer should have sufficient confidence in his ability to manage the flow and order of questions so that he will be able to devote considerable of his attention to establishing rapport with the respondant. To the degree the respondant can be given a sense of assurance that the information he gives will be treated confidentially and responsibly, to that degree the interview situation gains in credence and significance.

Training should also incorporate the induction of an appropriate set of attitudes toward the survey task, particularly where indigenous personnel are to be utilized. They must have a sense of the ethical responsibility such an assignment entails. Constantly to be reiterated is the requirement of confidentiality of the data: the rights of the clients — the respondants — must be assured and protected. Also to be instilled in the indigenous or other interviewer is a sense of the utmost need for the integrity of the data. Its accuracy and honesty must be assured and protected.

The training period should be organized on a formal basis with a schedule, agenda, curriculum and appropriate professional instruction. It should include a discussion as to the overall general purpose of the survey

as well as an indication of the purpose and value of each item on the interview schedule.

Practice interviews should be held between the trainees with the instructor commenting appropriately. This is best done one pair at a time before the class so that all members of the project staff can visualize the interviewing process. All the interviewers should play the role of the person being interviewed as well as the role of the interviewer, so the advantage of using a pre-coded schedule as against one requiring written responses will become apparent. Since the use of indigenous personnel suggests the possibility of limited literacy skills, there should be assurance that all are able to read the questions and instructions.

After several sessions of practice interviews there should be several practice interviews in the field. These should be followed by staff meetings with a review of the problems encountered. Some of the inadequacies and unforseeable limitations of the schedule may be learned at this time and it usually will be necessary to make a number of changes.

A suggested training agenda might be the following — with no implication that this is a preferred model:

First Day:	Screening, testing and interviewing and selection of candidates.
Second Day a.m. session:	Orientation of candidates to project by project director. Distribution of schedule, definition of boundaries of area to be surveyed. Group discussion on expectations of dress, behavior and language.
p.m. session:	Introduction to appropriate Community Action Agency or project personnel, board members and public officials, carefully selected so as to not impair usefulness of indigenous trainees by being too closely identified with symbols or spokesmen of the "establishment".
Third Day a.m. session:	Review and analysis of the schedule.
p.m. session:	Practice interviews.
Fourth and Fifth Days:	Continuation of practice interviews. Role playing, especially if there are to be female interviewers or interviewers of a different race than the respondants, on what situations to anticipate and how to handle them.

Sixth and Seventh Days:	Practice interviews in the field by pairs.
	The last part of each day's interviewing should include a full staff meeting with a report on difficulties encountered and their possible solutions.
Eighth Day a.m. session:	Discussion of any changes made in the schedule, assignment of routes, designation of sample, distribution of material, instructions for checking in and out, and procedures for turning data in at the end of each day and on call-backs.
p.m. session:	Survey commences. Supervisors in the field with their assigned teams. Project director remains at office base to answer queries from police, area residents or instructions to supervisors on handling any special questions or problems which may emerge.
	As data begin to accumulate, the second phase of job training may now be developed for card punching. File clerking and data processing with an IBM counter and sorter, if this is available.

6. **Data Processing:** As previously indicated, in those communities where special or expert consultation had not been utilized, it became very difficult if not impossible to process the data from the schedules. Where open-ended interviewing has been used it is quite unlikely that several thousand responses of one or more paragraphs to each such structured question will ever be coded and analyzed. A good rule of thumb is to require justification for each question or item in the interview schedule. Who wants the question asked and why? How does he propose to use the answer? How will it fit in with the basic purpose of program planning, development, administration or evaluation?

Only if each item or question can meet these criteria, and if it can be asked simply and coded easily, should it be considered for inclusion. By so doing, project directors can facilitate and expedite the processing of raw data from the schedules.

All data processing, tabulating or counting should be repeated once over. Inevitably discrepancies will occur between the two counts and these must be rectified. Double-counting provides assurance that all errors have

been identified and corrected as well as providing job training in "market research" for the staff. This should include IBM card punching, which will provide a check on punching accuracy. Where there are differences between the decks, reference should be made to the original schedule to verify the correct punching.

The success of data processing, then, is first contingent on the expertise in which the schedule format was initially layed out. The second condition for ease and facility for processing is the design of the summary tables, which show the distribution of pre-coded responses to each item in the schedule. It would be wise to have these laid out in advance where consultation is available. Summary tables should present the findings not only by gross counts but also by percentage distribution of respondants for each possible response to each question.

Where manual procedures must be used, the general experience suggests work in pairs — one person calling the response to the item and the other recording the response on tally sheets.

7. **Writing of the Final Report of the Survey:** Unless the findings of the survey are brought together into a final report they will lose much of their value and utility. The report becomes the tangible evidence of the fulfillment of the project.

Generally speaking, the final report should be a straight forward statistical summary of the findings written by a senior staff person or consultant. It should contain a statement of purpose, a list of the participating agencies, the source of financial support for the survey, statements of appreciation to cooperating parties or organizations, the findings presented in tabular form and finally a copy of the interview schedule and other relevant documents.

8. **Distribution and Utilization of the Report:** Depending on the size of the community it is usually advisable to publish several hundred copies of the report. For this reason it is perhaps wiser to mimeograph rather than duplicate as it is also often necessary to supply additional copies at a later date. Copies should be distributed to all participating and co-operating agencies, to the press, and to other interested community organizations. All of the project staff should also receive copies.

If the project was carried out under the auspices of the local Community Action Agency it should convene a workshop or conference on the report in order to formulate program startegies suggested by the survey findings.

If the survey was under the auspices of the local Neighborhood Youth Corps, Youth Opportunity Center or other agency, a workshop, conference or institute might also be conducted but primarily to impart information to invited agencies.

Above all, the agencies, programs or projects most directly involved should conduct a review session for their own planning and administrative staff in order to ascertain the program implications for their own agencies. Without such a special effort the findings of the survey may be neglected and have no impact on action or program.

Particular concern should be paid to the survey findings as they relate to the type and extent of programs for various target populations. Are they broad enough to provide opportunity to participate for most of those in need and eligible or, as has happened in a number of communities, are there too many slots for the available number of clients in the local community? In any event, as charges that Project Headstart is not engaging the very poor persist, or as the Neighborhood Youth Corps is admonished to reach out more aggressively for the uninvolved hard-core dropout, program administrators, if they choose, will find the survey an invaluable tool in knowing where their poor are, how many there are, and what their needs are.

9. Do's and Don'ts of the Community Survey

1. Limit interviews to thirty minutes.
2. Alert police, Chambers of Commerce, Better Business Bureaus, and mass media **before** the survey.
3. Alert people in area to be covered with circulars placed under doors — not in mail boxes.
4. Survey supervisors should accompany teams into survey areas and should know whereabouts of female interviewers.
5. Carry identity cards, clip boards, portfolios, flashlights, extra schedules and pencils with erasers, not pens.
6. Where family is not at home leave a card indicating when next call-back will be made. Make at least three call-backs.
7. Where cases of need or crisis are uncovered, notify appropriate agency as soon as possible. Give such persons instructions, telephone numbers and directions for reaching appropriate agency or agencies.

8. Conduct staff review meetings weekly to discuss problems, questions and issues which arose during week.

9. Pre-code all questions. Avoid open-ended questions.

10. Expend extra efforts in locating the single unemployed males, particularly the 17-18 age group.

11. Questions on income and source of income evoke sensitive responses, particularly where income may be low or derived from public welfare. One way to handle questions on income is to present a card with a range of income and sources, and ask for an indication of category.

12. Interviewers should be instructed that they are not allowed to drink while on the job.

13. Completed interviews must be turned in at the end of each day.

14. One way to insure confidentiality is to assign a numerical code for each interview. The code sheet containing the name of the interviewer and its code number should be placed in a vault for safekeeping.

*YOUTH PROGRAMS; *RURAL YOUTH; *COMMUNITY ACTION; FEDERAL PROGRAMS; *UNEMPLOYED; *COMMUNITY ROLE
COMMUNITY ACTION PROGRAM; CAP

Youth is defined as that segment of the population between the ages of 15 and 24. This definition includes 24 million persons, or 13.4 per cent of the population. Of this number, 7.5 million are rural and 1.8 million of the rural segment are farm youth. The unemployment rate for teenagers in 1965 was 13.1 percent for males and 14.3 per cent for females--the largest category of unemployment by far. The manpower problem of rural youth differs from that of urban youth, and it is to this point that this paper speaks. Based on the 1960 census, the Department of Agriculture indicated that, of the 16 million persons thought to be in poverty, almost half of them were in rural areas. The need for a Community Action Program (CAP) is discussed. The components of CAP are briefly summarized and include--(1) an information center to communicate existing knowledge to youth in the area, (2) a survey of human resources, (3) a referral service, (4) vocational training, (5) job development, (6) on-the-job training, and (7) multi-county programs. Some policy suggestions are recommended. (PS)

This paper is part of a project conducted by the N.Y.U. Center for the Study of Unemployed Youth under a grant provided by the Office of Juvenile Delinquency and Youth Development, U.S. Department of Health, Education, and Welfare to develop curriculum materials for program planners and operators.

THE ROLE OF THE COMMUNITY ACTION PROGRAM IN THE SOLUTION OF RURAL YOUTH MANPOWER PROBLEMS

Youth is generally defined as that segment of the population between the ages of 15 and 24. This definition includes 24 million persons, or 13.4 per cent of the population. Of this number, 7.5 million are rural and 1.8 million of the rural segment are farm youth. In many ways the manpower problem of rural youth differs from that of urban youth, and it is to this point that this paper speaks. First, however, it is necessary to get an overview of the youth manpower problem.

BACKGROUND TO THE PROBLEM

In 1965, 550,000 teenagers entered the labor force. This was three times the average increase of the preceding four years and constituted 40 per cent of the labor force growth. In addition, the employment of youth age 20-24 increased by 400,000. As a result, the unemployment rate for teenagers dropped from 14.5 per cent to 13.1 per cent for males and from 15 per cent to 14.3 per cent for females. Nevertheless, teenage unemployment still remained the largest category of unemployment by far. In the 20-24 age group unemployment dropped from 8.1 per cent to 6.3 per cent for males and from 8.6 per cent to 7.3 per cent for females. This was still almost double the national average at that time.

The problem is further complicated by the fact that, during the next several years, the number reaching the age of 18 will be 3½ million annually or over 700,000 more than 1964, which was a very high year. The employment prospects worsen when it is noted that ¾ of the male teenage increase in employment in 1965 was in jobs as operatives or laborers which require little or no skill. Also, the biggest increase in jobs for males in the 20-24 group was as operatives. However, the 1966 Manpower Report of the President points out that occupations as laborers will decline in actual numbers by 200,000 between 1965 and 1975. While the operative category will increase in numbers, the total is relatively small and represents the smallest percentage increase of any of the occupations showing increases between 1965 and 1975. This means that most youth face the prospect of seeking employment in the occupations which will expand the most between now and 1975 or the professional, technical, white collar, and service categories. With the exception of some service categories, these are occupations which most often require more than the usual high school diploma. However, as late as

1963, there were more than 6.7 million out-of-school youth in the 16-21 age bracket and more than 45 per cent of them had less than four years of high school. Of those with less than high school, ¼ had no more than 8th grade educations and ⅔ had less than tenth grade.

Turning more specifically to the rural segment of the manpower problem, the effects of the technological revolution on the farm have been well documented. While the decline in numbers of farmers and farm laborers in the workforce will lessen between 1965 and 1975, there will still be a reduction of 800,000 in this category. Further, it is expected that only one in ten farm boys who come of working age in the 1960's will be able to own and operate a farm of sufficient size to make a living.

Thus, the technological revolution on the farm has doubtless served as the base for substantial poverty in rural areas. Based on OEO guide lines and the 1960 census, an internal document of the Department of Agriculture indicated that, of the 16 million persons thought to be in poverty, almost half of them were in rural areas. Of this number, at least 1.8 million youth in the 16-21 age group were included. Further, due to the age and education of the family head, the Department of Agriculture estimated that over one million families were "boxed in" with no place to go for relief. In addition, another 1.75 million rural non-farm families were considered to be "boxed-in" for the same reasons. Finally, there were 49,000 heads of farm families who were 25 years of age or less and 50 per cent of them had an 8th grade education or less.

Based on the above, it is not surprising that unemployment rates are consistently higher for farm people. This causes the farm person to turn to one of two alternatives. The first is to stay in the rural area and seek non-farm employment. From this standpoint, it is worth noting that while farm employment dropped 34 per cent during the 1950's, the rural population hardly declined. In addition, while there was a 23 per cent increase in non-agricultural employment in urban areas during the 1950's, there was a **19 per cent increase in non-agricultural employment in rural areas!** For many, particularly the rural youth, the first alternative has not been available or desirable. This leads to the second alternative and a major complicating factor in the manpower problem of rural youth — migration!

The large percentages of youth and the small percentages of ages 20-45 in rural areas compared to urban is evidence of a continuing pattern of migration. Nevertheless, there is strong evidence that rural youth make every effort to remain within commuting distance of their rural homes. For example, in a study made by Michigan State professors Beegle and Rice (for the National Committee for Children and Youth), it was clearly established

that while rural youth in the 15-19 age bracket are over-represented in comparison to those in urban areas in all geographical areas of the nation, males in this bracket are actually under-represented in areas which are 50 miles or less from a Standard Metropolitan Statistical Area. The reverse of this is true in communities which are 50-150 miles from such an area. This would seem to indicate that knowledge of job opportunities, better education and training opportunities, and the short distance from the home environment is correlated positively with migration. The opposite situation is true for rural youth in the 20-24 age bracket. Although generally under-represented in comparison with urban areas, they are significantly over-represented in areas 50 miles or less from a Standard Metropolitan Statistical Area. Yet from 50 to 200 miles away, they are substantially under-represented. This would appear to indicate that many of the youth in the latter areas had finished school and then decided to migrate upon reaching the age of 20. Conversely, the high percentages near the metropolitan area may indicate that more job opportunities are available, thus enabling the person in the 20-24 age bracket to farm and supplement his income or else turn to non-agricultural pursuits entirely while continuing to live in his home area. In both cases, it appears that most rural youth desire to remain in or near their home area for as long a period as possible.

That the alternatives suggested above are not always equally available was indicated in a study by Professor George S. Trolly of North Carolina State College[1] in which employment in outlying counties (defined as a county having no town of 50,000 population or touching such a county) grew only 1 per cent during the 1950's compared with 15 per cent for the national average. Further, around farm areas those industries that are attracted are usually large employers of women and/or contain a number of jobs for which the farm male has little training. Thus, it is not surprising that there is an annual heavy outmigration, particularly from the outlying counties, which has been totaling 250,000 in recent years.

Professor Bishop's study also indicated the effect of continued outmigration of farm youth on the rural youth manpower problem. For example, less than half of those on the farm in 1960 (in the age group 15-24) will still be there in 1970 in the North Central or the Northeast regions. In the West, only one in three would remain, and only one of five in the South. Thus, if the estimated farm migration of 2 million males during the 1960's becomes a reality, it would deplete the rural population by 8 million persons if not offset by an expansion in non-agricultural employment. This would approximate a 15 per cent decline in rural population. While, theoretically, one can draw

[1] (See Rural Youth in Crisis: Facts, Myths, and Social Change, U.S. Department of Health, Education, and Welfart, pp. 257-71.)

finite positive conclusions from such a prediction, the reality of history indicates a worsening of the manpower problem generally in a declining community and an upheaval of social and economic problems (with manpower being basic) in the form of increased slums, increased unemployment and heavy pressures for crash job-related education and training programs. Thus, the sword of alternatives has two sharp edges, both of which must be dulled if the rural youth manpower problem is to be solved.

THE COMPONENTS OF THE PROBLEM

Given the background just discussed, a number of general components of the problem can be summarized. They are:

1. Youth are entering the labor force at ever increasing numbers.

2. Youth generally continue to experience the greatest rates of unemployment.

3. There will continue to be both a real and percentage decline in jobs requiring little or no skill.

4. There is an urgent need for education and training beyond the usual high school degree.

5. Rural youth, in general, have a much lower level of education and training than urban youth.

6. There will be a continued decline of farm opportunities for rural youth.

7. The fact that very large numbers of rural families are "boxed in" has contributed to the disproportion of poverty in rural areas.

8. A geographical difference in migration patterns has developed largely based on knowledge of and/or actual existence of non-agricultural job opportunities.

9. A particular problem of employment opportunity exists (agricultural or non-agricultral) in outlying counties.

10. Rural out-migration has a real effect on the urban manpower problem.

The summary of the general components of the problem immediately bring to mind some needs and possible approaches to the solution of the general problem. It is here that specific components of the problem are discovered. Therefore, it is necessary to consider the totality of the problem be-

fore developing a framework for the solution. Thus, the specific components to be considered are:

1. In general, education and vocational training facilities in rural areas are far from adequate.

2. Despite heavy out-migration, there is still relatively little emphasis in rural vocational programs on non-agricultural related employment.

3. The existence of untrained labor has a negative effect on the community ability to attract non-agricultural industry.

4. Local rural communities, generally, are not capable of financing needed general and vocational education.

5. The spacial problem makes it difficult for rural youth to obtain knowledge of jobs in distant communities.

6. Services in general, are inadequate in rural communities, especially in guidance and counselling, and post high school programs are practically non-existant in most communities. Consequently, little is known of the interest, abilities, and aptitudes of rural youth.

7. Their background and environment have generally put rural youth at a disadvantage when seeking employment in an urban environment.

8. Even when needed programs exist, the geographical problem has hampered the identification of the specific and individual needs and potentials of all rural youth.

FEDERAL LEGISLATION RELATED TO THE PROBLEM

Before establishing a Community Action framework, it behooves a community to have, at least, a brief acquaintance with the existing legislation which might contribute to the solution of the problem. Space will permit only a cursory treatment of some of the major federal legislation and no discussion of state and local possibilities. However, this brief summary should put the Community Action Program framework in proper perspective. Some of the major legislation possibilities are:

1. **The Manpower Development and Training Act:** This Act and its amendments have been largely related to vocational training. It is now possible for youth as young as 17 to draw training allowances for up to two years. Also, the per cent of the total budget which can be allotted to training of

youth under 22 years of age has been increased to 25 per cent. In 1965, 42 per cent of the institutional trainees were youth under 22, and 39 per cent of the on-the-job trainees. In addition, experimental and demonstration projects are possible as well as a variety of mobility programs.

2. **Other Department of Labor Programs:** Either under MDTA or through its regular bureaus, the Department has a number of additional aids. For example, the Bureau of Employment Security has special youth programs which extend to most of their local offices. A prime example is the Job Opportunity Center. Other special youth job development programs have been created.

3. **Vocational Education Act - 1963:** Among other things, this Act attempts to de-emphasize agricultural and home economic vocational training and provide more of the skills whcih are needed for the jobs developing in the non-agricultural sector. Up to July 1, 1968, one third of a State's allocation, and 25 per cent thereafter, can be used for vocational education for persons who have completed or left high school and who are available for full time study in preparation for entering the labor market. High schools, vocational schools, and even colleges can qualify to administer such programs. In addition, grants are available for area vocational-technical school construction, and 125 were authorized in fiscal year 1965. Finally, work-study programs with cash benefits and experimental, developmental, and pilot programs designed to meet the special vocational needs of youth are available.

4. **Higher Education Facilities Act - 1963:** Education beyond the usual high school diploma is encouraged in the form of grants and loans for the construction of facilities. Twenty-two per cent of the total budget is allocated to public community colleges and technical institutes, and private technical institutes are eligible in the other 78 per cent.

5. **Elementary and Secondary Education Act - 1965:** The possibility of tackling the youth manpower problem in high school exists with this Act. Title I contains more than one billion dollars for grants to strengthen educational programs for disadvantaged children. Under Title II a wide variety of educational materials can be acquired. Finally, Title III allows grants for such services as guidance and counselling, including continuing adult education.

6. **Higher Education Act - 1965:** Under this Act funds are available for helping colleges and universities to provide community services, improve libraries and give financial assistance to students. Not only is work-study

provided for, but also grants of from $200 to $1,000 are available to high school graduates in financial need. Among the other provisions is the inclusion of a National Teacher Corps which could be of immense benefit in rural areas.

7. **The Appalachian Act:** While related to a specific area of the nation, the highway construction and reclamation programs have a direct relation to rural community development and may often be the major link in the chain of programs necessary for problem solution. Recently, the planning and location of vocational schools have been of prime concern to the agency.

8. **The Rural Community Development Service:** This service was recently developed in a Department of Agriculture and, according to one of its internal documents, has the primary mission of facilitating the administration of Federal programs in rural areas and guiding and helping USDA agencies plan and coordinate their rural community development activities. Public information programs, workshops, close coordination with the county Technical Action Panels are a few of the resources to be utlized in an effort to assure rural people of the availability of federal services. The Service has a very strong interest in vocational training of youth.

Finally, the RCDS proposes to develop Community Development Districts whereby municipal and county governments in rural areas can pool their resources for comprehensive planning and action. A typical district may contain two small municipalities, have a radius of fifty miles from the center and have as high as 240,000 in population.

9. **Economic Development Agency:** This is the successor to the Area Redevelopment Agency and has over 3 billion dollars for economic development programs. A major innovation is the introduction of multi-county districts and multi-state regional planning commissions. Starting July 1, 1966, special financial assistance will be given to economic deveopment "centers" contained in these districts.

10. **Economic Opportunity Act:** Popularly referred to as the Poverty Program, this Act contains such features as the Neighborhood Youth Corps, Job Corps, Vista, work-study, and migrant programs, in addition to the Community Action Program. The open-ended possibilities of community action should be kept in mind as Section 205 includes as possibilities programs and services such as "employment job training and counselling, health, vocational rehabilitation, housing, home management, welfare, and special remedial and other non-curricular educational assistance. . . ."

THE THEORETICAL BASIS OF A COMMUNITY ACTION PROGRAM

While the legislation is not explicit in the development of this framework, a number of theories must, of necessity, have been implied. Some of the more important ones which a year of administrative experience has made clear to the writer are:

1. Since the purpose of the Act is to reduce poverty, it is difficult to see how this can be accomplished without enhancing income. This implies programs which will make it possible for a person who is unemployed to become employed or for one who is in poverty as a result of underemployment to get a better job. Included, of course, is the removal of whatever obstacles exist which make it impossible for the intended trainee to embark upon the program. Consequently, all CAP programs should, in either the short or long-run, relate to the achievement of this stated objective.

2. Yet, there are a large number of agencies and an even greater number of programs which can relate to this objective.

3. Nevertheless, there are not nearly enough financial resources in the combined budgets to meet all the needs.

4. In addition, the programs that do exist are often completely uncoordinated and duplication of effort is commonplace. Thus, the already insufficient resources are further dissipated.

5. At the same time, it has long been argued that the local community is in the best position to analyze its own problems and to develop solutions — particularly if it is strengthened financially.

6. But even on the local level, there has generally been insufficient knowledge of all of the existing program possibilities, and often agencies which serve the same or similar groups have not known of the existence of the other. This is largely due to an almost complete absence of coordination of programs at the local level.

7. So the CAP program was established to inform, advise, introduce agencies, achieve cooperation, and attempt to coordinate the action of all other federal-state-local programs to the fullest extent possible. Theoretically, this makes sense, particularly in the case of the manpower problem of rural youth.

8. Thus, it was not intended that all community problems be solved with community action funds only or that a community action program was to consist only of components funded by OEO. Even theoretically, it was more

the intention that the local CAP serve as the catalyst to spur investigation, cooperation, program development and coordination rather than serve as an administrator with authority to direct all action. This kind of theoretical underpinning is fraught with awe-inspiring possibilities as well as frightful responsibilities.

RURAL YOUTH MANPOWER PROGRAM FRAMEWORK

The approach to the development of a manpower program should be no different from any other and there is no single model. It may be a separately operated component or part of an overall manpower component or total CAP program. The practicality of the situation should dictate the administrative arrangement, and the questions asked to determine the practicality would normally be the same. The order of the questions would generally be somewhat as follows:

1. What is the problem?

This may be quite obvious such as excessive youth unemployment, substantial high school drop-outs, lack of trained youth, etc.

2. What is necessary to solve the problem?

It is probably best to think of a chronology of needs rather than think in terms of specific program possibilities of specific agencies at this point. It may include such things as lack of finances, transportation problems, availability of vocational training facilities, etc. On the other hand, it may be the need to develop a public facility or attract an industrial plant or some other need indirectly related to solving the manpower problem of rural youth. In searching for what needs to be contained in a manpower program to solve the problem, it is well to assess all components from recruitment of the rural youth through training to job placement.

3. What contribution to solving the problem can the local community make?

This may mean a thorough assessment of local finances, the inauguration of an industrial development program, or simply a request to an existing service agency operating in the local community to expand its services throughout the geographical area.

4. What should be the geographical coverage of the program?

Assessments up to this point may provide a ready answer. Given limited financial resources and vocational facilities, many rural communities are finding it wise to develop multi-county programs. The pooling of resources in this manner may solve part of the problem.

5. What are are remaining gaps?

6. Which agencies and programs can relate to these gaps?

Here a knowledge of all program possibilities is important and a thorough perusal is called for.

7. How can a total unified approach best be achieved?

By this time, the number of agencies and programs involved should be known and the pieces put together. The program will be much more meaningful if this step is achieved and each agency to which a request for funds is to be made is fully aware of its role in the total integrated program. Piecemeal applications result in piecemeal programs.

SOME PROGRAM SUGGESTIONS

By this time, it is clear that there is a multitude of approaches which can be used as attempted solutions to the manpower problem of rural youth. These can be fully coordinated and integrated total manpower approaches covering a large geographical area or components of an overall program. The environment of the time will probably dictate what must be done. While it is best to look at such a program totally, it may be of benefit to discuss separate components and services, any or all of which can become a part of one total program. A brief summary of possibilities follows.

1. Information Center

A great deal can be accomplished by a CAP by merely finding ways to communicate existing knowledge to youth in the area covered. This could be as simple as one person in the CAP office to handle all areas of information, of which youth opportunities would be only one phase. On the other hand, there may be a separately operated youth program with an extensive amount of special materials and aids available for an inquiring youth.

2. A Survey of Human Resources

Even the existence of an information center will mean little if no one seeks the information. Yet, throughout the nation very little is known about individuals in need specifically. This is especially true in rural areas. In total, we know that so many youth live in an area, and perhaps the census data tells us that so many are in need. Yet we have few records of the individuals specifically and have no idea singly or totally of the actual needs and potentials of the youth in the area. What is needed is more than what is commonly called recruiting for a specific program. Rather, we need a door-to-door canvas if we are to fully analyze the manpower problems of rural youth.

This must be combined with interviews, tests, counseling, etc. One approach is to employ other youth to make the call and bring the youth to the CAP or other employment center. Often VISTA volunteers can be utilized. One approach which has been very effective in rural areas is the mobile youth center. In this case a bus or trailer is turned into a laboratory in which testing, counseling, etc., can take place. As the unit goes from one community to another, it becomes the youth center for the time it is there. Often these centers have programs which relate to the parents, as well as assembly programs in some of the schools, films, and even recreation programs. All these techniques can serve to heighten the interest of youth in the community.

3. Referral Services

The key to the two previous program areas is having a good referral system. The referral can be to a program run by the CAP or to one run by another agency. It can be to a job, to a school, to a manpower training course, to the county health department, etc. If there is good coordination among all the agencies and a thorough cataloguing of youth needs and potentials, the referral phase can be a most effective bridge.

4. Vocational Training

Hopefully, there will be the requisite facilities for institutional training at least in an area vocational school. If this is not the case, there exists enough flexibility in various laws to allow for transportation to and from the nearest city, or actual movement to the city with subsistence allowances. In fact, it is not inconceivable that experiments in housing near an area vocational school could be tried. A great variety of approaches to vocational training in rural areas is possible. Some of these are:

(a) **Farm Training:** While it normally would not be practical to attempt farm training for youth, it makes a great deal of sense to attempt to improve the lot of the adults previously discussed who are trapped on the farm. If they could spend the remaining years of their life in the environment they like best and with a more decent income, it would eliminate the necessity of their sons and daughters growing up in the city slum. Thus, given the proper youth manpower program in the community, a happier solution should be the result. One such program, recently developed, included literacy education, farm management, leadership development, cultural enlightment, progressive area improvements, community opportunities and resources and supervised on-the-farm training. A large number of services are to be performed without cost to the project by the State Agricultural Extension Service.

(b) **Agricultural-Related Training:** Although the number of farms are declining, the average size is greatly increasing. Consequently, a number of jobs are developing in the broader agricultural sense. For example, a very successful program which is currently being operated in Louisiana is training former farm hands to operate and repair complicated farm equipment. The sponsor, Loyola University, has developed small motivational groups for problem solving and has a basic education component which includes history, current events, civics, basic science, consumer eduation, home and family care, and health.

One of the most unusual agricultural-related training programs was developed earlier this year by the Employment Division of OEO. This is a ranch management program which will include all subjects necessary to make the trainee an efficient ranch hand in a 12-months-a-year job. Included is everything from branding to irrigation to artificial insemination and cattle diseases. Half of the time is spent in the classroom and half on the ranch. Basic education and cultural enrichment, as well as a formal recreation program are included for the youth, all of whom live on the ranch. Food is also provided, as well as clothing and a health allowance. Most of the trainees are rural youth, although some come from Denver and one from New York City. Their backgrounds range from experience as a summer cowboy to city boys with no work experience and who have never ridden a horse. Job offers already received at the ranch are several times the number of trainees and at wage levels double the rate for seasonal employees.

By the end of 1965, the MDTA program had trained 15,000 in agricultural-related courses. In addition, the Office of Education sponsored a study in 30 states to determine new and emerging occupations related to agricul-

ture for which training may be given. Some of the training to date has included dairymen, foremen, gardeners, nurserymen, and jobs in food processing and wood processing.

In addition, if agricultural-related public employment is considered, it is estimated that there are 265,000 man-years of non-recurring work and over 1,000 man-years of annually recurring work which needs to be done in national forests. Another 10,000 to 25,000 youth could be employed in constructing multiple-use roads, campsites, picnic areas, recreation facilities, planting trees, improving timber stands, as well as the range, wildlife, soil and water. Finally, the USDA estimates that non-urban recreation activities are to increase by 62 per cent between 1960-73; this will be an increase of 400,000 jobs.

(c) **Training Rural Non-Farm Residents:** While non-farm residents can be trained for any of the positions previously mentioned, there are great numbers of jobs which are developing in the rural fringe of urban areas. A very successful program currently operating in Tennessee utilizes a one-to-one ratio of volunteers to trainees who go into basic education programs in the rural area. After 8 to 24 weeks of basic, they are placed in OJT situations for 8 to 24 weeks. All of the job placements are in rural areas or in very small rural towns.

(d) **Training for Mobile Rural Youth:** While a great number of opportunities exist for the kind of training previously discussed, it must be recognized that many rural youth must look to the urban opportunity as their best choice. This is especially true when the high school diploma has been received and aptitude for non-rural opportunities exists. In this case the urban area and a number of rural counties should be tied together in one manpower program. Also, a good basic component is a multi-occupational vocational training program. This gives the rural youth a number of alternatives such as commuting to class, moving to the city for classes, receiving training which would not be possible in the rural area (but in some cases would enable him to return to or near his home environment) and relating these to a number of educational programs. For example, not nearly enough linkage of the many OEO educational-work programs has been attempted. Over the long run it should be possible to think in terms of a chronology of manpower services to youth starting with the Job Corps, to the Neighborhood Youth Corps, to Upward Bound, to the work-study provisions for college students. A central training program for a wide geographical area could be tied to this, thereby giving additional work-training-education alternatives for those unable to follow through to college.

5. Job Development

While job development components of manpower programs vary greatly in size, the rural areas need a thorough survey of jobs. Every employer in the area, particularly the small and medium-sized ones, should be canvassed. This approach often turns up unknown jobs or employers who are willing to do their own on-the-job training. It is possible to utilize this approach, however, for a formal and extensive OJT program. (OJT programs will be discussed under a different heading.)

The job development specialist should be thoroughly familiar with the businesses of the area and be able to ascertain training needs, as well as job opportunities. Thus, in close concert with the Employment Security Office, MDTA programs can be arranged. This component should be familiar with job opportunities in nearby or other areas, in order to properly advise the more mobile rural youth.

Consequently, aids to mobility can be very much a part of a job development program. A number of possibilities are available under MDTA, and there is no reason why there cannot be a variety of mobility aids developed by OEO funded programs. It would even be well to have a formalized aid program in the city for rural youth who migrate for training or a job.

6. On-the-Job Training

As already noted, an OJT program can be part of a number of manpower components, or it is possible to develop it as a separate component. OJT is simply the training of workers while on the job. Several Titles of the Economic Opportunity Act, as well as MDTA, make such training possible. It can be used in a variety of ways to assure a fully-developed job program. It is particularly useful for those youth who do not want to return to the kind of school they attended. The program is flexible in duration, as well as in the size of companies cooperating. It is also very important to combine OJT with remedial education. No one educational approach has proved best; so much experimentation on the local level is possible.

The development of OJT requires finding suitable training positions, negotiating a rate of pay with the employer, obtaining the consent of the union in many cases, and drawing up the training contract with the employer. While, in the past, the Bureau of Apprenticeship and Training has done most of this work, it is now possible for a CAP to serve as the "prime contractor" and deal directly with prospective OJT employers. The CAP sub-contracts with the employer subject to BAT review and approval.

One of the best examples of a comprehensive rural youth OJT program is the New Jersey Youth Development Program. Its primary purpose is to offer OJT in conjunction with remedial education, counseling, basic work experience and finally full-time employment. The youth worked with State agencies and received $1.25 to $1.35 per hour. Of the first 500 enrollees, 100 received full-time employment, others went into more formal OJT for service occupations, 30 went back to school, and a number entered the Job Corps, NYC, or the military.

7. Multi-County Programs

In the rural area, it is extremely important to think in terms of regions rather than small local areas. Any number of possibilities exist for CAP agencies to combine forces or for a separate regional organization to develop a manpower program which can not only contribute to problem solutions but can stimulate the development of a viable CAP program where one does not exist. The best example of this to date is in Mississippi, where the Catholic Church served as the catalyst for developing a non-profit state-wide agency. Eighteen centers cover the state as both human resources and jobs are catalogued. Basic education is taught at each center and all state agencies cooperate in referrals.

SOME POLICY SUGGESTIONS

It is extremely difficult in a limited period of time to make many specific policy recommendations. What is probably needed more is extensive use of the possibilities which already exist. Consequently, what follows are a few very general recommendations for both the local and the federal level.

1. There is a very definite need for the development of University Manpower Centers. Such centers can perform a variety of needed functions. For example, it can serve as a clearing house of information, provide valuable consulting services for program development and evaluation, and most important at the present is the training and orientation of regional and local CAP personnel. It is also possible to sub-contract difficult components to such centers and to cooperate with them in work-study programs. Fortunately, through the efforts of Dr. Sanford Kravitz, OEO has recently established four such centers, in addition to the one which is sponsoring this program today. Others will be developed by OEO, but it is always possible to work out cooperative programs with universities which have not received OEO grants for program development.

2. One of the most urgent needs on the local level is the training and orientation of your own personnel in the manpower field. The federal manpower staff in OEO is quite small and not available for such a program. Generally the regional offices do not have manpower specialists and in addition their staffs are small. While it is true that regional staffs allegedly received some orientation in manpower recently, it was not given from a background of knowledge in the field of manpower economics or with knowledge of the needs of rural areas. Consequently, the feeling of the writer is that any orientation received by regional staff worsened rather than improved the situation. Thus, it behooves a local staff even more to acquaint itself with the intricacies of manpower problems.

3. It is important for local staff to make its feelings, whether in regard to program administration or legislation, known all the way to Washington. The writer has received many comlpaints from rural areas that cities are given preference both in regional and federal offices. This complaint, along with sound program knowledge, received of necessity in university programs, should have a proper airing.

4. Thought should be given by local CAP's as to the proper administrative home for manpower programs. There is often duplication, and federal agencies are not equally qualified in manpower. For example, time and experience might suggest that the Department of Labor would be better qualified to handle OEO manpower programs. Much of the Act is already delegated. If there is a need to use OEO funds to stimulate old line manpower agencies, it might be possible for OMPER to serve this purpose as it has already done with experimental and demonstration programs. Your experience with manpower provisions of other Acts should be added to this thinking.

5. Clearly there is a need for liberalization of the provisions of much federal legislation. For example, OEO and OMPER can often give services which are not legal for Employment Security or some HEW agencies. Particularly in the case of Employment Security, the provision and encouragement for a broader range of services should become a reality.

6. There is a need for legislation provision for funding programs designed to study the total rural vocational training needs and potentials. This should be tied in with commercial and industrial development of rural areas.

7. There is need for specific authorization for broad human resources

and job surveys in rural areas. Only in this way will the nation be fully aware of its manpower needs and possibilities.

8. While a beginning has been made in some legislation, there still remains a need for setting aside specific percentages of federal manpower funds for rural areas only. This will serve to eliminate many of the administrative and rural biases which currently exist.

In the 1966 Manpower Report of the President, the concluding remarks in President Johnson's introduction to the report were:

> A manpower policy should lead us to a society in which every person has full opportunity to develop his—or her—earning powers, where no willing worker lacks a job, and where no useful talent lacks an opportunity.

The rural youth of America is composed of many willing workers and many useful talents. Thus, it is hoped that by highlighting their problems for the past few moments, a number of rural CAP's will be better able to help rural youth achieve the full opportunity of which the President spoke.

*NONPROFESSIONAL PERSONNEL; *YOUTH PROGRAMS; *EMPLOYMENT PROGRAMS; RECRUITMENT; PERSONNEL SELECTION; SUPERVISION; ON THE JOB TRAINING

The nonprofessional is described in this paper as a person who comes from the same milieu as that of the clients being served by the program. As such he can communicate with those clients not responsive to present professional training or techniques. He works as a part of a team with professionals, has an opportunity to contribute to policy making, has ancopportopity to contribute to policy making, has a career opportunity within the work he is doing, and is chosen without regard to academic or similar credentials. The roles of nonprofessionals can enhance the work of programs by freeing professionals to exercise their unique skills more fully. Some of the special characteristics of indigenous nonprofessionals which make them valuable staff members are described. Some ways in which nonprofessionals may be recruited, selected, trained, and supervised are suggested. A hierarchy of nonprofessional jobs is identified, each with a different level of responsibility and concomitant remuneration. (PS)

THE NONPROFESSIONAL WORKER IN YOUTH EMPLOYMENT PROGRAMS

INTRODUCTION

Youth employment problems are intensifying faster than we can solve them by traditional means. Walk into most youth employment agencies and note the harrassed look on the faces of many of the professionals as they scamper about with fistfuls of paper, two or more youth in tow, answering telephone calls which are demanding that more forms be filled out, and placating irate parents who want to know why the welfare department has cut off their checks just because their son is earning twenty dollars a week. Or notice the reception room with large groups of youth waiting to talk with someone, and waiting, and waiting. . . . Notice, too, the inability of some professionals to communicate with certain types of youth, and watch those youth as they leave the program embittered at, disenchanted with, and alienated from a world they don't understand and which doesn't understand them. It is our contention that nonprofessional workers, **properly trained and utilized,** can alleviate much of this chaos and waste.

The lack of acceptance of the nonprofessional is often based upon what he **cannot** do rather than on what he **can** do. Part of this stems from the title "nonprofessional" which is negative; it describes what the worker is not, rather than what he is. There is fear that disservice will be done to youth by foisting them off on well-meaning but professionally-untrained workers. One way of achieving some perspective on this issue is to look at the nonprofessional in terms of his role and the possible utilization of that role within professional disciplines. What can the nonprofessional do? And are such roles practicable within the context of preserving the professional's status and serving and protecting the youth?

In a recently completed training program[1] we found that there is a substantial role for nonprofessionals in youth employment programs; that given proper training and supervision the nonprofessional can perform, and is performing, some or all of the following duties:

> He gathers information relating to youth and their employment by visiting their homes and interviewing them and/or their parents. He acts as a reception and intake worker for new clients reporting to the agency. He assists counselors by administering structured interviews and questionnaires and discusses the findings with other staff members. He assists teachers or professional remediation workers

1 National Committee on Employment of Youth, "A Demonstration On-the-Job Training Program for Semi-Professional Personnel in Youth Employment Programs," **Final Report**, Dec. 1965.

tutoring individuals or small groups in reading and mathematics. He supervises groups of youth in the performance of certain maintenance, clerical or laboring tasks. He assists psychometrists in administering and evaluating a variety of tests or work samples. He canvasses employers by phone, mail or in person to locate possible job openings for youth and refers youth for interviews. He visits youth on the job or in training situations to discover progress and uncover problems. He recruits youth for the program by approaching them in the street or in areas where they congregate. He teaches specific skills in certain limited areas.[2]

These are real jobs within youth employment programs; they reflect the broad range of services which a program can adopt if patterns of personnel utilization are carefully delineated. More effective use also is made of the professional's specialized training and unique skills.

But it is not just a matter of having extra "hands" in the program or of being able to shunt off tedious or menial jobs on someone else which makes the nonprofessional valuable. He brings to a program certain attributes which, in and of themselves, make him a valuable addition to staff. In our discussion, we are referring to those youth employment programs dealing with deprived or minority-group youth, and providing outreach, counseling, remediation, work experience, vocational training, placement, or any combination of these services; and to nonprofessionals indigenous to the same neighborhood or group as the youth being served. The indigenous nonprofessional, therefore, has grown up in a milieu similar to that of the youth. Because of this, he has experienced most, if not all of the problems and frustrations inherent in that milieu. His family background, his patterns of speech, his hopes, dreams and desires, his experiences in coping with society's bureaucratic institutions, his knowledge of his neighborhood's social and anti-social alignments and biases; in effect, his "life-style" is the same in every way as that of youth growing up in distressed circumstances. And therein lies his strength. He can do what most professionals cannot do — he can **communicate,** in the broadest sense of the term, with those youth deemed "unreachable" or beyond hope by the professionals. Thus, the nonprofessional can operate as the "eyes and ears" of the program and as a "bridge" between the professional and the youth, interpreting for both what heretofore was unintelligible.

TRAINING

To augment his natural attributes, that is, to complete the bridge, the

2 **Ibid.,** These duties have been taken from a job description of "Professional Aide" (nonprofessional) developed by us and based upon actual work performed by sixty people during their training and after final placement.

nonprofessional needs to develop certain skills, to obtain certain information which will enable him to function within the program's structure and goals and to achieve a measure of self-esteem. His ability to relate to youth, despite his inherent qualities, will have to be learned, as will his relations to professionals and professional norms. And, conversely, the professional's ability to relate to him will have to be learned. This latter point is troubling administrators in the field as they often discover that there is serious lack of information on what constitutes proper tasks for **professional** personnel, to say nothing of nonprofessional tasks. Unless professionals clearly understand the objectives of a program and their roles and responsibilities within it, they will be unable to relate realistically to nonprofessionals. It is necessary, therefore, to prepare professionals for their own tasks prior to having them select, train or supervise nonprofessionals. Admittedly, this means changing old patterns of staff roles and utilization, and finding adequate time for the training. These are administrative functions or decisions which, if thoughtfully implemented, will enhance the effectiveness of a program by allowing for the differentiation of professional and nonprofessional tasks. And these tasks will determine in large measure the kinds of skills and information the nonprofessional will need, and how they will be transmitted to him.

Our experience gained in working with a variety of youth employment programs, indicates that nonprofessionals will need, among other things, some preparation in the following areas:[3]

1) **The social and psychological problems of youth.** Focusing and organizing the nonprofessional's experiences on problems related to: the family, the home, the peer group, the school, the neighborhood; problems of anti-social behavior: addiction, delinquency, probation and parole; specific problems of minority groups; poverty.

2) **Youth and the labor market.** Local labor market conditions affecting youth employment; employer standards for new workers; what youth needs to meet these standards; effect of good work habits; meaning of automation for youth.

3) **Perspectives, theory and operation of public and private social agencies.** Services and resources to draw upon; the role of the professional; the potential role of the nonprofessional; orientation to parent agency; special government-supported programs and services.

3 Ibid., pp. 22-42, for a more detailed description of these areas.

4) **Communication skills.** Techniques of observation, interviewing, reporting and evaluation; written and oral reports; dealing with professionals and youth.

In addition, they will need a practical application of these elements to synthesize the more theoretical aspects of their preparation. Experience has shown that in order for learning to take place there has to be active participation of the learner. In this respect, nonprofessionals are no different from anyone else when it comes to training. However, theoretical or vicarious learning can take place for nonprofessionals only after a certain amount of success has been achieved in practical learning. For this reason, on-the-job training is the key element in preparing nonprofessionals to work with youth. It is the means by which relatively abstract knowledge is translated into practical terms; it is a time for trying out unused skills and developing new skills in a protected setting. A real learning experience is, of course, essential; one can not be successful and use tasks of a make-work nature. Nonprofessionals, as all workers in the field, need to have direct contact with the youth being served. And they need to perform a variety of tasks in order to test themselves in different situations. Again, as with anyone in a new situation, the nonprofessional learns best by starting with relatively simple tasks and proceeding to the more complex.

The broad subject areas listed earlier are more easily understood and assimilated by the nonprofessional when related to experiences gained on the job. The nonprofessional, himself, can recommend specific facts and material he needs in order to do his job properly. Thus, whether training be formal or informal, an atmosphere which is at once **flexible** and **demanding** should be fostered. **Flexible** because each nonprofessional worker will need different things at different times with varying degrees of intensity; each will have had different experiences on the job, leaving much leeway in training to the awareness of the supervisor. **Demanding** because the nonprofessional worker needs to understand his responsibilities to youth and to the program, and that his greatest asset—that upon which his employment is based—lies within the **disciplined** application of his own resources.

SUPERVISION

The role of the nonprofessional's supervisor (or trainer) is difficult, then, because he too must be both flexible and demanding, because he must allow the nonprofessional to achieve a degree of independence within the limits of nonprofessional responsibilities.

The nonprofessional worker, at least when first hired, needs a highly structured situation in which he can perform his tasks effectively. While he can be extremely resourceful within his given areas of functioning, his previous work experience, largely in unskilled occupations, limits his ability to

work successfully without direction. Few, if any, nonprofessionals will have had "white collar" jobs, and they will tend to associate the role of a supervisor with that of a foreman in a production situation. Instead of the give-and-take of a supervisor-nonprofessional relationship, the worker will expect to be told what to do and how to do it. The sophistication, discipline and self-confidence required to work in an unstructured atmosphere will have to be learned, and the supervisor must establish the kind of relationship with the nonprofessional which will result in achieving that learning. Whether the nonprofessional acts independently or as a member of a team, his proper utilization is based on the role prescribed by the program and the supervision provided by the professional staff. While these are broad guidelines of supervision applicable to all workers, for the nonprofessional, supervision becomes the make-or-break element because his job description will be different from any previous worker's description and, therefore, supervisory techniques will have to be somewhat different from those used with professionals or graduate students.

The nonprofessional should have **one** person to whom he can turn for direction and guidance and a base to which he can return for support and instruction. This does not preclude his working with a number of professionals, but it does imply that one person will be responsible for the way in which his work is assigned and carried out and for the way in which other professionals deal with him. If his place in regular agency or program operation is not clear to him and to other personnel there is the danger that his job will deteriorate into unrelated and meaningless assignments. In the case of a new program where all staff are learning their jobs, supervision of nonprofessionals becomes difficult, but could be incorporated as part of the training of professional staff.

The nonprofessional should be encouraged to discuss methods and techniques for dealing with his own job within the agency as well as with the target population. Again, through an adequate understanding of his own role, he can function better with those in need of service.

Our experiment in the use of nonprofessional workers indicates that supervisory time, as with all workers, must be extensive in the beginning, but as the worker becomes more familiar with his role, time can be reduced in most instances. We found that where a thoughtful supervisory program has been established, the nonprofessional has been much freer to admit his inability to cope with various problems and to seek the necessary help than in those cases where supervision is provided haphazardly. The regularity of supervisory conferences depends upon each program, but for the nonprofessional these conferences should be held no less frequently than conferences with other staff.

SPECIAL CHARACTERISTICS

It is easy to overlook or forget that what the nonprofessional brings to a program is a background of poverty, minority-group membership and discrimination. The prior work experience of those nonprofessionals we trained was generally as unskilled factory hands, porters, maintenance men, delivery boys or other dead-end positions. Female nonprofessionals generally had been employed as domestics, laundry workers, and the like. Placed in a situation where suddenly they had new status and different roles, it was extremely difficult for them to retain balance. One of the more difficult tasks for those programs in which we placed people was how to ensure that the nonprofessionals maintained their identity and contact with the target population and, at the same time ,understood, but did not overidentify with, the middle-class orientation of most professionals. In a few instances, nonprofessionals tended to overidentify with the clients. This, too, poses a difficult problem.

While many facets of this problem can be coped with in supervision and training, a few can be precluded by a careful recruitment and selection process. By careful we don't mean "creaming," but rather an emphasis on the human element, that is, selecting nonprofessionals on the basis of their ability to relate to many different kinds of people and on an ability and willingness to innovate in a field not known for its dogmatic methodology. The ability to innovate is important when dealing with disadvantaged youth. Often programs will not have the best facilities or materials for dealing with particular problems. For example, we experienced the case where, after only a half-day training session on remedial techniques, a nonprofessional trainee began teaching a youth to read better in a room devoid of newspapers, magazines, books, and blackboard. With only a pencil and paper she was able to make astonishing progress with the youth. After talking with the young man for some time, she found out that his major interest was in playing basketball. She tore what little paper she had into many small squares and printed on each one a single word the youth had used when talking about basketball. She had him look at all the words and then pick out groups of words to make simple sentences which he could understand. As the youth became surer of himself, the worker gradually added more words to the pile—words the youth had used. He became so fascinated with the "game" of learning to read that the worker had to insist they stop after two hours—she was exhausted. Despite lack of materials, she utilized what she had learned in a way which many people could not. And it is this ability to innovate which is so important in selecting nonprofessionals.

RECRUITMENT

Just stating that nonprofessionals will be used does not answer the questions of where they will come from nor how the desired characteristics can be identified. The recruitment of nonprofessionals will be different from the recruitment process for other workers. A number of sources can be tapped for locating potential nonprofessionals, some better than others, depending upon local conditions and the program's influence in the communtiy. For one program, the public employment service might be best, for another, street-club workers or church groups. But whatever the major sources, potential nonprofessionals will have to be sought after. It is unlikely that they will voluntarily approach an agency or program and ask for a job. Restrictions as to education, training and experience have eliminated from their thinking the possibility that the social service fields might be open to them. And up to very recently they were right. So they must be "found."

In our experience the following resources were helpful:

1) **The State Employment Service,** particularly those local offices which are located in disadvantaged areas of the city or community, or in those areas being served by the program. Local offices which specialize in referring applicants for training or retraining under the Manpower, Development and Training Act are also extremely useful. Applicants who are referred there for training or who apply on their own have one basic advantage over other people; they have recognized (or have been made to recognize) that they need to explore other fields of work. Employment service interviewers at local offices can perform preliminary screening for the program and can provide program staff with another view of the applicant. It is important to elicit each employment interviewer's personal evaluation of the applicant to determine if they understand the goals of the program and the criteria for selection.

2) **Public and private social agencies,** especially those serving populations similar to the program's youth population. They will have contact with local people who may have worked for the agency either on a paid or voluntary basis. This kind of referral is useful for two reasons. First, it provides the program with an excellent preliminary screening device which can save considerable time in the selection process and, secondly, it involves other agencies with the youth employment program. This involvement makes for allies who can be called on for help in other situations. They are, in effect, committed to the program and are excellent sources for supportive services.

3) **Neighbors and acquaintances of present nonprofessional workers** are good employment risks. In any field, employees who believe in their jobs will usually be extremely careful about whom they will refer to their employer as potential co-workers. Then, too, in the course of living and

working in the community, they are likely to meet people capable of working well with youth, and they often can identify intuitively those people who are desired by the program. They can spot the "phonies" who give the right answers to questions but who, for their own needs, tend to exploit people.

There are numerous other sources for recruiting non-professionals such as advertising, local schools and their associations, housing organizations, and religious institutions. However, agencies and individuals referring applicants must understand the goals of the program, its plan of operation and its basic criteria for hiring. A poor referral is a waste of staff time and a disappointment for the applicant. As more and more contact is achieved with referral sources, staff will have to deal with changing concepts of the program. This is an ongoing process which, if handled properly, will cement relations with those sources and, conversely, if the process is ignored, the program can expect confusion, misinterpretation of goals and referral of unqualified applicants.

Selection

Many different kinds of people can be utilized in youth employment programs, and each can contribute valuably no matter what his or her experience and achievement has been in the past. However, not everyone from a minority group or from a poverty neighborhood is suitable for, or will be willing to do this kind of work. The purpose of an intensive recruitment process is to ensure that those who are suitable and willing have an opportunity to apply.

People indigenous to a disadvantaged neighborhood or group, as described earlier, have certain inherent characteristics which make them useful in working with youth. In addition to these characteristics the selection process should be concerned with identifying those who want to be part of society even if, at present, it is the worst part; who stand out as a father, mother or family member; who indicate a benevolence toward youth; who evidence attachment rather than disattachment toward people; who have potential leadership qualities and a reasonable measure of social maturity. The greatest intellect is not called for; attitude, maturity and motivation are the important characteristics to be sought.[4]

Education, in particular, has been, and continues to be, the major barrier for nonprofessionals seeking work in a human relations field as it is in much of private industry. For many professionals, nonprofessional means someone with a bachelor's degree in one of the social sciences, some related work experience and a stated desire to go on for an advanced degree. Happily, there are enough professionals and agencies willing to accept far less in the way of formal education. We found that level of education need

4 We are indebted for this formulation to Dr. Richard Brotman, Division of Community Mental Health, Department of Psychiatry, New York Medical College.

not be used as a criterion for selection when consideration is given to those characteristics cited above. Correlation between formal education and job performance is inconclusive. Most nonprofessionals with comparatively high levels of education are doing well on the job. Most of those with less formal education, however, also are doing well on the job. This seems to indicate that while education may be helpful, there are other, more pertinent, factors which lead to satisfactory job performance. We found that an alternate correlation seems to be a great deal more applicable. That is, when a nonprofessional was hired by an agency and performed well on the job, he was then likely to seek formal education as a means for upgrading in the field.

Some programs using nonprofessionals have found that, at times, education plays a negative role in the performance of a job. It may actually hinder certain kinds of relationships with youth by creating an inflated sense of self-importance or pseudo-professionalism in the nonprofessional.

Assuming then that educational requirements are left flexible, how can youth employment programs identify the amorphous characteristics so important to the job performance of the nonprofessional? In our experience, tests proved to be almost totally useless when applied to the kind of population we were considering. Only gross deficiencies showed up and these were more easily identified in a personal interview. We used a reading, writing and comprehension test which was useful in determining literacy levels of each applicant. However, if the applicant grasped major concepts and could express them (orally or in writing), whether grammatically correct or not, then he was considered a good risk for the program. His true verbal skills could not be assessed by the tests.

We used a lengthy personal interview with many open-end questions that allowed the applicant to express himself on a variety of topics and that gave important clues to his attitude, motivation and maturity. Standard information dealing with the applicant's education, work history, health, etc., was also gathered at this time. Each applicant's answers were later summed up by the interviewer on a separate form and presented in a case conference with all staff. The interviewer answered questions posed by staff about the applicant's characteristics and background. A decision to accept or reject an applicant was made by all staff. In some instances a second interview was conducted by a different staff member to clear up certain unsettled questions.

There are any number of other ways the selection might be made, but above all, the interviewer must be aware of the nature of the cultural background of the applicant. He must listen to what the applicant is saying and determine whether the words being used by both are understood in the

same way by both. The street talk, poor grammar or accent of the applicant may conceal a worker really needed by the program — one who can talk and listen to youth and their families.

Upgrading

Achievement of professional status depends upon extensive formal education; there are limited possibilities for reaching the professional level without advanced degrees. As professions achieve certified status, new people coming into the fields are required to have more and more graduate training. There are few, if any, alternate routes to professional status. This means that a permanent gap exists between the professional and nonprofessional, the only bridge across that gap being formal education. And there is little being done to provide upgrading within the nonprofessional's role. Too often "nonprofessional" is seen as a single category of worker, with no gradations and no chance for advancement. Some nonprofessionals may be satisfied to remain at the entry level, with only periodic salary increases as they gain experience and seniority. But others will need the opportunity to expand their knowledge and increase their skills so that they may assume greater responsibility and earn more. If nonprofessionals are given appropriate supervision, direction and opportunity for additional training, youth employment programs will find they can develop highly skilled workers. For these people, a hierarchy of nonprofessional jobs could be developed, each with a different level of responsibility and concomitant remuneration. For example, a program might consider some or all of the following categories:[5]

1) NONPROFESSIONAL — new worker, no minimum educational requirements, needs constant training, orientation and supervision, may do some elementary information gathering in the field or act as escort for youth, can be promoted to subprofessional level.

2) SUBPROFESSIONAL — needs continued training and supervision, may do reception and intake work, preliminary screening of youth, make telephone contacts, and other such tasks, can be promoted to semi-professional level.

3) SEMI-PROFESSIONAL — needs training and supervision but on a less intensive basis, may do extensive field work, data collection in the community, make family contacts, direct the performance of a work crew, may assist in the supervision of lower levels, can be promoted to assistant or aide if obtains required academic or experiential credit.

5 This hierarchy of jobs is based in part on Pearl and Riessman's model for new careers in education in which they propose: Supervisor, Teacher, Associate, Assistant and Aide. See Arthur Pearl and Frank Riessman, **New Careers for the Poor: The Nonprofessional in Human Service,** The Free Press, New York, October 1965, pp. 55-74.

4) ASSISTANT/AIDE — has two years of college or equivalent experience working with youth, may do preliminary counseling, may administer structured questionnaires, may assist remediation instructor, may make employer contacts, may assist researchers in data gathering or interviewing, helps supervise all lower categories, can be promoted to associate if obtains required academic credit.

5) ASSOCIATE — has bachelor's degree with major in one of the social sciences, assists professional in all major functions, helps supervise all lower categories, may perform all or part of the administrative and reporting functions for the professional, performs those tasks which cannot be handled at lower levels but which are still below the professional level, can achieve professional status by obtaining required graduate credits.

6) PROFESSIONAL — has a graduate degree and/or certification in one of the social sciences, responsible for overall training of others, responsible for supervising the work of all others, delegates work to the appropriate personnel, deals personally with the more serious problems of youth which require his special skills.

With such a structure a youth employment program could hire staff at all levels, but more important, it could provide the opportunity for nonprofessionals to advance to whatever level they were capable of achieving. There would be a clear-cut system of rewards for work well done, a system which could be understood easily by the nonprofessional. And it would increase the effectiveness of the professional; he would be free to spend more time on his truly professional duties: supervision, training, and handling the serious problems.

However, whether such a structure is used or not, those nonprofessionals indicating a desire and aptitude for moving into professional ranks should be allowed to exercise their option to do so. Programs which hire nonprofessionals should consider the possibility of providing scholarships, fellowships or stipends to enable qualified personnel to upgrade their educational levels. Agreements with colleges and universities might be developed allowing for advanced placement on the basis of experience gained on the job. Information on, and aid in, preparing for Proficiency Examinations could be made available by the program. Or, an agency might induce local colleges, particularly community colleges, to develop new curricula and different screening and selection criteria. Those nonprofessionals not possessing high school diplomas could be encouraged and coached to take equivalency examinations.

For a few people such procedures would enable them to reach a professional level and would be one more way for dealing with the shortage of professional workers. Most nonprofessionals who opt for further formal

education will not reach the professional level, but whatever level they reach, the opportunity for self-improvement will affect all aspects of their lives. It will mean movement within the program and within the field. As they advance on the job or move out to other agencies or fields, there will be continuing opportunities for others to enter and advance. There will be created, in effect, a large group of people able to work in human services at all levels of need.

Conclusion

Community acceptance of the relatively new social service professions has been too slow for too long. This, more than any other factor, has led to adverse criticism of the use of nonprofessionals. Fears are expressed that if tasks once performed by professionals are turned over to nonprofessionals there will be an accompanying loss of status for the professionals as well as a "watering-down" of services to youth. There is, of course, the obvious defense that the increasing shortage of professional workers in the face of demand for increased services has created the need for new kinds of workers. However, let us consider the problem from two other standpoints, namely: (1) What is a nonprofessional? and (2) What is a professional?

1) The nonprofessional has been described in this paper as a person who comes from the same milieu as that of the clients being served by the program. As such he can communicate with those clients not responsive to present professional training or techniques. He differs from production and service workers who are not professionals because he works as part of a team with professionals, he has an opportunity to contribute to policy, he has a career opportunity within the work he is doing, and he is chosen without regard to academic or similar credentials. His very name signifies his function and his limits: he is an aide, an assistant, a **non**professional — he is **not** a professional. He should **not** be used in lieu of a professional when the job to be done clearly calls for someone trained in a specific discipline. He is **not** out to take over the professional's role, but rather to enhance that role and make the professional more valuable to youth, to the program, and ultimately to society.

2) Sociological definitions of what constitutes a profession and a professional vary in many ways, but each incorporates some or all of the following factors: prolonged training, autonomy, expertise, an ethical code, community sanction, a service ideal, and responsibility in the use of the special competence. The sum of these factors indicates that the specialized training and unique skills of the professional must be aimed at the best possible service to his client. There is a clear mandate that he use whatever competence and resources he can muster to provide that service. There is a further responsibility inherent in the meaning of professional. Because

of his store of knowledge and technical skills, his efforts should be devoted to exploring and extending the boundaries of his field while others perform those routine duties for which he has prepared them. In other words, it is incumbent upon the professional to pass on, to teach, to train others in those tasks and techniques which no longer require the same degree of expertise which once they did.

Summary

We have shown that there are roles for nonprofessionals in youth employment programs. We have taken the position that these roles can enhance the work of programs by freeing professionals to exercise their unique skills more fully. In addition, we have noted some of the special characteristics of indigenous nonprofessionals which make them valuable staff members. We have suggested some ways in which nonprofessionals may be recruited, selected, trained and supervised, and have indicated some of the problems to be considered. The foregoing are in no way complete or all-inclusive and are intended only as a guide or stimulant for further investigation. Each youth employment program, perhaps using some of the concepts and categories noted in this paper, will have to develop its own approach to the question of using nonprofessional staff.

YOUTH OPPORTUNITY CENTERS; YOC

The Youth Opportunity Centers (YOC) are operated by State Employment Services with funds and guidance provided by the U.S. Department of Labor's Bureau of Employment Security. Present plans call for more than 175 YOC's in 140 cities throughout the Nation and serving 1,000,000 youth, 16 to 21, with outreach, conseling, testing, job development, placement, followup, and referrals to training and remedial services. The YOC emphasizes employability. The Centers are located in offices separate from those of the regular Employment Services in fringe areas between the pockets of poverty that make up the slums, and the business area of the city. Nearly 421,000 new applicants were served by the Centers from the time the first YOC opened in February, 1965, until the end of 1965. More than 100,000 youth job placements were made during the first year of operation. Farm placement accounted for 3 per cent, unskilled occupations 31.1 per cent, clerical and sales positions 30.7 per cent, and service trades 20.3 per cent of the 100,000 placements. The importance of coordination with the Community Action Program, MDTA program, Job Corps, Neighborhood Youth Corps, and other remedial programs is emphasized. Some problems of the YOC are discussed. This paper is part of a project conducted by the N.Y.U. Center for the Study of Unemployed Youth under a grant provided by the Office of Juvenile Delinquency and Youth Development, U.S. Department of Health, Education, and Welfare to develop curriculum materials for program planners and operators.

THE YOUTH OPPORTUNITY CENTERS OF THE PUBLIC EMPLOYMENT SERVICE

For the first time in the 19 years of his existence, Joe Beecher realized he was trapped. Not only had he missed an easy shot to the side pocket of the pool table, but a search of his blazer jacket yielded only a nickel, two pennies and one bent cigarette. It was only 10 p. m. and he didn't have enough cash for another game. And this guy who had just beaten him at pool was offering him a light and some advice.

"So why don't you come over and see if we can help you get some money?" He sounded like he came from the neighborhood. Joe had seen him around.

Joe looked closely at the guy — he was maybe two or three years older than Joe. "Money?" Joe asked. "How much?"

"That depends. Maybe 50 bucks a week — to start." This guy, Joe recalled now, had said he was Bill Smith, a Community Worker employed by the YOC. Joe wasn't sure what "YOC" meant, but Bill Smith was offering Joe a way to spring open all those tight traps.

Joe's mind raced quickly over some of the traps. Born in a dingy three-room apartment facing the alley on this dirty street, Joe had been raised by his mother. He didn't remember his father. For his two younger brothers and a sister, as well as his mother and himself, the monthly welfare check was the main source of support. Toward the end of the month, when the last can of pork and beans was gone, Joe's mother would tell Joe to take care of the children while she went out to wash floors for $8 a day and carfare.

Most of Joe's youth had been spent on street corners, in pool halls, dodging the cops. He picked up a buck now and then, running errands for the big operators on the block. For most of his school years, he was a fugitive from the truant officer, who eventually gave up and forgot him. He wrote "Joe Beecher" occasionally and painfully, but little else. He could read numbers and some simple ads, but he floundered in a long sentence. In fact, the draft rejected him because he couldn't answer the 8th grade arithmetic and reading questions on the Armed Forces Qualifying Test.

The morning after their meeting at the pool hall, Joe Beecher kept his date with Bill Smith at the Youth Opportunity Center. Joe had never been in a State Employment Security office before, but he'd heard unpleasant stories from guys who had. He was surprised when he got inside the YOC. It wasn't what he expected.

He found the big room in front pleasant and well lighted. The walls were done in soft pastels. There were comfortable, upholstered chairs spaced in circles around low tables. Joe sat down in one of them. He noticed the tables had ash trays as well as papers and magazines, scattered over them. Joe's eyes roamed over the right side of the room, where he saw a row of booths, with swinging barroom-type doors, painted in bright red, blue, yellow, green and orange colors. In the back of the room, Joe could see several desks at which people sat, some writing, some telephoning, some talking to kids his age. Joe began to feel at home when he noticed the juke box along the wall next to the reception area. The juke was playing some solid rock, although it was tuned a little too low for his taste.

Bill Smith greeted Joe and ushered him through one of the swinging doors where he was introduced to John Fowler, a YOC counselor. Bill Smith stayed for a while, but Joe scarcely noticed when Bill slipped out. Joe was talking about himself to the young counselor. He felt that what he said and what he wanted were important to John Fowler.

Joe came back to the YOC often for more interviews. Once John asked him to take a test. Joe didn't mind the test too much for it had many things he could do, even a part with pictures and numbers he had to match up. Very little reading.

Within two weeks of his first visit to the YOC, Joe was offered a job with the Neighborhood Youth Corps. He was a member of a work crew assigned to cleaning up the city's parks. It wasn't the 50 bucks a week he had hoped for, nor was the work exactly pleasant. But John Fowler told him it would be only temporary, to give him some work experience. At least he now had money to spend — for a haircut, for some new shirts and pants, for food, for cigarettes and to take home. "Man, I'm getting with it," he told Bill Smith one day, "I'm swinging."

Then came his chance. Maybe because he'd had so many hungry days in his short life, Joe had always dreamed of becoming a cook. John Fowler told him about on-the-job training where he could learn new skills and earn money while he was learning. He told Joe about an OJT opening as a cook trainee. It paid $1.50 an hour to start. After six months of OJT Joe would be making $2.50 an hour — 100 bucks a week. He grabbed the referral slip and rushed out to see his new employer. Joe was hired.

Both Bill Smith and John Fowler have eaten at the restaurant where Joe is working. Joe's boss is pleased at his dependability and native intelligence. In the fall Joe plans to enter night school to get his high school diploma. He would like to run a Hamburger Haven of his own some day. Thanks to the

YOC, Joe Beecher escaped the tight traps of the past for the open vistas of the future.

* * *

The YOC that Joe Beecher visited was one of 132 that were operating by May 1, 1966, throughout 50 States, Puerto Rico and Washington, D. C. With funds and guidance provided by the U. S. Department of Labor's Bureau of Employment Security, the affiliated State Employment Services have moved rapidly to open these new community manpower service centers dedicated to youth, 16 to 21, since the first YOC opened quietly in Albuquerque, N. M., on February 4, 1965. Albuquerque was officially dedicated months later, but Memphis, Tenn., had the distinction of the first public ceremony for its YOC on February 15, 1965.

Present plans call for more than 175 YOC's in 140 cities throughout the Nation and serving 1,000,000 youth with outreach, counseling, testing, job development, placement, followup, referrals to training and remedial services, and helping to reduce further the critical 10 percent unemployment rate for those 16 to 22, still four times as high as that for adults over 22. With the establishment of youth personnel and youth units in regular employment service offices and mobile teams throughout non-urban America, improved employability services are being extended to additional thousands of youth.

The Youth Opportunity Centers are separate, identifiable facilities that provide young persons with one clearly designated place to go for highly personalized services tailored to meet their individual needs. The Centers are located in fringe areas, between the pockets of poverty that make up the slums, and the business area of the city. They are near main transportation routes, making them accessible to all youth, not just the disadvantaged.

Youth may visit the YOC on their own initiative or they may be referred by others — schools, health and welfare agencies, juvenile courts, religious organizations, private, civic and social organizations; or friends or families of youth may refer them to the YOC. Youth who visit the regular local office of the State Employment Service and who are in need of specialized youth services are referred to the YOC in their vicinity.

The Youth Opportunity Center emphasizes employability. It focuses upon the whole youth, with the aim of providing the services needed to help him overcome deficiencies in education, training, motivation, or other areas that affect his employability. In order to do this, the YOC program utilizes all the resources of the community, including health services, educational, social welfare, and recreational services; or governmental or private industrial facilities.

YOC FULL-SCALE SERVICES

Youth who visit the YOC are provided with the following:

1. Exploratory interview
2. Couseling, both individual and group
3. Testing, to determine aptitude and achievement level
4. Occupational information
5. Referral to training facilities
6. Referral to community facilities for diagnostic and remedial services
7. Referral to and placement in part-time, stop-gap and regular jobs
8. Followup to assure satisfactory adjustment to a referral facility.

The case of Joe Beecher is not atypical of the 421,000 new applicants served by the national network of Youth Opportunity Centers from the time the first YOC opened in February, 1965 until the end of 1965. Fifty-five percent of these applicants have been males; 43 percent were 18 or 19 years old. Only one-fourth of the applicants had jobs when they came to the YOC, but a number of these were underemployed. More than half of the applicants had not finished high school and 60 percent of those who were dropouts had been out of school for more than a year. The majority of the YOC clientele were single, but more than 12 percent were already married and one or more dependents were being supported by 11 percent. Better than 7 percent had at least one child dependent, while 2 percent had dependents other than children.

A close look at nearly 4000 applicants served in a short period by the Minneapolis YOC confirms the widespread prevalence of Joe's problems. More than half of the youth cited low family income as one of their principal worries. One fifth were members of families receiving public welfare aid. One fourth were plagued by the disrupted marital status of their parents. Nearly one-fourth had physical or mental handicaps. More than one-fifth had been involved with the authorities — and 11 of the 132 young women in the group were unwed mothers.

Many of the YOC's have pioneered new services to youth — particularly the disadvantaged. For them, 1965 was a year of innovation and accomplishment — a chance to do many things for youth they never had the resources to do before.

Based on personal visits to more than 30 YOC's, a careful analysis of the monthly statistical reports and the periodic staff evaluations of YOC's; this paper is an attempt to capture both the spirit and the reality, the successes and the failures, the performance and the promise of the first year of an emerging national institution — the Youth Opportunity Centers.

PHYSICAL FACILITIES

Location of the Centers in offices separate from those of the regular Employment Service enables their managers and staffs to start afresh in designing and arranging attractive facilities for their youth clients. Informal reception areas are designed to put the young applicants at ease. In some centers, reception rooms are furnished with movie projectors that show slides and films. The decor includes pictures and attractive posters. An ever-changing array of clippings, pamphlets and notices lines the bulletin boards. In some cases flower boxes partition the rooms.

In Phoenix, Arizona, a counselor who is also a skilled cartoonist illustrates "employment pointers" on a sketchboard in the waiting area. In Jamaica, New York, the YOC has a display board in the entrance area captioned "Youth in Art" which is reserved for the tempera, charcoal and pen and ink drawings of YOC clientele.

In Miami, Florida, a record player pipes music into the reception area while the Milwaukee, Wisconsin, YOC has been experimenting with commercially furnished music broadcast throughout the Center.

Although the national office is working on plans for a juke box that dispenses occupational information as well as music and a TV-like apparatus that shows 20 minutes or more of 8 mm film without interruption, many YOC's have gone ahead with imaginative use of available visual aids. Occupational films available from the Department of Labor have been supplemented with other educational films obtained from business and state departments of travel, conservation and education. These not only raise the horizons of applicants, but make group sessions more interesting.

OUTREACH

Obviously, the YOC's cannot find jobs or training for youth if they cannot find the youth. Thousands of the most disadvantaged of our young people are submerged in urban ghettos or up the back roads of barren hills in rural areas. Coming from families with several generations of welfare recipients or with catch-as-catch-can employment records, many have never seen the inside of an Employment Service office. To seek out and find these youth,

all YOC's were urged to establish outreach programs. A total of 32,000 youth were brought into YOC's through outreach in 1965.

A door-to-door recruitment program initiated in Hartford, Connecticut, in January 1966 met with some success. The home visit technique was also tried in Mt. Vernon, New York, utilizing lists of dropouts furnished by the public schools and in Casper, Wyoming, through the use of the Salvation Army's Christmas Basket list.

In both Honolulu, Hawaii, and San Antonio, Texas, youth have been sought out in their own neighborhoods. Many have later reported to the Centers for counseling and placement. In Honolulu, the YOC has used its corps of Community Workers for outreach; San Antonio uses 42 NYC enrollees of the SANYO program and in Rochester, New York, a small van has been outfitted as a mobile office or "recruitmobile" where youth can be interviewed with privacy in the disadvantaged neighborhood. YOC staff members in Providence, Rhode Island, are carrying their message directly into all homes by daily appearances on a local television program.

Several Centers have been contacting young people who are soon to be released from correctional institutions. In December, 1965, Lynn, Massachusetts, reported the successful placement of seven parolees who had been counseled and tested in that Center's "Within the Walls" project. Of those youth contacted in the Maryland Training School by the Baltimore YOC, 97 percent have come to the Center for assistance immediately upon their release.

It is expected that as YOC's gain more experience they will invest increased amounts of imagination and effort in their outreach programs. Only 8 percent of all applicants served thus far by the Centers have come into the YOC's as a result of outreach. A majority (60 percent) have come in on their own initiative; while 16 percent have been referred by schools and social agencies.

COUNSELING

The program of YOC services often begins with counseling, particularly for the disadvantaged. Throughout the Employment Service, while initial counseling interviews given adults declined slightly in 1965, the rate for youth increased by 11 percent over 1964. In the newly-opened YOC's, nearly 160,000 individuals received 250,000 counseling interviews in 1965 — 133,500 for the first time. Moreover, with BES-sponsored training programs, such as Project CAUSE, stressing the more effective techniques of group counseling, increased use is being made of the group process. Nearly 1,000 group guidance sessions were held at the new YOC's in 1965.

As a means of working with a larger group of applicants, one Youth Advisor in the Berkeley, California, Center formed a discussion group of ten unemployed young men, most of whom were school dropouts, who meet regularly at the YOC to discuss their own problems and attempt to find solutions.

Counselors in the YOC in Portland, Maine, meet regularly through a Friday afternoon Counselor Case Conference with the personnel from other agencies such as the NYC, MDTA, Boys' Training Center, city and state health and welfare agencies and school guidance programs to discuss programs and individual cases.

Group guidance sessions held in the Washington, D. C., Center include giving information on government tests, how to obtain drivers' licenses and birth certificates, part-time schools and bus routes in the Washington areas.

It is becoming clearer each day that much of the success of the YOC program is due to the dedicated staff, particularly the recently trained, newly employed counselors, Youth Advisors and Community Workers. In many Centers they are contributing their services on evenings and weekends to help reach and counsel the youth they serve.

TESTING AND WORK TRYOUTS

Many youth can be guided to appropriate careers and jobs by the GATB and other tests developed over the years by the Employment Service. These tools are being used by the YOC staffs, who tested nearly 150,000 youth in 1965.

But for many non-verbal, alienated, failure-prone young persons, the traditional Employment Service tests are not suitable. Other tools, like the non-verbal intelligence tests given to 3,300 youth and the educational achievement tests given to more than 4,000 youth in YOC's in 1965, have been helpful in referring the disadvantaged to jobs and training.

Plans are underway for YOC's to adopt the method of work tryouts to evaluate the job potential of disadvantaged youth. Experiments in recent years involving State Employment Service agencies, private agencies and disadvantaged youth have shown the efficacy of this method, which will be introduced into selected YOC's during the coming year.

The work tryout or work sample technique will substitute job-related materials, tools and equipment of the type used in actual production, for paper and pencil tests. Its goal will be to expose the youth to a number of occupational tasks in order that his skills can be evaluated and a basis estab-

lished for determining instruction and counseling needs. It will also acquaint the youth with a variety of occupational tasks to be performed in a simulated work environment. In addition to producing performance ratings, the work sample method will enable the counselor to observe other job-related skills such as the ability to follow oral and written instructions, relationship with the instructor, interest in the task and the like. The work sample technique is expected also to prove useful as a vocational interest inventory since standard vocational interest tests have generally yielded rather flat profiles for disadvantaged groups. Finally, the relatively wide exposure to job tasks would serve as a useful training experience.

JOB DEVELOPMENT AND PLACEMENT

Statistics alone cannot begin to tell the story of how YOC efforts have brought new meaning to young persons whose lives have been a series of gray, grim and unhappy experiences on the streets of America or locked away within the walls of its institutions. Statistics cannot tell the story of the young man who reported to the YOC in Phoenix, Arizona, the day he was released after spending three years in a Federal prison camp for juveniles. In prison he had worked on the maintenance and operation of dry cleaning and laundry machines. Although he liked the work and said it gave him his first feeling of competence, he was apprehensive about applying for a job because of his record. Working in cooperation with the youth's counselor, a placement interviewer called on a number of cleaning establishments and was able to develop a job opportunity for him. He was accepted as a probationary employee and follow-up indicated that he is now a permanent employee with a promising future of increased responsibilities. The YOC has helped him find a new life.

Or how can figures alone tell the story of the 17-year-old lad in Wheeling, West Virginia, who was in jail with a long record of petty offenses — a potential hard-core criminal? Coming from a deficient home environment where his family had long been on welfare, the youth was brought to the attention of the YOC by a social worker and a minister. A YOC staff member discussed his case with the judge of the juvenile court and received permission to accompany him to the Armed Services Recruiting Offices. When the Navy was unable to accept the young man, he and the counselor turned to the Army recruiter. The youth passed all tests, and the recruiter agreed to enroll him, but only after a 60-day period of good behavior. The YOC arranged for placement in a foster home and temporary employment was found for him. At the end of 20 days, the YOC counselor found the youth performing well on his job, adjusting to the foster home and well on his way toward serving his 60-

day probationary period. The YOC counselor remains in continuous contact with the youth in order to assist him.

Or take the case of Jeff B., an unskilled, completely deaf, non-white newcomer to the Los Angeles area from Texas. Jeff thought he was doomed to the life and the precarious income of a janitor. But when he walked into the West Pico Boulevard YOC in Los Angeles, California, he was referred to a counselor who secured a job opening for him in a plastics factory. There he started as a machine operator trainee at $1.60 per hour. His employer reports that Jeff tries hard and learns well. The employer is learning sign language from Jeff.

Pamela P. was referred to the Los Angeles YOC by the medical social worker at General Hospital. Pam lives in a half-way house for the emotionally disturbed. She needed a job where she could work and continue therapy at the hospital each morning. She was referred by the Center to an assembly job on the swing shift at $1.50 an hour. She is doing well at her work and showing improvement in therapy. Pamela, too, is attaining a self-sustaining position in society.

Stop-gap jobs are also important. At the Central YOC in San Jose, California, counselors arranged employment for four non-English speaking applicants as sample distributors with Proctor & Gamble. Not only did this help them await an opportunity for training but it also gave them needed work experience. The employer was highly satisfied with their performance. This same Center also arranged for part-time employment with the local post office for a group of six male MDTA trainees. This work is providing these youth with excellent work experience relevant to their clerical training. They are looking forward to full time employment at the post office after completion of their MDTA training, and are receiving help from YOC personnel in filling out their Forms 57 and in preparation for their Civil Service examinations.

The San Jose Central YOC makes every effort to help applicants remain in school. When a San Jose high school sophomore told her school counselor about her very difficult home situation, the YOC was contacted. In consultation with the juvenile probation officer, the two counselors arrived at a solution through which the young woman could remain in school. The YOC interviewer arranged for her to take a live-in job. Her school grades have improved. Her future looks bright.

In response to the instructions to provide job development services so that the undereducated, unskilled and disadvantaged youth might find employment, the YOC's have done extensive work in seeking out and finding job

openings for youth. Over 30,000 job solicitation and 27,000 job development contacts were made from July through December, 1965.

The results of these efforts can be gauged by the fact that more than 100,000 youth placements were made during the first year of operation of the Centers. Some 73,000 were placed during the last six months of 1965. Farm placements accounted for only 3.0 percent of the 100,000 placements. Unskilled occupations led the field of nonagricultural placement, with 31.1 percent of applicants finding employment in them. Clerical and sales positions, comprising 30.7 percent of placements, were a close second, with 20.3 percent of the applicants taking jobs in the service trades.

In job placements by industry, wholesale-retail trade still leads, providing 28.6 percent of the total job openings in YOC's, with the service trades offering 25.9 percent. Government on all levels provided 19 percent, pressed by manufacturing with 18.9 percent of the total.

The total of all youth placed in nonagricultural employment in 1965 was 15 percent higher than the total of those placed during 1964. The gain was greatest among male youth, with 19 percent more being placed in 1965 than in 1964. These increases can generally be credited to the fact that 16 percent more youth applied to the Employment Service for jobs in 1965 than in 1964. It must be emphasized that while the placement rate of young people showed a 15 percent gain, during the same period the rate for all workers in the nonagricultural field decreased slightly. At the same time, adult job applications also dropped.

YOUTH SERVICES IN NON - YOC AREAS

YOC's are located primarily in metropolitan areas of the United States. To provide services for youth living in those areas not served by the YOC's, the Department of Labor has provided for special augmentation of employment service youth staff. In most cases, identifiable youth units are being established within the local offices. In other instances, area teams are being organized to take the youth services to communities where employment services are not available.

For example, the State of Maryland serves its Eastern Shore — an area traditionally devoted to fishing occupations with a "Caravan Office-on-Wheels." The "Caravan," equipped with 2 desks and a waiting area provides a place where youth can be interviewed in privacy. It shares jobs and training openings with local offices by means of a telephone which connects with all local office lines.

At least one "hero" has emerged as a result of the Eastern Shore project. He is a young man who recently completed training and who obtained work with a construction company outside the area — a rare accomplishment for these youth whose horizons have been limited to their own tight little community and its predominant trade of shell fishing.

The Maryland Caravan on Wheels is supplemented by mobile teams that penetrate the back woods areas of the state, often working out of tiny churches where pews are substituted for counseling booths.

In fiscal year 1966, the Department of Labor granted a total of 1,172 new positions to the States for augmentation of youth personnel in local offices. These youth services personnel receive specialized training along with YOC staff and, in so far as staff and facilities permit, provide the same intensive services to youth as are carried out in YOC's.

COORDINATION WITH OEO

The effectiveness of the YOC program depends, in large measure upon the coordination and mutual support of YOC's and the special programs for disadvantaged youth under the Economic Opportunity Act.

The YOC, through bringing together youth and the variety of work and training programs available to them, functions as a significant manpower arm in the War against Poverty. The range of opportunities provided to youth through the YOC enables it to tailor its services to fit the needs of the individual youth.

CAP

The Community Action Program (CAP), under the Office of Economic Opportunity, consists of comprehensive efforts at the local level, undertaken by communities themselves, to combat poverty by improving the conditions under which people live and work. The YOC program is closely coordinated with the CAP, both locally and at the national level.

In those cities where a CAP is well under way, either in planning or in implementation, a representative of the State Employment Service (usually from its top managerial staff) generally is on the local CAP board. In establishing the YOC, consideration is given to the CAP planning, whether advanced or in its initial stage, to assure a coordinated and integrated pattern of community services. In many cities YOC staff are outstationed in CAP neighborhood centers where they augment the role of the YOC in the total program of the community. This kind of coordinated effort on the part of the

YOC and the CAP assures full utilization of the existing services in the community and avoids wasteful overlap and duplication of services to youth. In cities where a CAP is not yet underway, the YOC retains sufficient flexibility to enable it to give supportive services to the newly emerging community effort.

Both the CAP and the YOC are new institutions. It is to be expected therefore, that as they take shape, tensions may develop between them. Actually, the two programs operate under different legislative instructions. The CAP deals with the poor; the Employment Service with the unemployed, including the poor. It may be difficult at the local level for the directors of the two programs to interpret to each other this basic difference in their objectives. What is sometimes viewed as an unwillingness to cooperate may in reality be a reflection of the agency's concentration on its own particular mandate.

MDTA

Referrals to three major training programs — MDTA, Job Corps, and NYC — are among the resources available to the YOC's to increase employability. They are using all three.

The YOC's were urged to refer applicants to the special MDTA projects for youth and to continue with job placement and follow-up responsibilities when training is completed. The guidelines also called for them to provide counseling and placement services as part of the special MDTA projects. In addition, they were asked to secure the additional special community services that trainees might need.

From July 1, 1965 to the year's end, over 11,000 YOC applicants were enrolled in MDTA training.

In Newark, New Jersey, one YOC applicant was unable to qualify for apprenticeship training because of his lack of education. He was placed in a nine-month MDTA machine-tool operating course. Upon the completion of the course, his skills were upgraded and he was able to qualify for a machinist apprentice opening at $1.75 per hour. After six months he was performing successfully on his new job.

The Hunters Point Center in San Francisco, California, has put much effort into helping MDTA youth become job-ready. Three MDTA courses have been offered in the clerical field. Several weeks before the courses were scheduled to end, the YOC began developing jobs for the trainees and agreed to test them to assess their newly acquired typing and spelling skills. The tests were aimed at giving the trainees experience in test-taking as well as giving the YOC an idea of their qualifications. The results of the first tests

were poor. It was suggested to the training facility that greater emphasis be placed on spelling and typing. Arrangements were made for retesting and for lengthening the course for some. Although this took extra effort on the part of both YOC and training staff, it gave the trainees a second chance and lessened the probability of turning out unqualified applicants who could not be placed.

As the present rate of unemployment continues to decline, the percentage of unemployed who are youth will sharply increase. Much more thought and effort still need to go into enrolling these unemployed into training programs.

Job Corps

A second training resource available to the Youth Opportunity Centers is the Job Corps. Credit goes both to the YOC's and local offices for screening 90 percent of nearly 52,000 male youth referred to the Corps during 1965. In those cities where YOC's are in operation, Job Corps screening is handled by the YOC; where the YOC's are not yet operational, the State Employment Service performs this function through its regular local offices. Under a recent agreement (Jan. 1966), the Employment Service will have the major responsibility for placing returning Corpsmen (both men and women) in jobs or in training programs.

NYC

During the July-December period of 1965, a total of 40,500 referrals were made to NYC projects. During the coming year, additional thousands of youth will seek entrance into the Neighborhood Youth Corps. YOC's have the major responsibility for screening out-of-school youth for NYC.

NYC, like Job Corps, is an OEO program. However, responsibility for its operation has been delegated to the Manpower Administrator. The YOC program operates under the guidance of the BES and provides manpower services to the NYC, as it does to the Job Corps. The fact that NYC and the YOC are both administered by the Department of Labor does not mean that they have been merged into a single program or that they will merge in the future.

One problem in getting youth to enroll in the NYC has been transportation. Many devices have been used to solve this problem. The Tampa, Florida, YOC reports that one NYC sponsor arranged a pickup point in the city and transported the young men from there to his State Park project several miles away.

The YOC in Las Vegas, Nevada, is one of those providing work stations for NYC enrollees in the Center itself. This provides other applicants with the opportunity to meet disadvantaged youth like themselves who are working and earning money. It increases the number of job sites in the area served by the YOC. Counselors are able to offer their services more readily and more often to the enrollees and the staff of the Center receive services which would not otherwise be available.

The NYC projects provide not only work experience but quite often there is an opportunity for the enrollee to further his formal education. One Center tells of a 16-year-old youth who was living with his parents and trying to complete high school. His father was unemployed and the family's sole income was his Unemployment Insurance check. The student felt that he either had to find part-time employment or leave school. The YOC representative contacted the youth's school and assisted in having him placed in an NYC in-school project. The lad is now continuing his education.

OTHER REMEDIAL PROGRAMS

Referral of applicants to remedial programs of various kinds has shown a steady increase during the life of the Centers. This is due to the fact that the YOC staff are becoming more familiar with the work of other assistance agencies in the community and are developing improved working relationships with them. In 1965, during the July-December period, 5,108 YOC applicants were referred for medical, rehabilitation, welfare or other remedial assistance. An additional 4,800 were referred to schools on either a full-time or part-time basis or to apprenticeship or vocational training. Most of these referrals have come as a result of consultations with psychologists, psychiatrists and social workers. The total number of such consultations from July through December mounted to almost 4,000.

Perhaps the most complete arrangements for remedial services have been set up by the Centers in New York City. They have arranged for complete medical check-ups, eye examinations and eyeglasses, an emergency shelter for homeless boys, chest X-rays and the on-premises services of a psychologist and remedial reading teacher.

VOLUNTEER AND COMMUNITY ACTIVITIES

Centers across the country report many examples of the use and value of volunteers and varying community activities. In some Centers (Wichita, Kansas, is one example), the WICS (Women in Community Service) are doing excellent volunteer work. A room on the second floor of this Center has been set aside for them. They have been very productive, interviewing 436 young

women of whom 51 have been accepted in the Job Corps. They also carry out conducted tours of industry and business and, at the request of one group of disadvantaged youth, arranged a tour of the Art Institute. The WICS brought in a beautician to talk to the young women about grooming. The manager is planning to involve other volunteers including groups of senior citizens.

What appears to be an ideal manner of combining volunteer work with a Center's outreach program has been set up in a low-income area of Honolulu. There the community workers operating out of the YOC have guided a group of 15 NYC enrollees, together with their NYC supervisor and an interested citizen, in forming a youth organization to meet some of their recreational, social and cultural needs. They plan dances, excursions, athletic events and participation in other community projects.

A great majority of applicants need help in making a good impression on potential employers. Their needs may vary from better clothing to grooming and from help in filling out application forms to simple verbal communication. To help fill these needs, several Centers have sought out volunteer assistance.

Clothing for needy applicants is being supplied by members of the Junior Chamber of Commerce in Akron, Ohio, and by merchants in Albany, New York. In Jamaica, New York, the Center staff themselves have collected and donated clothing for those applicants who need it. A women's club in Cleveland, Ohio, has raised funds in order to help those youth in greatest need who come into the Cleveland Center. The Center in Beckley, West Virginia, has arranged for the Toastmasters Club to supply an instructor for a heavily attended class in communications. In Atlanta, Georgia, the Uptown Business and Professional Women's Club has held Saturday sessions in grooming at the YOC. Many young women have greatly improved their appearance as a result of information which was not available to them before. Similar courses held at the Center in Wheeling, West Virginia, have included preparation for employment and remedial reading classes.

A mutually beneficial arrangement has been worked out by the YOC in Columbia, South Carolina, with a 19-year-old high school dropout. This young woman has been referred by the Center to an MDTA clerk-stenography training course. She is doing voluntary clerical work at the Center and gaining valuable experience in line with her training course. In addition, she is studying to take her high school equivalency examination as a result of the encouragement given her by the staff.

Two Master's Degree students at the State University of New York in

Buffalo, enrolled in a Rehabilitation Counseling Program, are doing volunteer work in the Buffalo YOC as part of their course internship requirement. They are as pleased with their opportunity as the staff is with their work.

In total, more than 16,000 man-hours of work were donated to the Centers by almost 650 volunteers during the last six months of 1965. Almost 2,500 meetings of various kinds have been held at Youth Opportunity Centers during this period and YOC staff have attended more than 2,700 meetings held outside the office. Professionals on YOC staffs have given some 1,500 talks to groups outside the YOC's and have made more than 4,700 visits to other agencies. These figures do not, of course, include visits to employers, schools, applicants and others, in line with staff duties.

The use of volunteers is limited only by the imagination and energy of each Center's staff. Volunteers are also available from the disadvantaged groups themselves. In those areas where indigenous non-professionals have been worked into the YOC program, it has been found that their ability to communicate with disadvantaged youth is excellent. The experience gained in the use of CAUSE II-trained Community Workers is perhaps the best example of the value of such non-professionals.

ADVISORY COUNCILS

Each Youth Opportunity Center is required to set up an Advisory Council "to give guidance to the Director in the operation of the Center and to assist in securing and maintaining the community support and cooperation which are essential for effective service to youth."

These advisory councils consist of approximately 25 persons, including representatives of schools; health and welfare agencies; employers; minority groups; unions; civic, service and professional organizations; neighborhood groups; Selective Service Boards; Community Action Programs; and other community agencies, organizations and resources.

The functions of the council and its committees include: liaison with the public, arousing public support, encouraging new youth services to be developed, obtaining commitments from employers, seeking the support of unions in developing opportunities for youth, assistance in removing artificial employment barriers, aiding the Center to play a role in the economic development of the community, improving the working relationships with community youth services, providing technical advice and assisting in recruiting qualified volunteers.

Usually the Director of the YOC is an ex-officio member of the Advisory

Council, with the Center's Community Relations Coordinator acting as its Executive Secretary. An auxiliary council of the youth themselves may be set up in order to get a flow of ideas from the young persons in the area, or they may be appointed to the Advisory Council itself.

Advisory council members may also be utilized as consultants. While consultants are contracted for on a regular basis for staff development and staff assistance, community resources are explored to determine the availability of needed services without cost. YOC consultants include educational specialists, psychologists, psychiatrists, social welfare workers, health specialists and others, as needed. The Centers also utilize the services of consultants in the fields of legal services and public relations.

EMPLOYABILITY PROBLEMS

Despite their many successes, the YOC's have had some problems. Many factors operate to decrease the employability of youth. Centers in bilingual areas have applicants who lack the ability to speak, read or write English. Basic educational courses, classes in remedial reading and communications, and similar programs are essential for these youth.

In St. Petersburg, Florida, the Center has been in contact with a 20-year-old high school graduate who has had no previous work experience. Troubled with obesity, this 295-pound lad finds it impossible to accept training for his chosen vocation of automobile mechanic for which he has also shown an aptitude. The counselor is persuading him to embark on a medically supervised diet and will make arrangements for referral to a mental health clinic, if necessary. The youth hopes to lose enough weight to allow him to enroll in an MDTA auto-mechanic course this fall. Here again is a case that needs continuous individual attention from the counselor.

Temporary employment for needy applicants ranges close to the top of the list of MUST items. In Phoenix, a part-time and temporary placement unit has been set into operation. In its report the YOC lists four main reasons for this activity:

1. Some clients need such employment to remain in school or while awaiting Job Corps or other assignments
2. Such work often opens the door to permanent jobs with the same employer
3. It gives less-skilled applicants a chance to polish their skills and test vocational choices
4. The employers find such services to be valuable.

As one means of developing more employer interest, the St. Louis, Missouri, YOC has started a postcard resume program. The card mentions the employer's past employment needs and suggests that he might wish to interview the youth in question. A brief one-paragraph resume follows. While the response has varied, signs point to a sharper interest on the part of many employers.

Several YOC's report a dearth of job openings for 16- and 17-year-old youth as well as for female applicants. Applicants with arrest and conviction records frequently have difficulty in finding employment. This sometimes is due to difficulty in bonding such persons as well as to apprehension on the part of many employers over accepting a "criminal" in their work force. Imaginative and persistent deliberations are called for in cases such as this. Continuous contact must be maintained with those applicants who are accepted by employers.

STAFF TRAINING

The effective work of the YOC's is, in turn, proving the value of the CAUSE training programs of 1964 and 1965. The principal reason for the CAUSE training was to meet the urgent present and prospective demand for qualified staff to work with youth and help them achieve parity in the nation's economy. It was designed not to supply fully trained counselors, but to provide the trainees with sufficient skills in the techniques of counseling to enable them to establish rapport with disadvantaged young persons and channel them into opportunities that would increase their employability. CAUSE came on the heels of widespread criticism of both the quality and quantity of counseling in the Employment Service.

The CAUSE I program produced 1,725 Department of Labor certified trainees. More than 1,000 of these were employed for work in YOC's and youth units of the Employment Service following completion of their training in September 1964. The CAUSE trainees were generally retained in local offices pending opening of the YOC to which they were assigned. The first YOC became operational in February 1965 and by the end of the fiscal year, only 31 YOC's were open.

A BES survey of counseling personnel showed that, as of October, 1965, 953 CAUSE trainees were employed as counselors alone, 540 of whom were employed in YOC's. The survey did not include CAUSE trainees employed as Youth Advisors, Community Workers, Interviewers or in other titles (one CAUSE trainee is a YOC manager).

As of April, 1966, 1,060 of the 1,561 certified CAUSE II trainees had been hired by the Employment Service and an additional 158 had been hired by other agencies in training related jobs. Thirty-six were not available because of military service, return to school or other reasons.

The 1964 CAUSE program trained for 2 categories—Counselor Aides and Youth Advisors. The 2 classes met identical selection requirements and received the same training, with one exception: Counselor Aides were college degree holders and Youth Advisors had not completed college. The 1965 CAUSE program trained 3 classes—Master's Degree Counselors, Counselor Trainees and Community Workers.

The Community Workers were recruited locally by the Employment Service in consultation with community leaders in disadvantaged neighborhoods. Educational requirements were minimal; however, selectees were required to be indigenous to the community in which they would work. They were trained separately in programs developed especially for the purpose, at the National Federation of Settlements in Philadelphia, Pennsylvania, and Cincinnati, Ohio; at the Youth Opportunity Board in Los Angeles, California, and at two universities. A total of 144 persons were trained as Community Workers, more than half of whom are employed in YOC's.

Both Community Workers and Youth Advisors function as outreach personnel. They were trained on an experimental basis to help determine the desirability and usefulness of employing sub-professionals in the YOC program. A question that has frequently arisen with regard to these two classes is the question of promotion. One avenue of advancement would be through additional academic accomplishment to enable them to meet Civil Service and State Merit System requirements for higher level positions. Youth Advisors are better able to advance in this manner since most of them had some college training and all were high school graduates. A second would be through the establishment by Civil Service and State Merit Systems of separate, distinct classes, with their own levels of advancement. The question has not yet been settled. In fact, in some States, Civil Service and Merit Systems prevent the hiring of either class on a permanent basis. In a few of these States, Community Workers have been hired on a contract basis.

Two research studies presently underway hopefully will give us some guidance on the problems of both the Community Worker and the Youth Advisor. The BES is making a study of the utilization of outreach personnel in the Employment Service, which consists almost entirely of Community Workers and Youth Advisors. The preliminary phase of a special research project, designed to followup on the CAUSE programs, is being carried out

by American University. This study will focus on the CAUSE trainees and their adjustment to and effectiveness in the YOC program.

Each of the 132 YOC's has several CAUSE graduates on its staff. Forty percent of the staff are former Employment Service personnel. Many of the Centers report planned programs for in-service training and development, especially for counselors. The Wichita YOC reports that 44 percent of their staff are enrolled in out-service training. They also report that they have been able to bring in authorities in such fields as alcoholism and mental illness to participate in their in-service training programs.

PROBLEMS

Like any new program, the YOC's have not been without problems. In addition to the usual "growing pains," however, a number of problems stem from the fact that the YOC has introduced a new concept of client service into the public employment service system. In contrast to the traditional concept of matching workers to jobs, the YOC looks at the whole youth, determines what services are needed to increase his employability and then attempts to provide these services through its own resources and those of the community. Intensive counseling, testing, and referrals to remediation, rehabilitation, training or jobs are tailored to the needs of the individual youth. Present trends are toward the embodiment of the YOC concept in services not only to youth but for adults as well. The following are some of the problems the YOC's are presently facing:

Delay in starting. The YOC's got off to a slow start. Many state agencies were reluctant to accept the radical new program. A series of conferences throughout the nation helped convince administrative and supervisory personnel of the need for and the value of the program. Most are now enthusiastic about the YOC's and proud of their accomplishments.

Nevertheless, the delay in starting meant that the CAUSE trainees, many of whom were impatient to begin their work with disadvantaged youth, were stockpiled in regular local offices until the YOC's became operational. During the interim, many of these eager, dedicated, young persons left the Employment Service for jobs in other agencies and were lost to the YOC's.

Overburdened Staff. The contemplated expansion of YOC staff during the second year of program operation did not materialize. Most of the centers have had a very large volume of applicants, with peak loads during the summer months. These two factors together make for a greatly overburdened staff in virtually all YOC's. As a result, counseling cannot be provided on the intensive basis needed by many youth. In some cases, appointments

must be scheduled weeks ahead and, inevitably, youth who need the services must go without them. To help alleviate the shortage of staff time, more training in group methods is being provided and audiovisual aids are being prepared as holding devices for youth who must wait for counseling and other services.

Job Corps and NYC. Job Corps, NYC and the YOC's all became operational about the same time. In addition to the YOC's "growing pains," it has shared the beginning problems of these OEO programs as well. Both NYC and Job Corps, in their eagerness to fill existing "slots," have set quotas which the YOC's and local offices of the Employment Service have attempted to fill. The idea of quotas has at times threatened to interfere with the basic premise of the YOC program, which is to tailor the services to the individual needs of the youth. We would like to get away from quotas and refer youth on the basis of individual need. NYC has moved more rapidly in filling its projects than Job Corps has moved to fill its conservation and urban centers. However, during the coming fiscal year, Job Corps will very probably increase its enrollees to capacity. When this has been accomplished, assignments can then be regularized and the pressure of quotas should correspondingly decrease.

Follow-up. Admittedly, follow-up on YOC applicants referred to jobs and training has lagged behind. From July 1 through March 1966, although 80,705 YOC applicants were placed in jobs for the first time and all job placements totaled 155,160, only 31,407 instances of youth follow-up were reported. Routinely, the employment service placement interviewer follows-up with the employer on job referrals. However, follow-up on applicants referred to jobs, testing, or other services has not been traditional with the Employment Service. In addition, there is a need to follow-up on youth who do not return to the YOC to keep appointments. In those YOC's where Community Workers are employed, some of this is being done.

Volunteers. The guidelines for YOC's call for recruitment, training and utilization of volunteers to assist the regular staff and to carry out duties which would not otherwise be performed. Volunteers could, for example, do follow-up and outreach, assist in screening for NYC and Job Corps, help conduct group sessions and the like. However, a lack of experience with volunteers in the Employment Service has apparently created a reluctance on the part of YOC supervisory staff to utilize their services. We are hopeful that with additional guidance from the national office we can increase the use of volunteers in our YOC's.

Confidentiality of Records. The coordination of the YOC program with other anti-poverty programs creates a problem of sharing records on youth

applicants. As YOC's increasingly adopt the caseload approach, the accumulation of confidential information about a youth will increase. Referral of YOC clients to other agencies for services not available at the Center calls for interchange of information between these agencies and the YOC's.

Employment Service policy has generally been that for those agencies with which a cooperative relationship exists and which also are helping persons, information about the applicant will be provided. The information may be given over the telephone or it may be in the form of a written statement. Operating records, such as application and counseling cards, are not transferred to other agencies since they contain information about the applicant which may be of concern only to the Employment Service. Only pertinent, needed information is given.

It should be added that efforts are underway not only to correct the deficiencies of YOC's, but to introduce into them new programs and services that will increase their effectiveness.

As he dedicated the Twin Cities Center in Minneapolis on July 6, 1965, Vice-President Humphrey stated, "What does this Youth Opportunity Center offer? It offers what one boy told me not long ago: 'It was my last chance.' This Youth Opportunity Center is open to all who need it. The door here will always be open."

*YOUTH PROGRAMS; *DISADVANTAGED YOUTH; *FEDERAL LAWS; *EMPLOYMENT PROGRAMS

When the Office of Economic Opportunity issued its "Catalogue of Federal Programs for Individual and Community Improvement" on December 15, 1965, it listed 250 different federal programs. At least 35 of them are potentially applicable to youth-work programs seeking to increase the employability and employment of disadvantaged youth. The planner of a youth-work program must seek to utilize all the available legislation to help build a comprehensive program. The purpose of this paper is to describe the major relevant federal legislation. It gives the intent of the legislation, what it makes possible, who allocates funds, and who can apply for and receive funds. Included are: (1) The Job Corps, Neighborhood Youth Crops, Community Action Programs, Adult Basic Education Programs, and Work Experience Programs of the Economic Opportunity Act, (2) Manpower Development and Training Act, (3) Vocational Education Act of 1963, (4) Federal-State Employment Service based on the Wagner-Peyser Act of 1933, (5) Vocational Rehabilitation Act, (6) Health Care--Social Security Amendments, (7) Elementary and Secondary Education Act of 1966, (8) Civil Rights Act of 1964, and (9) Juvenile Delinquency and Youth Offenses Control Act. FEDERAL LEGISLATION FOR A COMPREHENSIVE PROGRAM ON YOUTH EMPLOYMENT

INTRODUCTION

Congress has passed many different laws dealing with manpower, employment, unemployment and related problems. When the Office of Economic Opportunity issued its **Catalogue of Federal Programs for Individual and Community Improvement** on Dec. 15, 1965 it listed 250 different federal programs administered by 16 different government agencies. At least 35 of these are potentially applicable to youth-work programs seeking to increase the employability and employment of disadvantaged youth. Commenting on the complexity of manpower legislation generally, Yale Professor E. Wight Bakke recently wrote that "when . . . we survey the vast dispersion of these tasks that fall logically and necessarily under the employment and manpower umbrella, the first inclination is to throw up our hands in despair at ever achieving any integrated direction and coordination. . . ."[1]

But the planner of a youth-work program cannot "throw up his hands in despair". He must seek to utilize all the available legislation to help build a coherent and comprehensive program. The purpose of this paper is to help him by describing the major relevant federal legislation. It is written to indicate the intent of that legislation and what it makes possible, who allocates funds, and who can apply for and receive funds. It makes no attempt to go beyond the specific terms of the laws to deal with the highly relevant and practical administrative regulations and practices putting them into effect. This is not intended to be a "how to do it" paper.

Not every federal law with a conceivable effect on youth employment is included. But all the major pieces of federal legislation are described. No attempt has been made to include state and local legislation.

Some of the Congressional enactments are vague and leave to administrative clarification such matters as the specific definition of "poverty", allowances for Job Corps enrollees, or the responsibility for operating the Neighborhood Youth Corps. The very vagueness of the legislation can often be turned to advantage by achieving its most advantageous specific application. Some of the legislation described cannot be utilized directly by community manpower or youth-work officials. But even in this case, knowledge of these laws is essential for the youth-work planner if he is to realize the full

1 Bakke, Wight E., **A Positive Labor Market Policy**, Charles E. Merrill Books, Inc., Columbus, Ohio (1963) p. 149.

potential of cooperating agencies, and perhaps to help create new policies and legislation in the services of a complete program for youth employability and employment.

ECONOMIC OPPORTUNITY ACT — THE ANTI-POVERTY PROGRAM

The main purpose of the Economic Opportunity Act is well known. The principal means of eliminating "the paradox of poverty in the midst of plenty" is stated to be "opening to everyone the opportunity for education and training, the opportunity to work. . . ." Emphasis is on youth employment and Title I of the Act deals with "Youth Programs".[2]

The Job Corps

The Job Corps is aimed at a particular hard-core of disadvantaged youth who need a "change in surroundings and associations" in order best to receive "education, vocational training, useful work experience" that will increase their employabliity and prepare them "for the responsibilities of citizenship".[3] For this purpose the OEO Director is to set up a series of conservation camps and urban residential centers where work and training, health, education, and counseling services will be provided.

The OEO Director is authorized to prescribe the eligibility standards for Job Corps enrollees aged 16 through 21, and is given wide latitude in making arrangements for "any federal, state, or local agency or private organization"[4] to establish and operate Job Corps centers.

The law requires that 40 percent of the male Job Corps enrollees must be assigned to "Youth Conservation Corps" camps engaged in conservation of natural resources. Job Corps enrollment can be for 2 years. In addition to all living and transportation costs, the OEO Director may provide Corps enrollees with an allowance which he deems "necessary or appropriate for their needs". Each youth on leaving the Corps is to receive $50 for each month of "satisfactory participation". Although not in the law itself, Congress expressed its intent that at least one-third of the Job Corps enrollees should be young women.[5]

2 "The major part of the war on poverty . . . is that part which involves the problem of finding jobs for young people, especially those who have been born into the world of poverty, and have no way out save through education, training and a decent job . . ." Secretary of Labor Willard Wirtz at the House Education and Labor Committee Hearings on Economic Opportunity Act, March 19, 1964.

3 **Economic Opportunity Amendments of 1965,** House Committee on Education and Labor, Report No. 428, May 27, 1965, p. 2.

4 Unless otherwise indicated, quotations are from the text of the legislation being discussed.

5 **Economic Opportunity Amendments of 1965,** op. cit., Report No. 428, p. 3.

At the beginning of May, 1966 there were 99 Job Corps centers in operation serving 24,017 youths of a reported 287,911 eligible "Job Opportunity" application cards received.[6] The President's 1967 Budget Message states that the "capacity" of the Job Corps in fiscal 1967 will be 39,000 young men and 6,000 young women. That Message estimates Job Corps costs as $240 million in fiscal 1966 and $350 million in fiscal 1967, which suggests a Job Corps average enrollment of 25,000 during the year ending June 30, 1967.

The Neighborhood Youth Corps

The Neighborhood Youth Corps — designated as "Work-Training Programs" in the Economic Opportunity Act — has the purpose of increasing employability of jobless youth and the resumption or continuation of school attendance of high school dropouts or potential dropouts. Socially useful jobs on either public or non-profit private projects are to be combined with "vocational training and educational services". Jobs with "high training potential" are to be given priority and both work experience and training is to be in occupational skills with "a reasonable expectation of employment".

The OEO Director is to cooperate with state and local agencies and with private non-profit organizations to set up Neighborhood Youth Corps, and is to make agreements with such units to pay "part or all of the cost" of the program. (The Director of OEO has delegated responsibility for the NYC program to the Secretary of Labor.) The law provides that NYC enrollees shall be aged 16 through 21, and their participation must be "consistent with the purposes" of the Economic Opportunity Act. The Director is to assure that rates of pay and conditions of work are "appropriate and reasonable".

The law emphasizes that NYC enrollees should be provided with vocational and educational services, with testing, counseling, job development, and referral services. If these are inadequately available, the program may make special arrangements for these supplementary services. Distribution of NYC funds among the States is to be "equitable" with no state getting more than 12½ percent of the total.

The President's 1967 Budget Message reports that NYC will provide 125,000 part time jobs during the next school year, 165,000 jobs during the summer, and "the equivalent of 128,000 work and training positions of 6 months duration" for "out-of-school unemployed youth".

6 **A News Summary of the War on Poverty,** Office of Economic Opportunity, May 2, 1966, p. 4.

COMMUNITY ACTION PROGRAMS (CAP)

The Community Action Programs (Title II-Part A of the Economic Opportunity Act) are to help "urban and rural communities mobilize their resources to combat poverty". While the CAP is not solely concerned with youth-work or other manpower programs, the law clearly directs CAP toward this activity. A "Community Action Program" is defined as one which, among other things, "provides services, assistance, and other activities . . . [that] give promise of progress toward elimination of poverty or a cause or causes of poverty through developing employment opportunities, improving human performance, motivation, and productivity . . ." In outlining the components of a CAP program which justify the OEO Director in making CAP grants to "appropriate public or private non-profit agencies", the Act lists "employment, job training and counseling, health, vocational rehabilitation, housing, home management, welfare, and special remedial and other non-curricular educational assistance . . ."

This language authorizes CAP to make arrangements for and help fund many components of a comprehensive youth-work program. The OEO Director is mandated to give preference in the allocation of all assistance under the Act to programs and projects that are integral parts of the CAP. The Community Action Program is to be "developed, conducted, and administered with the maximum feasible participation of residents of the areas and members of the groups served". Grants and/or contracts with public agencies, universities, and private organizations to develop research, training, and demonstration projects are authorized up to a total of 15 percent of total CAP appropriations.

Adult Basic Education Programs

As part B of the Title II—Urban and Rural Community Action Programs—there is provision for programs of instruction in English language literacy to serve "adults", defined as "individuals who have attained the age of eighteen". The purpose is employability of such "adults" through elimination of their "inability to read and write the English language [which] constitutes a substantial impairment of their ability to get or retain employment commensurate with their real ability . . ."

The OEO Director is mandated to grant funds covering 90 percent of all the costs to states which have developed plans approved by him to carry out the adult literacy purposes of the Act. Such approved plans are to be administered by the appropriate "State Educational Agency". Allotments to states shall be on the basis of the relative proportions between states of their population which have "attained age eighteen and who have completed not more than five grades of school . . ."

One of the statutory conditions for approval of a state adult basic education program is that it "provides for cooperative arrangements between the State Educational Agency and the State Health Authority looking toward provision of such health information and services . . . as may be available" and "reasonably be necessary" to enable those receiving the literacy instruction to "benefit" from that training.

This opens a door to remedial education and health service for functionally illiterate youth who are school dropouts and over 17 years of age. The President's 1967 budget contemplates provision of basic education to 75,000 adults through $30 million in grants to states under this program.

Total spending for the Community Action Programs, including Project Headstart and the Adult Literacy Program, is scheduled by the Administration's proposed budget to increase from $491 million in fiscal 1966 to $710 million in fiscal 1967.

Special Work Experience and Training Programs for Jobless Welfare Recipients

The Economic Opportunity Act (Title V) "Work Experience Programs" continues and extends the program initiated in the 1962 Amendments to the Social Security Act to provide "constructive work experience and other needed training" to jobless persons receiving public assistance. OEO funds — $150 million was authorized for fiscal year 1966 — are transferred for this purpose to the Secretary of Health, Education, and Welfare who administers the program in cooperation with state welfare departments. He is to finance experimental, pilot, and demonstration projects to advance the aim of assisting public welfare recipients towards "capability for self-support or personal independence".

This section of the anti-poverty program is directed towards the hard-core unemployed. There are no age limits and its terms could be applied to young persons in welfare families, whether or not they are heads of the family. At the beginning of May, 1966, there were 58,755 participants in the program.

MANPOWER DEVELOPMENT AND TRAINING ACT

The Manpower Development and Training Act of 1962, as significantly amended in 1963 and 1965, with an estimated expenditure for its purposes in fiscal 1966 of $279 million is a major component of the national manpower policy and program. As stated by the House Education and Labor Committee Report on the 1965 MDTA Amendments, "The primary emphasis

of the Manpower Development and Training Act, from its beginning, has been upon the training and retraining of unemployed adults with substantial past employment experience. This continues to be the proper emphasis, in the view of the Committee".[7] In the MDTA legislation Congress has primarily reflected its concern over "shifting employment needs" due to automation, other technological developments and "changes in the structure of the economy"; to the consequent displacement of experienced workers; and to the development of shortages of skilled manpower.

While there has been a steadily increased emphasis on disadvantaged youth, the fact remains that the law restricts the participation of young persons in MDTA. The law now allows 25 percent of the participants who receive training allowances to be youths aged 17 to 22. This will permit MDTA training allowances for approximately 31,000 youth aged 17 to 22 during the current (1966) fiscal year. On the reasonable assumption that the amount of the average adult training allowance is more than double that for youth, 10 to 12 percent of MDTA training allowance funds can go to needy jobless youth. This would amount to approximately $21 million a year.[8]

In his report on "Manpower Requirements, Resources, Utilization, and Training" transmitted to Congress in March, 1966, the Secretary of Labor reported that 43,200 youth (16 to 22) were enrolled in MDTA institutional programs and 4,000 were on OJT projects. Youth made up 42 percent of all MDTA classroom trainees and 39 percent of all on-the-job trainees in 1965.[9]

MDTA provides for two main types of training: **One**, so-called institutional training carried on in regular classrooms or training centers; **Two**, on-the-job training under agreement with private employers or other suitable groups.

Institutional training is of several types. The basic category is training in an occupation for which the Secretary of Labor has determined "there is a reasonable expectation of employment". When the Secretary of Labor decides that some eligible persons need basic education before they can pursue their desire for occupational training, he can refer them to special

7 **Manpower Act of 1965,** House Report No. 170, March 15, 1965, p. 22.

8 "There is no intention to change present policies with respect to the enrollment of youth in the MDTA program. Since the Act was last amended, in 1963, to increase effectively the proportion of youth trainees, Congress has enacted the Economic Opportunity Act. The NYC, Job Corps and other programs authorized by this recent Act provide extensive new work and training opportunities for youth. Accordingly, the committee reaffirms its support for a policy of maintaining a reasonable limitation on the proportion of youths in the MDTA program". **House Committee Report,** op. cit., on 1965 MDTA Amendments, p. 21-2.

9 **Manpower Report of the President, and a Report on Manpower Requirements, Resources, Utilization and Training,** U. S. Department of Labor, March 1966, p. 97.

preparatory classes. Finally, the Secretary can establish a "special program for the testing, counseling selection, and referral of youths, sixteen years of age or older, for occupational training and further schooling". The Secretary is also to provide counseling, placement, and follow-up studies for those who have completed their training.

All unemployed over fifteen who need training to get a job are eligible to MDTA programs. Training allowances are available to unemployed persons who have worked at least two years. The allowances can equal the average unemployment compensation payment in the state, plus $10 per week, plus maximum allowances of $20 for six dependents. Each trainee can also work for pay on a regular job for 20 hours a week without reducing his allowance. Under certain circumstances transportation and subsistence payments are allowed.

MDTA training payments can be made for one hundred and four weeks. This long period was provided to meet the special needs of trainees preparing for very technical skilled occupations and for the particularly disadvantaged who need extensive remedial basic education prior to regular occupational training.

Youths aged 17 to 22 — those trainees aged 16 are excluded — may also receive training allowances up to $20 a week if the Secretary of Labor decides they need it in order to undertake training. The Secretary of Labor must "satisfy himself" that the youth trainee is a bona fide "dropout" from high school.

The Secretary of Labor carries the main federal responsibility for MDTA. He is to make arrangements with each state "or with the appropriate agency in each State" to set up both institutional and on-the-job training programs. On OJT, the Secretary can also make agreements for training programs with "private and public agencies, employers, trade associations, labor organizations and other industrial and community groups . . ." Training allowance payments are to be handled by each state under agreement with the Secretary of Labor.

Persons to be trained are referred by the Secretary of Labor to the Secretary of Health, Education, and Welfare who in turn makes agreements of two types: regular occupational training agreements are made with "the appropriate State vocational education agencies" to do the training; for basic education prevocational training the HEW Secretary makes arrangements with the "appropriate education agency". If the state does not make an agreement with HEW, or if it does not provide required training, the Secretary of HEW can contract for it with public or private training institutions.

The Secretaries of Labor and HEW apportion MDTA funds between states according to a set formula based on proportions of jobless and labor force. These funds can be reapportioned when any state has not used its share. The law also provides that, with Bureau of Budget approval, MDTA funds can be transferred among different departments and agencies of the government, provided they are used for MDTA purposes. Until July 1, 1966 all costs of all MDTA programs are paid by the federal government. Thereafter, each state is to pay ten percent of the training costs, except that all training allowances will continue to be funded entirely by the federal government.

Projected MDTA spending in fiscal 1967 is about the same for fiscal 1966 — rising from $279 million to $282 million next fiscal year. The President in his Budget Message stated that "In 1966 and 1967, this program [MDTA], is being redirected to concentrate on workers who have little or no skills. Two-thirds of the estimated 250,000 trainees in 1967 will be drawn from this group of workers, who generally are least able to take advantage of the job opportunities of our prospering economy".

Under the MDTA legislation, the Secretary of Labor is authorized (with the consultation of the Secretaries of HEW and Commerce, and the OEO Director) to establish "experimental, developmental, demonstration, and pilot projects" through grants or contracts with public and private organizations to explore improved methods of meeting the training, employment, and manpower problems of worker groups, including disadvantaged youth and minority groups. The Office of Manpower, Planning, Evaluation and Research (formerly OMAT, now OMPER) of the Labor Department administers this program. Demonstration projects to increase worker mobility by assisting in meeting relocation expenses are also authorized.

VOCATIONAL EDUCATION ACT OF 1963

Under the Vocational Education Act of 1963 the federal government, through the U. S. Commissioner of Education in the Department of Health, Education, and Welfare, makes grants to states to subsidize their vocational education programs. In this 1963 Act, the system of federal aid to state vocational education was modernized and enlarged to subsidize all non-professional occupations training that is "realistic in the light of actual or anticipated opportunities for gainful employment". It introduced new attention to training of disadvantaged youth and provides a program of part-time employment to youths who need such income supplement to continue vocational education.[10]

10 The Federal Vocational Education Assistance Program had, prior to 1963, been based on the Smith-Hughes Act of 1917 and the George-Barden Act of 1946. Federal aid was limited to training for specified occupations, and almost two-thirds was for agriculture and home economics. See U. S. Department of Health, Education, and Welfare, Office of Education, **Digest of Annual Reports of State Boards of Vocational Education**, 1961, Table 3, p. 7.

The following statement in 1963 by the House Committee on Education and Labor which handled the MDTA and Vocational Education legislation clarifies the purpose of both Acts: "The Committee is aware some question may be raised as to the relationship of MDTA to the Vocational Education Act of 1963. That there may be an overlap is apparent only under superficial examination. Historically, vocational education has been available throughout the country for many years. But it had little impact upon training of the displaced unemployed for the simple reason that no adequate means were available to maintain the financial support needed by a breadwinner for his family during the period needed to complete his training. The [MDTA] Act passed by the Congress last year was primarily to plug this void. Some 60 percent of its appropriations is spent for training allowances alone. It covers training costs, but normally these are costs of special courses set up for full-time training outside the normal operations of vocational education. Moreover, new or expanded vocational training facilities cannot be provided under MDTA. Therefore, sums spent on vocational education are complementary to the MDTA programs . . . since additional facilities provide more opportunity for meeting effectively the training needs of the unemployed under MDTA".[11]

Federal Vocational Education aid is authorized for high school classes, for full-time vocational education of those out of school, for upgrading employed workers, for construction of facilities, for education of "persons who have academic, socio-economic, or other handicaps that prevent them from succeeding in the regular vocational education program", and for "ancillary services and activities to assure quality in all vocational education programs . . ."

Mandatory provisions of a federally approved and funded State Vocational Education plan require that one-third of the alloted funds be used for education of out-of-school jobless and/or construction of new facilities, and that 3 percent of the funds be used for "ancillary services". Also required is assurance that "all persons in all communities of the State will as soon as possible have ready access to vocational training suited to their needs, interests, and ability to benefit therefrom". A cooperative arrangement with the State Employment Service regarding labor market information and vocational guidance and counseling is required.

Allotments to the states are made by the U. S. Commissioner of Education on the basis of population proportions weighted to emphasize that proportion under 19 years of age. Re-allotment of unused state allocations is provided. Ten percent of the appropriation for Vocational Education (auth-

11 **Amendments of Manpower Development and Training Act of 1963, House Committee on Education and Labor, Report No. 861, Oct. 18, 1963, p. 4.**

orized to be $118,500,000 during the current fiscal year) is to be used by the Commissioner to make grants to colleges and universities and other public or non-profit private agencies and institutions to pay the costs of "research and training programs, and of experimental, developmental, or pilot programs . . . to meet the special vocational education needs of youths, particularly youths in economically depressed communities who have academic, socio-economic, or other handicaps that prevent them from succeeding in regular vocational education programs".

The 1963 Act includes two new programs aimed at disadvantaged youth. The first is a "work-study program" for students in an approved vocational educational program. Using an allotment formula based on proportions of the population aged fifteen to twenty, the Commissioner can assign funds to each state to pay for up to fifteen hours of work each week by students. The part-time jobs must be for a local educational agency or some other public unit. Total pay is limited to $45 in any month or $350 per year. Such part-time work will be available only to needy, full-time vocational education students aged 15 to 21. This plan is to be administered by the State Vocational Education Board, which is also the applicant for aid.

The second special program authorizes grants to set up and operate residential vocational education schools for youths aged 15 to 21 "who need full-time study on a residential basis in order to benefit fully from such education". As yet, funds have not been appropriated for this program.

Two special vocational education programs are illustrative and warrant mention. **Practical Nurses Training**: Included in the appropriations for Vocational Education in fiscal 1966 is $5 million earmarked for training of practical nurses and other "health occupations" as established in George-Barden Vocational Education Act of 1946. Special state plans organized by either the State Board of Vocational Education or the State Education Agency are required to qualify for allotment from this fund by the U. S. Commissioner of Education.

In fiscal 1965 there were 66,772 enrolled in practical nursing and related health occupation courses. Five million dollars was authorized for these courses in 1965, and $4,535,000 was spent. The states are required to match federal funds on a 50-50 basis.[12]

The Nurse Training Act of 1964 provides funds to facilitate training of professional nurses and nursing teachers and supervisors. The Public Health Service administers the program.

12 **Digest of Annual Reports of State Boards for Vocational Training**, U. S. Office of Education, Division of Vocational and Technical Education, 1962.

Fishing Trades: The fiscal 1966 vocational education appropriation also includes $375,000 to train fishing industry personnel. The Commissioner of Education makes the appropriations "on an equitable basis" after consultation with the Secretary of the Interior. In 1962 the federal expenditure for such training was $93,725, out of total federal-state-local expenditure of $233,349.[13]

FEDERAL-STATE EMPLOYMENT SERVICE WAGNER-PEYSER ACT OF 1933

The public employment system is a combined federal-state relationship based on the Wagner-Peyser Act of 1933. It is actually a dominantly state apparatus with complete federal financing and limited federal supervision and direction. Dr. Garth L. Mangum, when he was Research Director of the Senate Subcommittee on Employment and Manpower, wrote that "Because of the history of State initiative and because of the peculiar Federal-State structure of the American government, labor market placement services in this country are primarily a State and local function with financial support and some coordination from the Federal level . . . Any attempt to appraise the functioning of public employment services in the United States must focus on the State agencies . . ."[14]

Under the Wagner-Peyser Act $492 million was granted by the Federal Budget in fiscal 1966 to finance 2,000 Employment Service offices in the 50 states. In this public employment service system are the main resources available for testing, counseling, and job referral. The responsibilities of the United States Employment Services are specified in the Wagner-Peyser Act as:

> "It shall be the province and duty of the Bureau to promote and develop a national system of employment offices for men, women and juniors who are legally qualified to engage in gainful occupations, including employment counseling and placement services for handicapped, etc. . . . The Bureau shall also assist in coordinating the public employment offices throughout the country and in increasing their usefulness by developing and prescribing minimum standards of efficiency, assisting them in meeting problems peculiar to their localities . . ."

Although the Employment Service operated a special "Junior Placement Service" during the '30's, little attention was paid to young entrants into

13 **Ibid**, p. 177, 1962 Reports.

14 **The Labor Market Role of the State Employment Services**, Senate Committee on Labor and Public Welfare, Jan. 24, 1964, p. 1-2.

the labor force in the intervening years. During 1965 the U. S. Employment Service moved to step up its youth services and set up a number of Youth Opportunity Centers. The Labor Department says, "These Centers form the core for assisting the youth of the Nation to find suitable employment — here they will go to be tested, counseled, and referred to a job or to training for whatever skill they need . . ." President Johnson in his 1967 Budget Message has requested an additional $40 million for the Employment Service, in large part to operate 139 YOC units for "improved employment services for disadvantaged youth" in major metropolitan areas.

In September, 1965, the Secretary of Labor appointed a special task force of experts to study the Service and make recommendations for improvement. The task force urged that more attention should be given to "the provision of special counseling, job development, and placement services for young, inexperienced persons . . ." and that "technical assistance and administrative support" should be given to other government agencies in the manpower field such as the Neighborhood Youth Corps and the Office of Economic Opportunity. Congress is considering, in the current 1967 session, proposed legislation to amend the Wagner-Peyser Act "so as to provide for more effective development and utilization of the Nation's manpower resources by expanding, modernizing, and improving operations at both State and Federal level . . ."[15]

VOCATIONAL REHABILITATION

The Vocational Rehabilitation Act, importantly amended in 1965, provides federal assistance to state rehabilitation programs. The target population of this legislation are severely handicapped individuals who need special care "so they may prepare for and engage in gainful employment to the extent of their capabilities". The availability of this service is important to a youth-work program as an auxiliary resource to which a particular portion of disadvantaged youth can be referred. It can relieve projects such as the Neighborhood Youth Corps and regular training programs of the need to try to accommodate youth requiring very special vocational services.

The law defines the term "physically handicapped" as meaning "any individual who is under a physical or mental disability which constitutes a substantial handicap to employment, but which is of such a nature that vocational rehabilitation services may reasonably be expected to render him fit to engage in a renumerative occupation".

The Secretary of HEW is authorized to make grants to state vocational

15 Senator Joseph Clark (D-Penna.) on the introduction of proposed amendments to the Wagner-Peyser Act, Congressional Record, Feb. 24, 1966, p. 3751.

rehabilitation agencies to assist them in conducting and extending their state programs, and for research and demonstration projects. The federal share, beginning in fiscal year 1967, is to be 75 percent of total vocational rehabilitation costs. The fiscal 1966 federal expenditures are estimated to be $215 million, a large increase from the fiscal 1965 actual expenditure of $137 million. Estimated expenditures for fiscal 1967 are $314 million. It is anticipated that 215,000 handicapped persons will be rehabilitated in 1967, 25 percent more than in 1966.[16]

Handicapped persons who are disadvantaged in their job prospects are eligible for vocational rehabilitation, the final decision regarding their acceptance being made by the local agency. Mental retardation, mental illness, speech and hearing disorders, heart disability, and amputations are included in the handicaps dealt with.

The 1965 Amendments established medical examinations to determine the degree of disability and other services to estimate ultimate employment capacity as a regular part of vocational rehabilitation. Special workshops to train the handicapped are authorized, with the federal government paying 90 percent of the costs. Weekly training allowances up to $25 plus $10 for each dependent (maximum $65 per week) are authorized for two years.

The program is administered by the Vocational Rehabilitation Administration of the Department of Health, Education, and Welfare. State rehabilitation agencies may apply for regular funds.

HEALTH CARE FOR DISADVANTAGED YOUTH: SOCIAL SECURITY AMENDMENTS OF 1965

The employability of many jobless youth is seriously impaired by defects of health. A comprehensive youth-work program needs to include health care providing physical examinations and medical care. The Social Security Amendments of 1965 includes two programs which may provide such services. Their full potential remains to be developed.

Special Project Grants for Health of School and Preschool Children (Title II — Part 1 — Sec. 532):

The Children's Bureau, Welfare Administration of HEW is authorized to make grants to projects that promote the health of children and youth of school and preschool age, especially in areas of concentrations of low income families. These grants can be made to state health agencies, to other health agencies in the state (with the approval of the state health agency), and to any medical and dental school. These eligible agencies can make applica-

16 **The Budget of the United States Government 1967**, p. 119 and 248.

tion for grants to the Division of Health Services of the Children's Bureau, HEW. The federal grant can cover 75 percent of the costs of a comprehensive project for health care and services for children and youth of school age. Since the covered youth need not be enrolled in school, it may cover school dropouts and potential dropouts enrolled in youth-work programs.

The law stipulates that approved projects must include screening, diagnosis, preventive services, treatment, correction of defects and aftercare, both medical and dental, as the Secretary of HEW prescribes. Only low income family children are to receive treatment, correction of defects and aftercare. Appropriations are authorized for these projects of $15 million in fiscal 1966, $35 million in fiscal 1967, and $45 million in fiscal 1968.

Grants to States for Medical Assistance Programs — (Title XIX)

Under plans developed and administered by state welfare agencies, and approved by the Secretary of HEW, federal funds will be made available to cover 60 percent of the cost for medical assistance for needy individuals including low income families with dependent children lacking resources "to meet the costs of necessary medical services . . ." This medical assistance can be given to needy persons not receiving other public assistance, and is aimed to cover all needy children under 21 years of age.

"Medical assistance" is defined to include, among other care, dental services, eyeglasses, clinic services, and "other diagnostic, screening, preventive, and rehabilitative services".

Application for Title XIX funds must be made by the state welfare agency to the Bureau of Family Services, Welfare Administration, HEW. Title XIX became effective January 1, 1966.

The House Ways and Means Committee report on the Social Security Amendments of 1965 estimated that "if all States took full advantage of provisions of the proposed Title XIX, the additional Federal participation would amount to $238 million. However, because all States cannot be expected to act immediately to establish programs under the new title . . . the Department of Health, Education, and Welfare estimates that additional Federal costs in the first year of operation will not exceed $200 million".[17]

ELEMENTARY AND SECONDARY EDUCATION ACT OF 1965

Deficiencies in ability to read and write English and to handle simple arithmetic seriously limit the employability of a large part of disadvantaged

17 U. S. Congress, House of Representatives, Committee on Ways and Means, **Social Security Amendments of 1965,** Report No. 213, March 29, 1965, pp. 74-75.

jobless youth. A great new potential resource for the remedial education necessary to deal with this problem is found in the Elementary and Secondary Education Act of 1965 (ESEA).

The main body of the Act is Title I — "Financial Assistance to Local Educational Agencies for the Education of Children of Low Income Families". For the purposes of Title I, $970 million is budgeted for fiscal 1967 — about 80 percent of the total appropriations for the Act. The purpose of this federal aid is to help local school districts meet "the special needs of educationally deprived children". It is recognized that where such low income families are concentrated there is also low community capacity to meet special educational needs.

Under this law the U. S. Commissioner of Education makes grants to local school districts based on a formula determined in large part by the number of children aged 5 to 17 inclusive who come from families with annual incomes of less than $2,000.[18] But the Act does not limit aid to children of 5 to 17, defining the term "child" as meaning "any child who is within the age limits for which the applicable State provides free public education".

The federal grants are to be used for programs and projects "to meet the special educational needs of educationally deprived children . . ." The House Labor Committee in reporting this legislation emphasized that "to the maximum extent possible, this legislation gives encouragement to local school districts to employ imaginative thinking and new approaches to meet the educational needs of poor children". The Committee listed a large number of suggested programs as "illustrative of the many possible uses of funds". Included were the following items of special interest to youth-work programmers: Remedial programs, especially in reading and mathematics; programs for the early identification and prevention of dropouts; work-experience programs; on-the-job training for high school students; supplemental health services; institutes and in-service training of teachers in special skills; increased guidance service. The Committee emphasized that the list was "not intended in any way to limit the possible uses of funds by the local school district . . ."[19]

It would appear that such wide latitude for use of this aid to education funds permits projects for high school drop-outs, particularly with remedial education for those participating in NYC or other work-training programs.

18 "Legislation will be recommended . . . to raise the low income criterion for special assistance from $2,000 to $3,000 for fiscal year 1968", **The President's 1967 Budget Message**, p. 131.

19 U. S. Congress, House of Representatives, Committee on Education and Labor, **Elementary and Secondary Education Act of 1965**, Report No. 143, March 8, 1965, p. 6-7.

This potential relationship to the development of a comprehensive program is also indicated by the Act's requirement that to receive a grant under Title I, "wherever there is . . . a [OEA] Community Action Program, the programs and projects [must] have been developed in cooperation with the public or private non-profit agency responsible for the Community Action Program . . ."

The federal government pays all the costs for programs set up under the ESEA. Its administration is in the U. S. Office of Education of the Department of Health, Education, and Welfare. Local school agencies apply to the U. S. Commissioner of Education for Title I funds through the state education agency whose approval is required.

A further section of the Elementary and Secondary Education Act of interest to youth-work programs is in Title III — "Supplementary Educational Centers and Services". One hundred million dollars was authorized for this title in fiscal 1966. These funds are to go to local school districts for special projects of supplementary educational services and activities such as "Comprehensive guidance and counseling, remedial instruction and school health . . . services designed to enable and encourage persons to enter, remain in, or reenter educational programs, including the provision of special educational programs and study areas during periods when schools are not regularly in session".

In regard to Title III, as with Title I, the House Education and Labor Committee stressed the legislative purpose in ESEA to permit wide latitude in the funded programs. The Committee report stated that "In this Title the Committee has made use of the language 'centers and services' in order to provide local public educational agencies with the greatest flexibility possible within which to exercise local discretion and judgment with respect to the types of projects which will best serve the educational needs of the community".[20]

Title III funds are processed in the same manner as Title I funds, by local public educational agency application to the U. S. Commissioner of Education transmitted with the approval of, and by, the state education agency.

CIVIL RIGHTS ACT OF 1964

In the Civil Rights Act approved by Congress on July 2, 1964 there are two sections relevant to the problems of the employment of disadvantaged youth. These are Title VI — NonDiscrimination in Federally Assisted Programs and Title VII — Equal Employment Opportunity.

20 U. S. Congress, House of Representatives, Committee on Education and Labor, Report No. 143, op. cit., p. 17.

Title VI — NonDiscrimination in Federally Assisted Programs

The sweeping injunction of this section directs that there shall be no discrimination against any person on the grounds of "race, color, or national origin" in any "program or activity receiving Federal financial assistance". Such assistance means grants, loans, or contracts. Compliance is to be enforced by the federal government through "termination or refusal to grant or to continue assistance . . ."

Title VII — Equal Employment Opportunity

This title of the 1964 Civil Rights Act makes it unlawful for an employer, because of "race, color, religion, sex, or national origin . . . to fail or refuse to hire or to discharge any individual or otherwise to discriminate against any individual with respect to his compensation, terms, conditions, or privileges of employment". It further outlaws such discrimination "to limit, segregate, or classify . . . employees in any way which would deprive or tend to deprive any individual of employment opportunities". A similar mandate is directed to employment agencies and labor organizations.

By "employer" is meant anyone, or the agent of anyone, engaged in "an industry affecting commerce". During the first year of the law's effectiveness (until July 1966) the law applies to employers with one hundred or more employees; for the next year it also applies to those with 75 workers; from July 1967 until July 1968 the application limit is employers with at least 50 workers. After July 1968 all employers with 25 or more employees are covered by the law. It is estimated that this means 29 million workers hired by 259,000 employers will be covered.

An Equal Employment Opportunity Commission of five members is created to effectuate the law. Regional or state offices of the Commission are authorized. Charges of violation of Title VII may be made either by the aggrieved worker or by a member of the Commission. Investigative and enforcement procedures by the Commission, the Attorney General, and the federal courts are provided.[21]

21 On April 27, 1966, by a vote of 299 to 94, the House of Representatives passed HR 10065, the Equal Opportunity Act of 1966, which aims to strengthen the 1964 legislation. Congressman John Dent (D-Penna.), Chairman of the House Education and Labor Subcommittee handling this bill told Congress, "Three major weaknesses exist in the present law. It is limited in coverage to only 8 percent of the employers in the United States. It is devoid of the typical administrative enforcement provisions. it is inadequate in its treatment of apprenticeship and training programs". To meet these defects, HR 10065 would apply the law to employers of 8 or more workers after July 2, 1967 (adding about 10 million workers to the law's coverage); would give the Equal Employment Opportunity Commission more direct powers of enforcement; and would require a continuing survey of minority participation in apprenticeship and on-the-job training programs. See **Congressional Record,** April 27, 1966, pp. 8691-8726.

Juvenile Delinquency and Youth Offenses Control Act:

This pioneer legislation authorizes the Secretary of Health, Education, and Welfare to fund projects to develop and evaluate new techniques and programs for the reduction of juvenile delinquency.[22]

The target population of this legislation comprises both actual and potential delinquents, "school dropouts, unemployed youth faced with limited opportunities and with employment barriers, and youth in deprived family situations".

Since enactment of this law in September 22, 1961, the Office of Juvenile Delinquency and Youth Development in HEW has developed demonstration projects which have emphasized youth-employment programs and the coordinated enlistment of all segments of a community as effective means of combatting juvenile delinquency. These presaged the youth-work and Community Action Programs of the Economic Opportunity Act which have begun to assume responsibility for the continued operation of some of the original demonstration projects initiated under the Juvenile Delinquency Act. Also under this law, special projects for training personnel to be used in delinquency control efforts, for the preparation of training and curriculum materials, and for provision of technical assistance have been developed and funded. A special demonstration project in Washington, D. C. was set up in 1964.

The Juvenile Delinquency Act in 1965 was extended to June 30, 1967 and $6.5 million dollars was authorized for fiscal 1966. For fiscal 1967, $10 million was authorized. The President's budget for fiscal 1967 requests new obligational authority of $8,207,000 to "initiate 13 new demonstration projects, continue to support the special project for the Washington metropolitan area, and 15 existing projects, and train 10,000 individuals (2,000 more than in 1966) who will work to prevent or control juvenile delinquency".[23]

22 According to Bernard Russell, Director, Office of Juvenile Delinquency and Youth Development, Welfare Administration, Department of Health, Education, and Welfare, "There are rough estimates that there are 1.2 million or more delinquent children arrested every year. There are further estimates . . . that there are at least an equal number or more who were never actually adjudicated delinquents, but who indulged in some delinquent behavior". U. S. Congress, **Departments of Labor and Health, Education, and Welfare Appropriations for 1966,** Hearings before a Subcommittee of the Committee on Appropriations, House of Representatives, Feb. 3, 1965, p. 1156. The estimated annual cost to society of juvenile delinquency is estimated "as high as $2.6 billion". U. S. Congress, House of Representatives, Committee on Education and Labor, Report No. 1139.

23 **The Budget of the United States Government, Fiscal Year Ending June 30, 1967,** U. S. Government Printing Office, 1966, p. 260.

Important Related Legislation

Public Works and Economic Development Act of 1965.

Appalachia Regional Development Act of 1965.

Housing and Urban Development Act of 1965.

These laws are not directly related to the employment problems of disadvantaged youth. But they have a very real potential relevance. Addressed to special areas of economic development and need for assistance, this legislation opens up special opportunities for coordinated relationship between the programs it establishes and manpower programs seeking employability and employment of youth. For the most part, these possibilities remain to be explored and developed.

Public Works and Economic Development Act of 1965

This law provides $760 million dollars annually in financial grants, loans, and technical assistance to communities and regions of excessive unemployment to aid in the creation of new jobs. "Redevelopment areas" eligible for assistance are defined as those where the jobless rate is "substantially above the national rate", where average family income is low, or where other special "depressed area" characteristics predominate. The Secretary of Commerce is responsible for effectuating the Act. A system of federal-state Regional Action Planning Commissions is created to administer the program under the coordination of the Secretary.

The grants for public works and development facilities are directed to projects which will, besides aiding the economy of the area generally, "primarily benefit the long-term unemployed and members of low income families or otherwise substantially further the objectives of the Economic Opportunity Act of 1964". The Secretary of Commerce is authorized to consult with other persons and agencies "who can assist in meeting the problems of area and regional unemployment or underemployment".

Appalachian Regional Development Act of 1965

This law establishes a unique joint federal-state program for economic development in the Appalachian area from Alabama to New York. The Act authorized a $1.1 billion six-year program. Congress appropriated $350 million for fiscal 1965 and 1966. The main component of the program is for highway construction, with federal funds of $840 million to cover about 70 percent of a $1.2 billion construction program over six years. Regional health centers are provided, with $41 million authorized to cover 80 percent of the construction costs. The federal government is authorized to spend

$28 million for the operation of these centers, 100 percent of the total costs for the first two years and 50 percent for the next three years. Sixteen million dollars is authorized for the construction of vocational educational facilities.

The Appalachian region as defined in the law includes all of West Virginia and portions of eleven other states: Pennsylvania, New York, Maryland, Ohio, Virginia, Kentucky, North Carolina, South Carolina, Georgia, and Alabama. Seventeen million people live in the area. The Governor of each state involved is a member of the Appalachian Regional Commission, while State Regional Representatives designated by each Governor conduct the regular business of the program.

The Senate report on this legislation stated, "Though the Committee acknowledges that the primary purpose of this bill is resources development and not the creation of immediate employment opportunities, we would urge the Secretary of Commerce, implementing the highway and other construction programs, to promulgate regulations which will assure the maximum feasible employment of local labor".[24]

Housing and Urban Development Act of 1965

A wide variety of federal assistance is established in this law to assist in providing housing for low and moderate income families, to aid in urban redevelopment, and to improve living conditions and community facilities. In general it is required that all labor hired by contractors and sub-contractors under this program must be "paid wages at rates not less than those prevailing on similar construction in the locality as determined by the Secretary of Labor in accordance with the Davis-Bacon Act".

Section 703 and 708 authorizes $50 million a year for neighborhood facilities that are "necessary for carrying out a program of health, recreational, social, or similar community service" (including a Community Action Program approved under Title II of the Economic Opportunity Act of 1964). Such a facility should be "consistent with comprehensive planning for the development of the community" and available for use by a large part of the area's low or moderate income population. It is specifically required in Section 703 (e) that "The Administrator shall give priority to applications for projects designed primarily to benefit members of low-income families or otherwise substantially further the objectives of a community action program approved under Title II of the Economic Opportunity Act of 1964".

24 U. S. Congress, Senate Committee on Public Works, Report No. 1383, August 13, 1964, p. 10.

CONCLUSION

The legislative base — at least in outline — for a comprehensive youth-work program has been created. It is true there are gaps and inadequacies, particularly in available funds. Much of the law is vague and will require time and experience in application to gain precise meaning. There are serious difficulties and complications in putting some of the legislative intent into practice. Above all, there is the lack of integrated coordination and direction which unfortunately characterizes all federal manpower policy and practice.

But there is much legislation to be utilized by the enterprising official shaping a program to increase employability and employment for disadvantaged youth. The experience of applying these laws will not only serve the youth-work program, but will doubtless develop the most constructive basis for legislative amendments and additions in the future.*

*INTERSTATE CONFERENCE ON LABOR STATISTICS, STORRS, CONNECTICUT, JUNE 15-18, 1965

The major focus of the Conference was on the statistics needed for effective government and local community cooperation in programs to meet the needs of disadvantaged groups. Ten speakers presented papers and each was discussed by selected panel members or other conference participants. The topics were: (1) "Provisions for Job Opportunities and Employability in Manpower Legislation" by Louis Levine, (2) "Government and Community Participation in the Program of Economic Opportunity," by Hyman H. Bookbinder, (3) "Yardsticks for Counting the Poor," by John G. Myers, (4) "Community and Government Cooperation for Disadvantaged Groups," by Raymond F. Male, (5) "Current Economic Situation and Outlook," by David Pinsky, (6) "Developments in State and Federal Statistics and Research Roundtable," by Carl Cabe, (7) "Productivity and Automation," by a panel of five, (8) "Statistics for Industry and Government Safety Programs," by Robert H. Ferguson, (9) "Manpower Information Needed for the Planning of Training and Education Programs," by Robert E. Johnson, and (10) "The Last Five Years: Economic Expansion and Persisting Unemployment," by Ewan Clague and Robert A. Gordon. Delegates included state and federal government administrators, economists, and statisticians, as well as representatives of universities, labor, and business organizations. (ET)

INTRODUCTION

The 23rd Interstate Conference on Labor Statistics was held June 15-18, 1965, on the campus of the University, Storrs, Connecticut. The Connecticut Labor Department and the University of Connecticut served as cosponsors with the Bureau of Labor Statistics of the U.S. Department of Labor. The conference was attended by representatives of 38 States and Canadian Provinces. Delegates included State department of labor administrators, economists and statisticians, representatives of universities, State bureaus of economic security, State workmen's compensation agencies, and officials of labor and business organizations. Department of Labor AID trainees from Algeria, Ethiopia, Indonesia, Iraq, Liberia, Pakistan, Panama, South Viet-Nam, Thailand, and United Arab Republic were among the delegates.

The major emphasis in this year's program was the statistics needed in community and government cooperation for disadvantaged groups--how State and Federal statistics and research are used in community action programs. One of the highlights was the session on Yardsticks for Counting the Poor, a discussion by governmental and university experts of the level of income to be considered as a base for identifying the number of persons with inadequate incomes. A session considered applications of Federal and State research statistics in the administration of poverty programs. The discussion included the research needs of the OEO and Appalachia programs. There was much interest and audience participation in the symposium on the current economic situation and outlook. The annual roundtable of developments in State and Federal statistics and research included papers on the program of economic indicators, regional business cycles, and interpreting economic statistics, implications of automation and impacts on employment, labor education programs in universities, and a special analysis of New England collective bargaining agreements. Another highlight was the session on manpower information needed for planning training and education programs. The discussion included U.S. and Canadian experiences and State programs.

Dr. Robert A. Gordon of California presented a most stimulating paper in the final session. He analyzed the economic expansion and persisting unemployment over the last 5 years. After several days of intensive consideration of specific developments and uses of labor statistics, the delegates felt that this excellent analytical treatise on the economic health of the nation was an ideal subject on which to conclude the conference.

These proceedings provide a ready reference for those who attended the conference and will be of interest to others working in the field.

Walter G. Keim, Executive Director
Interstate Conference on Labor
Statistics

ADDRESS OF WELCOME

Renato E. Ricciuti, Commissioner
Connecticut Labor Department

I am very pleased and happy to welcome you to the State of Connecticut this morning. I think all of us owe thanks to the people who have arranged this program. It is a very interesting program, and we are going to get started very quickly.

If there is anything that the Labor Department, or the people here representing the Labor Department in Connecticut, can do to make your stay more enjoyable please do not hesitate to call on us.

To give some greetings to you from the University and for some comments on the program, I would like to introduce to you John J. Glynn who is the Director of the Labor Education Center of the University of Connecticut.

John J. Glynn, Director
Labor Education Center
University of Connecticut

I would like to extend a hearty welcome to all of you on behalf of the administration of the University, on behalf of the faculty of the University, and more particularly on behalf of the staff of our Labor Education Center which is part of the Division of Continuing Education Services here at the University.

President Homer Babbidge regrets that he could not be with you this morning to extend these greetings himself, but a previous commitment in Syracuse keeps him away today.

We are happy for several reasons that you have decided to meet here at the University of Connecticut, through the services of our Connecticut Labor Department. For many years the University has been fortunate in obtaining professional assistance, in giving courses and lectures, from many officials of our State Labor Department, none the least of whom is our good friend, the Commissioner, who was an early lecturer in programs in industrial relations, labor relations, and other problems of the State in our Extension program. Other officials of the Bureau of Labor Statistics have regularly lectured in programs offered by the University, and we feel that there has been a contined, warm, and constructive relationship between the State University and the State Department of Labor.

The administration has been working to expand and extend the academic strengths of the University, both in our undergraduate program, in our graduate program, and in our Extension services that are available to all citizens in this State.

We are proud of this growth, and we hope that you sense some part of it in your stay here.

Members of our faculty are sitting in and will be sitting in on your meetings. One that is possibly known to many of you was to take part in the program, but a last-minute decision in Washington sent him to the Far East where he has been consulting with the government in Lebanon. I am referring to Dr. Philip Taylor who would like very much to have been here during this conference and taken part in it and picked up some old friendships with several of you.

Incidentally, you are here in Connecticut and opening your conference on a rather historic day for this State. We are balloting up and down the State today for delegates to a State Constitutional Convention which will convene in July, and at that time--for the third time I believe in Connecticut history --representative delegates from both parties are going to take a real look at our State Constitution, are going to amend it in such a way as to make re-apportionment legal and constitutional, and otherwise strengthen, we hope, and update our State Constitution. So today many of us will be going to the polls, not as many as we would like because there are no contests, but that is another story. At least, things are happening and happening rapidly in Connecticut in the political field as well as in the field of labor statistics, industrial relations, and economic growth.

This has been a venture as far as we are concerned in three-way planning, and we were very happy to be accorded the privilege and the opportunity to work with Walter Keim and his staff in Washington at the same time that we were able to work with the Commissioner's staff in Hartford and particularly with David Pinsky and the people in his Department. We will do the best, from the point of view of the University, to go along with the Commissioner's suggestion of doing everything that we can to make your stay an interesting, stimulating one and a memorable one.

MR. RICCIUTI: I am sure most of you know the next speaker very well, and I will not presume to give a long introduction. It is too bad that Ray Male does not get here until this afternoon because I am sure he would have relished introducing Mr. Clague himself.

Ewan Clague, Commissioner
Bureau of Labor Statistics
U. S. Department of Labor

Mr. Glynn's opening address reminds me that I first got into statistics on the general subject which Connecticut is voting on here today. I was a young student of political science out at the University of Washington in Seattle. We had not had a redistricting of our State in the previous thirty years, so a Professor of Political Science suggested that I might take up that subject and find out what the general pattern among the States was.

It happened that a war broke out at that time and I joined the Army, but I had about two or three months at the University campus before I was actually called away. So, apart from drill, I was comparatively free for the next two months.

I wrote to each of the State governments and collected information on the districting of their legislatures. Then I assembled the population statistics by counties from the latest census. So I plunged into statistics without ever having had a course in the subject. I worked up the balance of representation in nearly every State in the Union. I turned that in for my term paper in political science. That is how I received my start in statistics.

I recall a more recent example of the importance of statistics in the modern world. In September, 1946, there was a world conference of statisticians in Washington, D. C. At this conference of statisticians, with delegates coming from all over the world, there was a good deal of concern about conditions not only in the U.S. but throughout the world. There was a newspaper somewhere in this country--I never found the original--in which there appeared an editorial about as follows: "Look, this is the gang which supports government controls; they are the backers of rationing; and they are the fomenters of Communism; this would be a very good place to use the remaining atomic bombs to blow up the whole batch of them."

There was another editor who took a different view. He commented on the first one by saying, "Don't shoot the statistician; he is your friend; he makes it possible for the free enterprise system to work." I got hold of that editorial; it is in my files for my memoirs.

Last Monday morning I received a call from an economist of a business concern in New York, who said, "When are those employment figures coming out--the employment, hours, and earning statistics; we're going to have a board meeting tomorrow, and I would like to get the figures; we're going to put them on charts to show them to our board." So I said, "Well, the press conference is at 2:00 o'clock this afternoon; my staff will be alerted; if you will call such-and-such a number at 2:00 o'clock they will give you the figures for your meeting."

That is an illustration of the importance that is now attached to these figures of employment and unemployment. Of course, we are still getting some of the criticisms that we have always had for the last four years, such as the following: "You shouldn't be counting the teenagers as unemployed because they're all babysitters anyhow, and it doesn't matter whether thev sit or not.

On the positive side, I might point out to you that the entire youth program now in operation in the Federal Government (and in the States and localities) is the direct result of our statistics on the unemployment rates. These rates have clearly demonstrated where the problem of unemployment lies.

There is another field (prices) in which we have received many criticisms: "Your indexes are all too high; the cost of living is actually declining; you have failed to allow enough for quality improvement. At the same time we get a lot of letters from women shoppers, who claim that the prices we get are much too low; that they do not find the prices that we seem to be quoting.

There are three separate investigations of price indexes underway. I must remind you that there are still millions of workers whose wages are escalated by the Consumer Price Index. I reminded you last year that all Federal retirement annuities are escalated by the Index. All military pensions are escalated by the same index. We in the Federal Government, at least, are protected against inflation when we retire, as long as this law operates and as long as our index is produced.

Last Thursday I appeared before the House Post Office and Civil Service Committee to explain our statistics on wages and salaries in private industry. By a law of the Federal Government these wages and salaries in private industry determine the salaries of Federal employees, and Congress is now considering a raise in Federal salaries based upon our findings.

That is one statistic that nearly everybody loves. I had a wonderful time, and my heart was warm with the fine appreciation that the Congressmen expressed for our figures.

When I testified, we got into a discussion of State and local government employment. There is some question about State and local government salaries. Some of the people in Washington want us to survey State and local government salaries on the ground that they, too, should be taken into account by us "Federals," when we fix our salary scale.

On the other hand, there is another school of thinkers who say, "State and local salaries are so low that they should not be used for the comparison; in no case should they be collected or averaged." I do not know how that contest is coming out.

The Council of Economic Advisors has worked in the last annual average of output per man-hour for private industry and is using the trend as a guide post for settlements of wages and salaries. That, too, means a lot of debate and discussion concerning our statistics of productivity: Are they accurate; could we make them better; did we take into account all the factors?

Then there is the Automation Commission, which has been set up by the Congress and the Administration, which is reviewing the whole subject of automation and its effect upon our economy: Is it a promise or a menace? On the one hand, we have some people talking about the 4-hour day and the 4-day week while others are arguing that we are losing out to Communist countries in the expansion of our production.

Even in the field of work accidents, with which you people are especially familiar, a new debate is breaking out. There is a debate about whether traffic accident statistics are worthy of the name, and whether something should be

done to produce better traffic safety. This is leading to a discussion of automobile excise taxes and whether or not certain safety devices should be standard equipment on cars.

In our Bureau and in your work, you are immune from that particular statistic, but you and we are directly involved in the statistics of industrial accidents which are under discussion, both in the Federal Government and in industry itself.

Finally, in the international field, we have a Division of Foreign Labor Conditions, which we call upon to make a good many comparisons of international statistics. We are continually on the spot in comparing our statistics of unemployment with those in other countries, the question being raised as to whether ours are not too high, because we gather them in a different way; whether we should readjust theirs upward or ours downward to make them more comparable. We are getting continual questions from Congress about wages in foreign countries and what effect they have on international trade.

There is much discussion about prices: Are we pricing ourselves out of world markets? We had requested a small appropriation this year to start an index of international prices in order to compare prices in the United States with those of other countries. But, we did not get that money.

In the field of productivity, there are arguments as to whether our workers are as productive as they should be compared to foreign standards, whether high productivity in this country is sufficient to balance the high wages that we have.

In all these fields, statistics are at the forefront of discussion, including statistics of other agencies, such as the Census, the Bureau of Employment Security, the Bureau of Mines, the Department of Agriculture, and so on, which I shall not take time to discuss.

John Maynard Keynes, the great economist, commented in writing almost thirty years ago about as follows: "You must not overlook the great influence of economists; whenever you find some ambitious politician coming out with some new idea which he is plugging very strongly and stirring up the populace, you will usually find somewhere in the background an obscure economic scribbler who thought up the idea."

What Keynes was pointing out it that economic theory is very important.

I would like to point out that the possibilities now are that when a politician is advancing some spectacular program, there is some anonymous statistician with a computer who is feeding him a statistic.

So I welcome you to this conference on statistics, a conference of statisticians.

ORGANIZATION OF THE CONFERENCE

Walter G. Keim, Executive Director
Interstate Conference on Labor Statistics

I certainly underscore everything that Mr. Clague said and that Commissioner Ricciuti, David Pinsky, John Glynn, and the other fine folks for this cordial welcome to Connecticut.

It is quite pleasant to look out over the group this morning and to see so many delegates from the West and the Midwest, the South, Harold Roberts here from Hawaii, Mr. Nazario of Puerto Rico, and to greet, for the first time, you new members from Connecticut and the East.

I am especially pleased this morning to see the large representation from New York and Pennsylvania. They always make a fine contribution to our Conference.

As in other years, all the States and Provinces were invited, and more than 40 are represented here. The attendance includes officials from State Departments of Labor, Federal agencies, Workmen's Compensation Boards, Bureaus of Employment Security, municipalities, State Education Departments, universities and labor, and industry organizations and business concerns.

We are very pleased with the representation of universities at this Conference. About 25 are represented here, which is a fine turnout.

To the many delegates who are with us today for the first time, we try to arrange the program to cover a cross section of interest of our membership, which represents a wide variety of subjects. We want to provide interest and stimulation to the many types of users of labor statistics, educators, research economists, and statisticians. The Conference is, in effect, a professional society of producers and users of labor statistics. The steering committee each year considers the suggestions that you send in, you are very prolific with ideas, and we certainly thank you for your interest, and the significance of certain types of data relative to the current economic situation.

The committee this year included David Pinsky, Charles Pearce, Maurice Gershenson, Harry Stark, Esther Espenshade, and Wendell Macdonald.

When there are new developments in Washington and in the States and Provinces, in major economic series, research programs, or statistical techniques, we consider them for our agenda. We want our Conference to serve as a medium for communication and for the exchange of experiences in the preparation and uses of the data.

As most of you know, we always have on hand 4 to 6 invitations for the Conference site, and it isn't any easy matter to make the selection each year. Our principle is to move around to different regions, California to Florida, and then North, and perhaps next year the Midwest or to Puerto Rico.

The oldtimers in these conferences have fond memories of other meetings held in New England at York Harbor, Maine; Newport, Rhode Island; Amherst, Massachusetts; and here in Hartford in 1952. Now, after 13 years, we return to Connecticut.

The Connecticut Labor Department has one of the very best programs in the country. They know how to produce labor statistics and use them effectively in the administration of their broad legislative program. Moreover, as you will observe as we move along through these sessions, the Connecticut Labor Department is one of the principal agencies--if not the foremost one--in the preparation and dissemination of economic information for the State.

As you will see, statistics are treated as important tools for planning economic policy, measuring the economic health of the State, and for administrative purposes.

The Commissioner and Mr. Pinsky and members of the staff will be available throughout the Conference for consultation. In addition, they will welcome your visit to an open house which will be held Friday afternoon at the sparkling, new Department of Labor Building.

The program opens on a high note this morning with our two keynoters, Hyman Bookbinder, Assistant Director of the Office of Economic Opportunity, and Louis Levine, Director of the United States Employment Service, setting the stage for the principal programs to follow. Mr. Levine is a basic part of the Conference family, along with Mr. Clague and Mr. McElroy. Louie is traditional here and an invaluable contributor to our program each year.

Similarly, we are grateful to Mr. Bookbinder for taking the time from an extremely busy schedule as Mr. Shriver's assistant to join us here this morning.

This afternoon, we present a definite first in the session on "Yardsticks for Counting the Poor," the first time experts will appear in public forum to discuss differing views on how to count the poor.

Also this afternoon, a panel discussion on "Community and Government Cooperation for Disadvantaged Groups," applications of Federal and State research and statistics in the administration of the poverty programs.

Mr. Male, Commissioner of the New Jersey Department of Labor and Industry will share this program. I don't think we can hold a conference without this gentleman. He is a staunch friend and supporter of all of our meetings and a man dedicated to helping youth and the underprivileged.

To bring my little statement to a close, I want to remind you of Assistant Secretary Moynihan's remarks at the Miami Conference. Economic statisticians have played a strategic role in stimulating decisions and molding public policy; particularly since the 1930's. Those involved in the statistics of labor and income, many of you here today, have applied a wealth of imagination to the development of rich detail and ingenious techniques that provided information

on unemployment for example by age, sex, skills, and duration. By such efforts, manpower policy has been vitally influenced. We are now aware, because of these data, of the scope of youth education and employment problems. At the same time, we know that we need further information about them and about other employment and manpower questions. Only people like you can supplement these achievements. Think now about how we can defeat poverty and measure its defeat, or positively how we can assess the American level of living. Your statistical sophistication is adequate for this task. It has kept up with the cybernation age. The principal lack is new thought about what can and must be fed into the data processing machines, appreciation of the interdependence of social and economic factors, and awareness that people and the economy do not live by bread alone.

This is a challenge to all of us to make our statistics work in really productive ways. We are providing much useful data and consultation to labor, industry, and the public generally in such fields as safety, industrial peace, productivity, cost of living, prices, manpower employment, wages, and labor turnover. We have a wealth of data at national and local levels, but we can do much more in working with local groups on socio-economic matters than we now do. We can bring to bear much local data on occupational skills to be fostered, reasonable rates of pay, appropriate job-counseling information, and the criteria to be used in assessing community needs in terms of youth unemployment.

You can help communities direct their young people into the most effective programs particularly those among the most needy groups. Your data and advice about ways to use them will be invaluable to the community action phase of the President's program. If we want to be of the greatest aid, we must be flexible and adaptable in our application of data to specific purposes.

Yes, this effort will require the best we have to offer with a flair for innovation and creativity.

Mr. Chairman, thank you for inviting us to Connecticut.

MR. RICCIUTI: You know, when Mr. Martin was talking about the similarities between our present prosperity and the fabulous Twenties, he said in part that most governmental officials were comforted that a new economic era had opened, an era in which business fluctuations had become a thing of the past, in which poverty was about to be abolished.

A contrary view to Mr. Martin's has been presented by the President's Council of Economic Advisors in a recent report. This report, in commenting on the fact that the present economic expansion has lasted 51 months from early 1961, said:

> It is premature to say business cycles have been eliminated, but we now know there is no necessary reason why an expansion must end in 36 months, in 50 months, in 80 months, or any other arbitrary length of time. Prosperity is determined not by the record of employment, but by the actions of business, labor, and government. So long as these actions remain responsible and constructive, prosperity will endure.

I have long felt that the Employment Service should be the mainspring in the fight for full employment. Connecticut has opened recently a new apprenticeship information center in Bridgeport, and just last week a Youth Opportunity Center in Hartford. I know that our speaker feels much the same way about the Employment Service.

Formerly Director of the Division of Research of the Bureau of Employment Security in Washington, a graduate of Ohio State University, a Doctor of Economics, the present Director of the United States Employment Service and the Bureau of Employment Security in the United States Department of Labor, it is a pleasure to present to you Mr. Louis Levine.

PROVISIONS FOR JOB OPPORTUNITIES AND EMPLOYABILITY IN MANPOWER LEGISLATION

Louis Levine, Director
United States Employment Service
Bureau of Employment Security
U. S. Department of Labor

Thank you Commissioner Ricciuti, Commissioner Clague, Walter Keim--who never fails, or seems never to fail, to invite me to be with this group. It is a distinct pleasure for me to come here to see these people whom I have come to know well over the years and come to respect for the major contributions they make to economic development and the formulation of policy and legislation in the field of human resources.

This meeting in 1965 at the mid-point of the decade of the Sixties should provide an excellent occasion to take stock of what has been happening in the field of manpower and human resources, and of what might lie ahead. Just before the beginning of this decade people were forecasting what this decade would be like. We have now reached the half-way point. What do we find? Well, for one thing, I think all of us would agree that perhaps never in the entire history of the United States--even including the depression of the Thirties with its New Deal legislation--has there been such a concentration of manpower legislation and programs in such a brief period of time. This emphasis is especially significant since we are not endangered by a major depression nor does it seem likely that we will have one.

Already people are coming to refer to this as the period of the "Manpower Revolution." I will not burden you with recounting all of the manpower legislation which has found its way to the statute books since early 1961. Here are a few of the highlights: The Area Redevelopment Act, with the manpower training provisions now transferred to the Manpower Development and Training Act; the amendments to the Social Security Act for the rehabilitation of public welfare recipients; the Manpower Development and Training Act, which in its brief history has already been significantly amended twice (the last amendments were only a few weeks ago); the overhaul of vocational education undertaken for the first time since 1917 in the United States; the Civil Rights Act of 1964,

which I count as a very important part of manpower legislation and the manpower revolution; the Economic Opportunity Act of 1964; and the Elementary and Secondary Education Act of 1965. One can just go on citing one piece of legislation after another, dealing with education, training, retraining, and occupational rehabilitation of the human resources of the United States.

This legislation did not come about by chance. The labor statisticians of the United States made a major contribution in providing the basis for this legislation. There can be no doubt that during the last decade the United States developed an awareness and a sensitivity to the importance of manpower resources. There have been some important developments in manpower legislation within the last 4 years that I would like to call to your attention. I think they are significant to all of us concerned with the collection of data bearing on manpower problems. You may well remember that the earliest manpower legislation, in the first part of the Sixties, came at the tail-end of the recession of 1960-61. Much of the justification for that manpower legislation was on the basis that it was an anti-recessionary measure.

That was only 3 or 4 years ago. We have already forgotten this because the philosophy and the rationale for the justification of manpower legislation has moved far beyond that of anti-recessionary measures. Now manpower legislation is recognized as a response to developments that have been taking place in this country between the end of World War II and the end of the decade of the Fifties. You know better than I the experience with respect to unemployment rates, the duration of unemployment, and postwar recessions.

The growth of significant manpower problems in terms of the youth of this Nation and particularly the relationship of education to employment is important. We are aware of the truly unfortunate, tragic experience of those people in the Fifties. Through the entire postwar period, as we look back now, we find that the social and economic institutions which were most firmly established, which were among those most respected in the United States, were frequently the institutions most distantly removed from some of the more important manpower problems that were emerging. I do not exclude the Employment Service, it belongs together with those other institutions such as the schools, high schools, colleges, and our vocational educational facilities. We were concerning ourselves in the Fifties with how we could keep abreast of an avalanche of human resources hitting the elementary schools, subsequently the high schools, and now the colleges. The problem seemed to be sheer numbers, how to mobilize resources for school teachers and school plants and equipment.

With the launching of Sputnik, there was a great awareness of the importance of educated human resources. Our concern was for talent in science and in engineering. You may well remember that in the mid-fifties the concentration of the educational institutions in this country was on seeking out the gifted and talented youth. It was not enough to deal with the middle class or the average youngster. We were even going to put them aside to search out the talented and gifted youth; thus,we were far removed from the disadvantaged youth. We were far removed from those sectors of our population which we pretended did not exist. Yet they were becoming increasingly evident

in the statistics of crime and juvenile delinquency. The problems of the masses in the slums of our larger areas could not be ignored. There are problems equally serious perhaps in our rural areas, but not as dramatic. Such were the developments of the mid-Fifties.

By early 1960 we were becoming increasingly concerned with the problems of malutilization of human resources. The problem not only reflected unemployment, but also the training of people so that they can make a greater contribution to the welfare of this Nation. You may remember that the Manpower Development and Training Act of 1962 was justified in Congress on the basis that it would provide retraining for the heads of families who were unemployed. It was that kind of immediacy which Congress accepted in the passage of this Act.

Because of some problems between the House and the Senate, there was considerable delay in financing the Manpower Development and Training Act, until about September or October of 1962. So nothing really happened under the Act until the close of 1962 and early 1963. Yet, by October, 1963, President Kennedy, in one of his important messages to Congress, dealing with Civil Rights, devoted a great deal of emphasis to the needs for amending and revising the Manpower Development and Training Act. What was the direction in which those amendments were to go? They emphasized the needs of disadvantaged youth and were designed to overcome the lack of literacy skills which resulted in failure to pass tests given in local employment offices. The objective was to increase selection and referral of disadvantaged youth to training programs. The ones who needed training most were being denied training. Congress had previously emphasized assistance to unemployed heads of families but it required that there be a reasonable prospect for employment before selection of individuals for training.

The message delivered by President Kennedy in October 1963 laid the ground for the term "employability." This term is not the same as "employment." In employment offices, our schools, and in other institutions we need to learn the meaning of this concept. We must become concerned with more than short-run considerations which do not solve basic human resource problems. We need to emphasize basic, fundamental types of services for human beings which will prepare them, which will develop in them those traits and capabilities needed for success in a modern day economy. In other words, we must improve employability, and this means more than occupational training. It can and does often mean social services of various kinds, family services, mental health services, as well as the building of literacy skills and occupational capabilities. This represents a major turning point in manpower resource programs in the United States.

Most government agencies providing services to people are accustomed to dealing with large numbers. The statistics in the annual reports of each employment agency point to millions of people who were served at this small cost. Congress has become accustomed to this and the people have become accustomed to providing services to large numbers of people.

In the field of employability, costs rise very sharply. It is an individualized service and, therefore, it is a high-cost service which has to be continued over a long period of time. How are we going to acquaint the American public with this concept? How are we going to orient Congress, accustomed as it is to working on an individual fiscal year basis, to evaluate manpower services that extend over long periods of time?

In the field of employability achievements will not come easily or quickly. We are dealing with the segments of the population, a portion of our manpower about which we know very little. We statisticians, just like the rest of the society, have defined them away as if they did not exist. Ewan Clague referred to the unemployment figures and their significance, particularly for teenagers. There is no doubt that these figures have tremendous significance, but we understate the real volume of teenage unemployment because to be counted as unemployed, one must be able to work; one must be looking for work; and one must not have worked in the week preceding the survey.

Employability then, is a concept which will grow in the United States. It will have increasing significance, much broader than we traditionally thought that it would. This does not mean that we can escape responsibility for employment. Employability is a step toward employment and ultimately there must be employment for these people. I do not want to get involved in the argument between the aggregate demand school of thought and institutional schools of thought as it relates to displacement and technological change which may account for or create unemployment.

We still are living with the tradition that people on public payrolls are suspect. This is in part a heritage of the Thirties. Then such projects were thought of as shovel-leaners, tax-eaters, make-workers and leaf-rakers. We must not forget that public employment in the United States is growing more rapidly than any other field of employment, at State and local levels.

There is no doubt that hiring specifications in the private sector of the economy have become more demanding, more exacting, and more rigorous. Fundamental to this is the need for a higher level of education, greater skill and technical know-how than is presently being provided by our society. There may be limitations in the capabilities of some people to meet all of these requirements. There is a very real question whether the private sector will absorb these so-called marginal people in the work force, even under conditions of full or near full employment.

One of the great tests that lies ahead for us in the field of employability is absorption by the private sector. It may well be that the Appalachia Act, a forerunner I think of other legislation for the Ohio River Valley and the Upper Great Lakes, may provide public employment as a part of regional economic development. Such employment on a long-term basis may develop sections of the country which could become leisure-time and recreational and tourist, areas for our expanding population.

We must break with the traditional and narrow concepts influencing our economic and structural thinking and think more broadly in terms of emerging manpower implications. This means for us in the field of manpower statistics and economics some reassessment and reappraisal of traditional definitions and measures. For example, in the Employment Service, where traditionally we have focused attention on the local labor area, we must start to think in terms of the regional area, and in terms of the interrelationship between manpower resources and manpower requirements. I only cite this as one example of the necessary changes in thinking. For those sectors of the population about which we know very little, we are going to have to learn a great deal more. Some of the higher educational institutions which prepare the nation's professional manpower are farthest removed from some of the major problems of these sectors of the population. The University even including its departments of sociology and social work is far removed from the slums of New York, Chicago or other cities. Often the faculties of these institutions went directly from graduate work into teaching. They may have only a slight relationship and involvement in the manpower problems of poverty and people in poor neighborhoods.

The same kind of problem confronts us for economics and statistics in the manpower field. We need to reassess the information we are getting and how we are getting the data. Many of the techniques and tools that we have used are not applicable. We cannot rely on mail questionnaires and schedules, obviously, for the disadvantaged sectors of the population. And I am not sure that the usual kind of personal interview will yield the necessary information. It may be necessary to develop specially prepared interviewers, not just statisticians.

I said a few moments ago that employability is only a step toward full-employment. Our greatest concern once we get started, will not be just to attract considerable numbers of youth into education, and into training and retraining programs. The problem will be more difficult as we reach toward the really hard-core of the poverty-stricken, culturally-deprived, economically and educationally deficient groups of our population, but I think they, too, can be brought in. The question already raised is whether traditional education and training is adequate for these people. Returning youngsters to the very school environment which they left with disgust or were pushed out of is no solution.

Obviously, we are going to have to reexamine our educational goals and programs. I am optimistic. I believe education is alive and sensitive now to the requirements of the times in a way that it has not been in this country for many years.

Thus far in manpower research we have concentrated on the supply side of the equation. We have concentrated on the numbers and the characteristics and the means of education and training, preparing and developing people. I submit we know relatively little about employment opportunities despite the mass of statistics that we have in the manpower field. The simple truth is, we have not exploited and analyzed the statistics we already have. Consequently, there is a need for much more data and analysis with respect to the demand side of the job market equation.

We are now hopefully in the final stages of completing the revision and shortly issuing the Dictionary of Occupational Titles (DOT) in the U.S. Employment Service. This work has been going on with staff located in eight major occupational field centers. The people are competent State personnel, working under national direction. Although their activities have been directed to the national objective of getting out the Dictionary, in the course of their work, they have visited thousands of occupations. They have observed the change in content of the skill level, the obsolescence of certain kinds of skills, and the emergence of new occupational requirements. We have been experiencing difficulties in keeping pace with the changes that are taking place in our occupations. There is need to enlarge our understanding and knowledge of occupational descriptions, definitions, and classifications. As in any field of science or knowledge, descriptions and definitions are the basic tools for any diagnosis and action depends on diagnosis.

Now that is one aspect of demand. We have made tremendous progress in the field of employment statistics for geographic and industrial breakdowns but we lack such information by occupation. I do not know whether we can get information on employment by occupation on a regular recurring basis but we need it more than once in every 10 years. I would like to get this information from employing establishments. To obtain consistent occupational employment information from employing establishments requires special care in formulating terminology and definitions.

We need information on hiring experience--on the occupational ports of entry. I speak with some feeling on this having just completed conducting a graduate seminar on contemporary manpower policies and programs. I had occasion to review in the literature, an article by Clark Kerr, written some 20 or 25 years ago. It dealt with ports of entry into an establishment. Hiring processes differ from establishment to establishment according to size, to existence of a personnel office or lack of it, and to the composition of its work force and its skill levels. Today there are too little data on the means by which people really obtain employment and how they acquire skills. We need to know more about the requirements of employers.

We have concentrated a great deal on the 5 or 6 percent of the unemployed of the work force and have deemphasized somewhat the 95 percent employed in the United States. Yet the latter constitutes the real manpower resource of this Nation. We know too little about those who are employed.

We talk about training, largely institutional training, and too little about on-the-job training. We have not adequately examined industry's responsibility for the development of skills. How can it open up the ports of entry for some of the disadvantaged youth I have been talking about who are difficult to place. We have not gone into that enough.

The field of job vacancy information has not been adequately explored. A great paucity of such information exists in the United States. Our need for such information for operating purposes outruns statistical considerations. Unfortunately there is confusion between the use of job vacancy data as an index of the level of economic activity and the use of such information for

manpower operations. Perhaps the way to advance the job vacancy program is to obtain the data in order to help people get jobs. Eventually this would produce the statistics. The importance of job vacancy data as an economic index of level of economic activity in the United States cannot be denied. Such data are needed to understand market processes, manpower failures, and accomplishments by area and by establishment and by occupation. There are, of course, difficult problems now in terms of definitions, concepts, and obtaining information.

Another aspect of the demand side of the equation in the job market to which we have given too little attention is the kinds of jobs and the openings and the duration of those openings and what happens when they are filled or go unfilled. When the employer cannot fill a position, he lowers his hiring specifications and makes adaptations, or he breaks up the job duties in some way through job dilution. He may even undertake training of personnel.

We are very conscious of the importance of job advancement in the United States, but we still know too little about the basic elements which are controlling in many occupations.

It seems to me on the demand side of the job market, the whole aspect of the employment process, employment, promotion and training within the employed sectors of the work force requires more attention from the manpower statisticians.

Another aspect of the manpower legislation and programs dealing with job opportunities and employability is the need for economists, statisticians, and manpower specialists to recognize our dependence upon other disciplines and and specialities. This may be in social work; it may be in social psychology; it may be in sociology; it may be in some aspects of vocational education. The interchange and communication of experience and ideas can only be obtained through an interdisciplinary approach. Such an approach requires the development of terminology which can be understood by the whole group. We must have a common language if we are to deal effectively with other specialists. In our youth opportunity centers now being established in various parts of the United States as part of the public Employment Service, it is tremendously important that many disciplines be represented. These centers will have to draw on medical and social services, family care services, psychologists, psychiatrists, vocational rehabilitation and occupational training specialists. Diagnosis becomes extremely important. In fact, it becomes necessary--in some ways, more necessary--to concentrate on diagnosis than to concentrate on service provided. To make such diagnosis will require more than the specialized knowledge of a manpower statistician or economist.

The manpower legislation will continue to put pressure on us to enlarge our vision, our concept, our perspective of human resources, the job market, and the economy of the United States.

I would say that on the basis of what we have been able to do in the last 20 to 30 years, I have every hope, every belief, that we are competent to measure up to that task.

MR. RICCIUTI: Well, it is very easy to see that Mr. Levine has kept in touch with our problems while he has been away at school. I want to thank him on your behalf for his very thoughtful and provocative talk. I agree particularly with his point on on-the-job training, which I think provides a great challenge to industry and for all of us, and represents the main opportunity to solve many of our manpower problems.

And now to speak to us on "Government and Community Participation in the Program of Economic Opportunity," Mr. Hyman H. Bookbinder, who has served as Deputy Assistant Administrator of the National Production Authority, worked for the CIO and the AFL-CIO, was an economist for the Amalgamated Clothing Workers of America between 1940 and 1950; and, except for the time he spent in the Navy, served as the first Director of the Eleanor Roosevelt Memorial Foundation. Prior to the passage of the Economic Opportunity Act, Mr. Bookbinder served as Executive Officer of the President's Task Force on Poverty, and now as the Assistant Director of the Office of Economic Opportunity.

GOVERNMENT AND COMMUNITY PARTICIPATION IN THE PROGRAM OF ECONOMIC OPPORTUNITY

Hyman H. Bookbinder, Assistant Director
Office of Economic Opportunity

I am an enthusiastic participant in and supporter of the War Against Poverty. I think it is just about the most exciting thing that has happened in this country since the early Thirties. I think it has already done magnificent things and promises to do many other magnificent things.

This does not mean I am blind to the problems that we face and the problems created by having the War Against Poverty. It does not mean that I am unaware of the defeats we are suffering in this war as well as the great number of minor but cumulatively very significant victories that we can already point to. Defying all statisticians, mathematicians and logicians, I really believe, in this case that the total is substantially greater than the sum of all of its parts. That is what I think is the nature of the War Against Poverty.

It has already, in the few months that it has existed, shaken up just about every establishment in the country. That does not mean we get a psychological kick out of just shaking up people, but precisely what we have shaken up needed shaking up, and that means the government itself, not just other people; it means us. We have shaken ourselves up. Yes, we have even shaken up the BLS and the BES and the Employment Service. They tell me--I do not think it disastrous--but we have shaken up the social workers; I am told the educational community does not like us. Nobody seems to like us, but everybody invites us to come make keynote speeches.

The War Against Poverty is a challenge to the conscience of America which has been generally very well received. We in O.E.O. are aware that it is not we alone who have wisdom. I know our people at times may get a little overenthusiastic. Those of us who wear an O.E.O. hat know we do not really have

any more wisdom than others. In fact, we probably have less on each of the specific things that needs to be understood, but we are new, we are young in terms of agency, we have a certain kind of spark.

As long as we do not do it too "wise-guyishly," I think it is good to point out failures because the fact is that in these last 30 years there has been a basic failure in American life in which we all collectively join and share.

During my lifetime I remember at least three important socio-economic revolutions in American political thinking. One was, of course, the early New Deal days. I think that whoever was elected in 1932 would have had to do at least some of the things that were done in the New Deal.

But, there was a recognition that the economic system was not working well enough, that the depression and the recessions preceding were just intolerable. Certain changes were needed, and certain changes were made through a whole series of legislative measures, social and economic. These measures certainly represented a basic commitment, and served up to a point. Many things were improved; many things happened; new trails were blazed. That was one revolution in my lifetime. Part of this revolution took form in employment security programs.

The second one, as I measure revolutions, occurred in 1946, when we said that, as a matter of national policy, we cannot just provide for people's individual security so as to minimize their difficulties in a time of economic collapse. We have got to do more than we have done to see that there is not economic collapse, and so at least we committed ourselves to this belief. Some people say we never really carried out the full purpose of the Employment Act of 1946, but the important thing was there was a commitment. And the fact is, despite the fact we can all make criticisms and express our regrets about things that have happened, in these last 20 or 30 years since the Great Depression, we have never had a real fear that we were going to get into another prolonged depression. And, in this period, by all of the traditional standards, this country has bloomed economically.

Measure it by GNP, average wages, national income, whatever you want, we did pretty well. Not as well as some would like, but we have done reasonably well.

But then came 1960, the Sixties, and we look back over this period and say, "Something is fundamentally wrong."

The thing that was fundamentally wrong was that despite the earlier revolutions, despite the greater stability in our economic life, despite the aggregate improvement, despite average wages, and so forth, somehow this economic progress did not have very much meaning for a significant number of Americans--one-fifth roughly.

Roughly a fifth of the American people by any reasonable standard of poverty certainly are so far away from and below what we call the prevailing American standard of living, that they must be considered poor. One-fifth of the American families, the most important single number, live on an average annual income of about $1,800. These are the "below-$3000," group. I have stopped using the phrase, "Below $3,000," because people hear it as $3,000. You do not hear it as "below $3,000." Roughly 35 million Americans are living at that level.

This was the challenge to President Kennedy, and is the challenge to President Johnson, and the country as a whole. What has happened? What is wrong basically? Why is it that so many people do not share in this prolonged economic growth?

We did not invent poverty. That is, the government did not invent the concept of poverty or the need to fight against it in 1963 or 1964. In a sense, The War on Poverty has been going on for a long time. All the things you have talked about, all of the programs you have worked on, the manpower training, the vocational education, ARA, all of these things obviously contribute to a program aimed at the causes, the basic causes of poverty. But, the difference is that for the first time, beginning in the last year, we identified poverty as the focus for our concern and required that almost every program take account of it. I say "almost" because obviously some do not apply. Whenever it can possibly apply we measure the effectiveness of a program to a large degree in terms of what it can do to contribute to the elimination of the causes of poverty.

The new emphasis is not what are average industrial wages in America, what is total GNP, but what have we done about bringing some more families out of the ranks of poverty.

What we have done in the War Against Poverty is to give very, very important meaning to those words of President Roosevelt, spoken, I think, back in 1938 when the Wage-Hour Law was signed. I know very few quotations by heart, but this one I know by heart. He said, "The test of our progress is not whether we add more to the abundance of those who already have much; it is whether we do enough for those who have too little." That is the test of our progress.

And, by that test, we have not done well enough. So we are seeking explanations for the failures in our social and economic life, for those who have been, in effect, "drop-outs." I am not talking of school drop-outs, but social drop-outs, drop-outs of our society measured by the tens of millions in this rich country of ours.

Well, this is our commitment. This is our concern, and like in any other wars, people do not understand it all, we have conscientious objectors, we have armchair generals and Monday morning quarterbacks.

Some say, "You are using old-fashioned weapons; you will never win the war that way." The same words can be applied about the Viet Nam war and the War on Poverty. "There is no will to win," et cetera, and some people say, "you have got to escalate the war or you will never win it." And, they are talking about the War on Poverty. Well, we get advice from all over and some of it is sound advice.

I would like to give you what I think is the basic flavor, the basic idea behind the things that we are doing that constitute the War on Poverty. To do so, I must tell you first the two things that the Economic Opportunity Program especially is not.

First, it is not a welfare program. It is not another program to make poverty somewhat less intolerable. Obviously this does not mean as a humane, civilized society, we are unconcerned about welfare. We need better, improved, perhaps bigger welfare programs, but the poverty program is not a welfare program. The purpose is simple. I have already alluded to that. It is to get people out of poverty.

Secondly, it is not a full employment program. I think it is terribly important for people to understand that unemployment and poverty, while related in important ways, are not the same problem. Poverty and unemployment are not identical problems. Obviously, full employment in the country (or, as a matter of fact, any improvement in the employment outlook) is a contribution towards solving the poverty problem. So we desire to decrease unemployment, and we work on that front in other connections.

But, even if we could eliminate unemployment as you folks measure it, if tomorrow morning we could wake up and find we have reduced unemployment to 3 percent, we would have made only a tiny dent in the poverty problem?

Look at Mollie Orshansky's figures on the statistical profile of poverty. Relatively few of the heads of poor families are unemployed people. A whole range of things can and must be done to guarantee full employment, but we would still have a serious poverty problem.

What, then, are some of the things we do? What is the purpose of the Economic Opportunity Program and speaking of it more broadly, the Poverty Program?

If the purpose is to get people out of poverty, we have to find out why they are in poverty. There is no ultimate wisdom in this area, but certain things are beginning to become apparent, Two or three things are rather self-evident. Certainly, one is the number of old people who probably will never go back into the labor force. Then there are young people who start raising families at 18 or 19 and who are so completely lacking in skill and confidence that they do not even try to get jobs.

All of these facts suggest rather obvious things. We have started to do a few things about this. We do these things out of recognition that the most important single factor about poverty--I did not say the only important

factor--is that the great bulk of our people who are poor today have been poor since the day they were born.

There is no other fact that I think begins to be as important as this fact: that people who are poor today have been poor since the day they were born. This is what we refer to when we say the "cycle of poverty," the "culture of poverty." It is terribly important to understand it, and a child who is born into that poor family and is poor from that first day begins to have a mentality and an attitude and an absence of skill and an absence of motivation, all of which makes it difficult--not impossible--but very difficult for him to ever escape from poverty.

That is why you will find that there is an emphasis in our program--not to the exclusion of other things--but an emphasis on the very young. This project Head Start, for example--which I am sure has affected every one of your communities--is an exciting thing. This fall, 530,000 children will have the first opportunity to be exposed to the kind of influences that are just taken for granted in the typical nonpoor family.

They will get health care; they will get an appreciation for learning, and an exposure to books and crayons; they will get the first exposure to conversation. For the first time, many of them will hear a sentence spoken slowly enough with correct enough diction that it begins to have meaning and importance to the child. What is perhaps most important is that we are going to start a program and a system in the communities that will pay off later for these young people in their lives and for society in general.

Obviously, in 6 to 8 weeks during the summer, you are not going to make up for 5 years of neglect, for 5 years of hardship, and as Mr. Levine has already suggested, if the child goes back to the same home environment where there is not that square foot of clean space for doing homework, where there is a loud television blaring all of the time, or an angry parent, blaring all of the time, that child is not going to be in a particularly new situation of hope, but every little bit is going to help.

I just came back from Berea, Kentucky, where I was able to bring good news about a project. You know, we always think so globally about the hundreds of millions of dollars we are spending and the 35 million poor people. I get lots of satisfaction out of the small things we do, because they are all going to begin to add up.

I was able to inform Berea, Kentucky, that we have reached the first goal in a drive called "Books for Appalachia." We announced a campaign working with the Council of Southern Mountains and the Appalachian Volunteers through the P.T.A.'s of America to collect 1 million books for Appalachia so we can fill the libraries of these 1- and 2-class schools in all the poorer counties of Kentucky and West Virginia. The first part of the million are to go to 44 counties in eastern Kentucky. Just the day before I left for the commencement address in Berea I received word we reached the 500 thousand mark.

Some people will say, "What are you getting so excited about books for, books for these small schools?" We have some reports back from our Vista volunteers in Kentucky; one wrote back saying she found in four schools of a county that all the children were sharing one copy of Mother Goose. That is 1965, U.S.A.

Just this last week we made a grant of over $100,000 to college volunteers in that area who will sort the books and start reading the books to children in these eastern Kentucky counties.

You simply cannot exaggerate, you cannot overstate what it means to start exposing children to a friendly voice, to a colorful book, to things that we have taken for granted all our lives. This is the kind of thing that is made possible.

Let me quickly run through the basic components of our program and where we are. The papers are full of the problems, and we have got them. We work around the clock, working on the problems, but some things have already happened, giving us cause for hope for the future.

One major component that we operate ourselves is The Job Corps. Some people think the Job Corps is the War on Poverty. In the Job Corps, we have an extremely difficult task and we are not sure it is going to work for enough children to warrant all the effort. We are not sure, but we are willing to try it; we are willing to work hard and spend money because the objects of that program are some of the most difficult children in our society, and we have made it a matter of policy, a policy of which I am very proud, that we are not only going to take the "cream" of the young people of this country, but also those with social and economic limitations. We are even taking some children with criminal records but not the worst criminal records; we are not a mental therapy institution, but we are dealing with the kinds of children where it is rare that they have never been arrested.

We are taking children who dropped out of school at third grade, fourth grade, fifth grade; children who have been smoking the kind of things they should not be smoking; we are getting them into these Job Corps centers. I am conceding the fact that we have problems in the Job Corps, but it is worth having these problems.

When the Congress was debating this, one of the major arguments we had to contend with was that we are smoking marijuana or something worse than that if we think that the children toward whom this program is aimed really want to leave their communities and help themselves. They will not want to do this. Well, we surprised them and ourselves, I do not mind confessing, because almost 300,000 young men and women have said they want to be in the Job Corps. Now, they will not all be in the Job Corps. Some of them probably thought it was just a job they were applying for, but at least several hundred thousand of these target children did fill out a postcard, did do something else to say they want to help themselves.

Also, we have the Vista Program. I think this program, also, is exciting. Already some 20,000 said they would like to be in Vista, but only about 2,000 of those will qualify because we have rigid requirements; for example, those who are married must bring their spouse, and when they find that out, some of them drop out. It is noteworthy that we have challenged the people of this country, just as we have in the Peace Corps, and that people say they do want to serve without the glamour of going to Afghanistan or India or that kind of thing; they are going to work--and they already are working--in the hollows of Appalachia; they are working on Indian reservations; they are working in migrant labor areas, doing rather unglamorous work, and we are not talking about just volunteers every Tuesday and Thursday evening. That is important; we are going to have to have millions of them before we are through. We are talking about full-time, Vista volunteers, working around the clock and away from home for a whole year, and if they want to they can work a second year.

The third program that we run directly is Community Action. You have read about the nine-million-dollar grants to New York and about the difficulty we are having in Chicago. We are having some difficulty in certain places, but in the aggregate we are showing signs of success.

We allocated one million, two hundred thousand dollars last week for an Appalachian health program to enlarge and improve a group of hospitals in Appalachia.

Next a half-million dollars went to Detroit, Michigan, part of which will go for a project you would never imagine as part of the War on Poverty. It is a program to train policemen who are assigned to slum neighborhoods. Sound unusual? It did to me at first until I read why it is being done. In one sentence it was noted: "Officials hope that the course will replace poor people's traditional mistrust and fear with a constructive relationship that will encourage them to seek help from the police."

The North Carolina Fund was given a half-million dollars last week to evaluate programs that we fund. Maybe we will talk about this this afternoon when we have a more directly related subject for discussion.

In Shannon County, Missouri, we made a small grant of eleven thousand dollars to finance remedial education for 120 adults of low income with less than 12th grade achievement. This is the first time in that community that any program of this type was ever funded.

Migrant grants, Indian reservation grants, special summer programs are taking place every single day. This is Community Action.

Just a word about Community Action in terms of concept. This is not just an experimental program, you understand; it is an action program, but in a sense the whole Community Action Program is one great social experiment, the greatest we have ever had. Hundreds of millions of dollars will be spent to try out all kinds of new ideas about social organization, about special programs to reach the previously unreachable. You show me any laboratory where

every item that you try is a success. We are going to have failures, but I think we are going to have a substantial degree of success, also.

Well, we do other things in this program. The Labor Department has the Neighborhood Youth Corps called "work training" in the legislation. Already some 200,000 are either on the job or to be employed in their local communities.

Finally, work-experience programs administered through HEW take the most difficult cases, hard-core unemployed, fathers of children receiving ADC and give them extensive assistance; counseling, work training, placement, services, etc.

In concluding let me go back to what I just said much too briefly earlier, It is especially important that we spend a few minutes on this group.

I said, "This is not a full-employment program." That does not mean that the Administration or the OEO is not vitally concerned with the unemployment problem, but we are impressed with the fact that about 9 or 10 months ago, for example, we read a story which I think emanated from the local BLS people in New York, that there were at that moment some 50,000 jobs in New York City; identified jobs in a city where 300,000 people were unemployed.

We are not talking about scientist jobs; we are not talking about greatly sophisticated jobs; but you did have to know how to write or count to be an elevator operator. Despite all of the automated elevators, I am told that one of the important groups of jobs in that 50,000 were unfilled elevator operator jobs. You have got to be able to see what the number on the floor is. To be a waitress, you have got to be able at least to check the right box, if not write down, "Ham and eggs." And there were not 50,000 people available for those jobs, and so we say in the programs we are participating in that we have got to do what we can; we have got to do what we can to get at least those jobs that are available.

I have just this final thing to read because I think it says everything we are trying to do, and it comes now not from a poverty pamphlet or poverty speech. It is the final page of the manpower report of the President. The manpower statement of the President himself, issued several months ago: He says,

> In the Great Society, work shall be an outlet for man's interests and desires...We will have to try, adapt, try anew, and adapt again, but always on to this goal, always on until what is now too often only a dream, but no human talent shall go to waste, that each man shall have full opportunity to be all he can be, that this shall be a reality for all. 1/

The War on Poverty does not guarantee riches, nor guarantee success, but hopes that the under privileged can reach most of his potential, and this, I submit is what the War on Poverty is really all about.

1/ Manpower Report of the President, U.S. Department of Labor, March 1965, p. XVII.

YARDSTICKS FOR COUNTING THE POOR (Teach-In)

Chairman: John G. Myers, Economist
National Industrial Conference Board

This topic, "Yardsticks for Counting the Poor," is apparently arousing a great deal of interest, and we have excellent speakers here who are authorities on various aspects of the problem.

I think we can consider this problem under three general headings. One is level of the yardstick, the consistency of the yardstick; two is persons in different situations: family, location, occupation, and the like; and finally a very important problem that has interested many people is the question of variability of income, whether it is a long- or short-term problem, whether people below the yardstick at one point are people likely to remain in poverty over a period of time.

Our first speaker is Mollie Orshansky, Economist of the Division of Research and Statistics of the Social Security Administration, who has written a great deal on this subject.

Mollie Orshansky
Division of Research and Statistics
Social Security Administration
U.S. Department of Health, Education and Welfare

I notice we are to discuss counting the poor. Since I have been inadvertently responsible for proliferating some of the numbers, I think I should pull back a little and say that perhaps we should spend more time thinking about the methods that will show who is poor, and what kinds of people are poor, rather than concentrate so heavily on the specific number. Certainly, for the Social Security Administration (SSA) and for myself, we disclaim any guarantee that goes with the number 34.6 million, 35 million, or 50 million. Such a figure is a way of defining in the aggregate a short-range answer to a long-range question. We are trying to delineate and identify the groups in the population that are vulnerable to a risk, the risk of poverty, which in itself has no unique description or series of symptoms.

Just to give you a little bit of the background: you heard some of the numbers used this morning which have become quite the thing. Until recently, the under $3,000 a year figure, which the Council of Economic Advisors (CEA) in heralding the War on Poverty used as a delineator was the official dividing line between poor and nonpoor for families of 2 or more.

As things go, this was a device to present a number which could both dramatize and also, what is more important, indicate the degree of concern which we wished to demonstrate. The poverty in this country is not, as some of our not-such-good friends would like to indicate, a symbol of failure. It is a symbol of our success. We can have as a nation and for a long time have had a

society which in the aggregate offers more than a struggle just to keep alive. We have got to the point where we feel we ought to and can make this kind of life possible for all among us. But this also means that the definition to decide who is poor is a very difficult one to make.

When all you are worrying about is sheer subsistence, staying alive, as is true in so much of the world today, you have a somewhat easier statistical problem. Just figuring out who does not have enough calories to stay alive or who does not have enough clothing to stave off the elements gives a workable definition of poverty, but we are not in that state.

There may be, unfortunately, some people in this country who are perilously close to the subsistence level. Even for them, we do not assume that the only remedy required would be to make it possible for them to just stay alive. Once you get past the absolute subsistency level--and it would be difficult to define this level for things other than food and perhaps clothing--you get out of the area of sheer physiological need, and you are in an area of choice: What do you think, what do I think, and when does poverty become a public issue? Most important what do we as a nation wish to accept as the level or the magnitude of the problem to which to address ourselves? The Council of Economic Advisors by the figure they chose indicated that this was a level of about a fifth of the population.

Now, this did not mean that the nation intends to do or can do something for everyone thus identified. It might not even mean that we would like to, but it did mean we wanted to identify the kinds of households that are worse off than others, the population groups who find themselves in our economy left behind while the rest of us move ahead.

Then in terms of the level which the Council used, and bearing in mind that it is an arbitrary level, a rationalization was applied to indicate its reasonableness. One rationalization used was that in some earlier work attempting to identify the kinds of families with children that might be living in poverty, the SSA had worked out an ad hoc relationship between income and food expenditures which we felt implied some concept of adequacy. With the rough demographic characteristics and other data then available to us, we have said that for a family of a husband and wife and two children, and the two-tenths additional relatives which they would have on the average, a minimum poverty line would be around $3,160. But we were varying the line for family size and composition.

The Council, unfortunately, did not have the data with which to do this for all households. The data the Bureau of the Census provides on income distribution does not cross-classify families by many important characteristics simultaneously.

The SSA felt that if you assume, for example, that an aged couple with $2,900 was poor and a family with six children with $3,100 was not poor, that you would be understating the relative dimensions of the poverty problem with respect to young children and large families as opposed to other households.

I, myself, was not going to settle for this rigid definition. So we worked out a family size and composition scale, pivoting roughly about $3,100 as the required minimum for a family of husband, wife, and two children, tapering it downward for smaller families and upward for larger ones, and came up with a new set of estimates which had approximately the same proportion of the population as indicated by the Council, but a different cross-section. We felt it was a fairer way to see that all families who might be subject to economic pressure got a chance to be included under this search-light being flashed on the lowest fifth of our population.

I mention this bit of background because I agree, as our Chairman said, the discussion of the poverty count should clearly separate what we can do, what we must do, and what we have not yet been able to do. You pick the level. This is arbitrary, or at least in SSA we feel it is. Do you want to concern yourself about the lowest third or the lowest fifth or the lowest sixth or the lower half? This is a choice that we must make. There are very few absolutes in this game.

Of course, you like to have a rationale for what you do. We in SSA postulate with the Department of Agriculture that there is a low level of expenditure for food which could if wisely used permit adequacy on an average. We calculate that such expenditures should come to no more than a third of family income, a rate which for a four-person family with children yields a threshold figure of roughly $3,100--an income which no one can say provides for riotous living.

There are some who think this figure is still too high; there are others who think it is too low. But, the important thing is the scaling for differential needs. I think it is true of the various poverty criteria which have been used that if you apply the proper scaling, you do not get very different relationships in the way that the home economics people in Agriculture measure the relative needs of families of different sizes from what Mrs. Lamale and others in the BLS do, from what we in SSA do, and what others do.

I think the persistence or temporary state of low income is one factor we have to struggle with still. We are hoping we will get some numbers in the next few months which will help, but at present there is little to go by.

Whether in defining poverty there are other resources you should consider in addition to income is actually not a "whether." Everybody would agree that you should. It is how much data is available and how to apply it that is the issue. We do find that when you move away from the rather unrealistic single income approach which the Council used, you eliminate some of the problem of the poor having assets which could bring their consumption above the poverty level. It is mainly the aged with low incomes who tend to have assets, yet not even all of them do as opposed to newly forming households.

By eliminating many of the aged couples with such asset holdings from your poverty count, you change the picture considerably. We found from earlier poverty counts that with the criterion we were using--which is a little less than $2,000 for an aged couple and about $1,500 for a single person--even if

you estimate the effect of prorating any assets the aged have over the rest of their lifetime and adding them to current income, you would still count as poor 90 percent of these now considered in poverty solely on a current income basis. From everything we know this 10 percent is the greatest reduction you will make in the poverty count for any age group.

Next, I want to move away--even though it is not strictly in the topic--from counting the poor to talking about who is poor.

We are interested for this purpose in an aggregate. We are not assuming that for eligibility for particular programs, for assessing the plight of an individual family the way a social worker does, that any criterion you would pick to define a level would be inevitably accurate. We do believe this would require additional facts. I do not think anybody quarrels with that.

We all know that even for purposes of deriving a crude leveller, we need much more basic research than we have. We would like budget yardsticks or some other measures which seem more objective. We should remember, however, not to be fooled by the label. There really is very little in the way of so-called scientific objective evidence we yet have, or perhaps ever can have in a rapidly developing economy, which would enable one to say for categories of living other than food what is an essential and what is not. And I think even Dr. Clark will tell you that we sometimes have our doubts about food. What we do think is important, while we are waiting for basic research to bring forth some more powerful discriminant, is to look at the composition of the group we identify.

When you have differentials in economic welfare so great as we do so that families with five or six children are three or four times as likely to have incomes below this very low poverty level than families with one child or families with no children; when you see that 60 percent--and I call this an immoral figure--60 percent of nonwhite children are growing up in families with incomes below this threshold, indicating a poverty rate four times the rate for white children; when you see that although there is unemployment among our poor we find even among white men that the families of 6 percent of those who have worked all year at a full-time job in 1963 are poor, and over a fourth of the families of non-white men who have worked that much are poor; when you see that a very large proportion of the children growing up in homes with a woman at the head are poor whether or not she works--and most of the time she cannot; when you see that for some of our non-white population there is very little difference in the kind of living a man can offer his family when he works as opposed to when he does not work; when you see this, that the differential risks of poverty for some population groups are twice, three times, or four times the rates for others, you know--or at least I think we should know--that even if we could adjust the measure, even if we had a better device, we could only narrow the differentials. We could not wipe them all away. For the purposes of the Economic Opportunity Act, and some of the programs that are going on in other agencies, we are not counting the poor as a hostess counts guests when she plans a dinner party, setting out exactly enough plates: We are not even trying to have half enough. If we can identify some of the vulnerable groups, we can then think of the kinds of programs which to institute. We can delineate in

very broad terms the numbers of people whom we might reach if we wish to take the effort and the time, and then I think we are concentrating on what is the real problem.

How you should best count the poor and who has the best count depends first on the assumptions you wish to make and eventually on the basic research which all of us should be doing. I find--as I said to Mrs. Lamale and Dr. Clark, and I think they would agree--that we are all currently struggling in an area where we are asked to give answers to impossibly difficult questions in an impossibly short time. You cannot beat that kind of rap because if you say you have no answer then you have failed at a crucial moment when action is contemplated. If you produce an answer which is acceptable in an interim sense, then you often find it gets frozen into the mythology and you are not given an opportunity to complete or amend it.

Though this is supposed to be a panel on the different methods of counting the poor, I would like to end plaintively: I wish we could concentrate on thinking up the solutions and dreaming the big dreams that we need to have in order to solve the problem of poverty, even if we cannot yet agree on the one and only perfect way to measure the poverty level.

DR. MYERS: Our next speaker is Helen Lamale, Chief of the Division of Living Conditions Studies, Bureau of Labor Statistics. She will discuss what variations of family characteristics and locations should be taken into account in counting the poor and how this should be done.

Helen Lamale, Chief
Division of Living Conditions Studies
Bureau of Labor Statistics
U.S. Department of Labor

What has been disturbing me in most of the discussions on yardsticks for counting the poor, is that it seems to me what we need for measuring poverty is not yardsticks but sliderules. The measuring of poverty in a statistical sense is matching family needs against family resources. Persons who have struggled with a loose or an inaccurate sliderule know that when you have errors in either scale you get some very peculiar answers. The estimates which Miss Orshansky has made in refining the original Council of Economic Advisors' count demonstrated how important it is in the needs scale, to distinguish different needs for families of different age, size, and composition. She indicated, also, in the adjustments of the resources scale, the importance of making an allowance for the value of home-grown food for farm families.

My concern has been in all of the debate that has been going on about where the poverty level is, or where it should be placed, that the limitations of using current money income as a measure of family resources will be disregarded as unimportant or overlooked. I think there is a tendency when statistics are used for them to become frozen. Assuming that the original use of Census money income as a measure of the poverty level was justifiable, since

it was the only available statistic for the Council to use, the danger is that the appropriateness of its basic definition and its limitations for measuring poverty will never be re-examined, but in the future will become increasingly accepted as an adequate definition.

On the needs side another area of concern is that, having now made allowance for differences in the needs for various family sizes, compositions, etc., place-to-place differences in living costs will be overlooked or disregarded. So I feel that the challenge to statistician and analyst is primarily not to keep polishing, refining, and arguing over what has been recognized as stop-gap measures which were necessary to launch programs and to define the broad dimensions of the problem, but to look behind these arguments and try to define the basic research needs. This is essential if we are going to come up with some improved measures of poverty.

The limitations of current money income measurement are of two dimensions. The first is a well-documented fact that the Census definition of the income-receiving unit, i.e. the family as it must be used for a variety of purposes is not necessarily the correct incoming-receiving unit to use against family expenditures, or family budgetary needs. These Census definitions and procedures were developed in the postwar era. They were developed as a part of the labor force and population surveys, and are essentially demographic definitions of families and individuals. While this has relatively little impact on the measurement of average family income and its trend, it has a very large margin of error in the extremes of the income-size distributions. The net effect of these definitional and procedural limitations is an overstatement of the low end of the Census current money income distribution which is more significant for the single consumer living alone than for families.

The other aspect of the limitation of current money income as a measure of resources in defining poverty is the different resources that are now available to a family over and above current money income as presently defined. Much of the discussion of this point--and I think Miss Orshansky raised this issue--has had to do with the use value of the home or assets of the elderly. This is an important consideration as you go down the current money income scale, but, more importantly, across the whole income distribution our consumer income and expenditure studies have shown that families have a variety of receipts of goods and services without direct expense--for example, the receipt of medical care under policies paid for by employers under contract bargaining agreements. Some nonmoney income, of course, is received in connection with assistance programs, e.g., medical care, as well as through food stamp and the various food programs.

Another important resource of families is the use of credit. In an income classification, we find at all levels of income families do have credit available to them. This reflects the fact that, at a given time, there are both transitory and permanent income components in the low-income groups.

So I think that what has to be recognized is that families with low incomes, on the average, spend or consume in excess of current money income in sizable proportions.

In 1960-61, the current consumption expenditures of U.S. nonfarm, 4-person families, with incomes below levels equivalent to $3,000 to $4,000 exceeded their current money income by 50 percent; their total value of consumption--expenditures plus goods and services received without direct expense--exceeded current money income by 70 percent.

Two- to five-person families had expenditures for current consumption from 20 to 25 percent in excess of current money income, and total value of consumption, 35 percent in excess. For the very large families with equivalent incomes (these were, of course, at a higher current money income level) there was a 9 percent excess of current consumption expenditures over income and 16 percent excess of total value of consumption.

The problem is not so much of a problem when talking about the current overall dimension of poverty but it becomes very much a problem when establishing levels and procedures for measuring improvements because many of the improvements contemplated under the Economic Opportunity Act will provide nonmoney income benefits, e.g., medical benefits, educational benefits, etc., and only at a considerably later stage, if at all, will such benefits be reflected in current money income.

The other aspect of this is the great fluctuations in the composition of the families in low income groups. This has generally been attributed to transitory versus permanent aspects of low income--families are found in the low income classes one year, and the next year they are not there. Herman Miller has estimated something like 40 percent of the families found in the under $3,000 income group in one year were not there in the following year.

I think a much more serious consideration for research persons is the fact that the actual composition of the families, the families themselves change. Families with very low economic status are very unstable, and so the composition of the family is changing as well as the income status of the families that do remain stable.

There certainly is need for a lot more research on this. The BLS has proposed the use of the consumer expenditure survey data as an approach to this, but has not carried through any analysis. This is a little ironic. The general purpose tabulations of the 1960-61 survey, in accordance with the usual procedure, have been designed for measuring trends, paying attention to the averages and evaluating them as to whether they add up to the U.S. aggregate, but the original purpose of consumer expenditure-income studies was for social welfare uses. It was the distribution rather than the averages and the aggregates that made them a valuable research tool, particularly in the Thirties when emphasis was centered on poverty analyses.

The other aspect of concern to the analyst that I mentioned is the problem of the place-to-place differences in living costs. The adjustment which was made in the Social Security Administration analysis of poverty levels, in effect, allows for the nonmoney income of farm families in terms of goods and services the farm produces for family use, as apart from business, but this is not the same as allowing for place-to-place differences in living costs.

On the needs side, there can be no question if the aim is to measure the cost of basic needs, that they vary from place to place. Now, conceptually and policywise, there is a question of whether for a national program you need a single standard, and many of our programs--as Miss Orshansky will be the first to point out--do not allow for variations due to place-to-place differences in living costs.

On the other hand, many of our programs have taken account of such differences, particularly in the housing area. The basic research is very weak, or, I should say, the basic data are very weak at this point in terms of place-to-place differences in living costs. We have a City Worker's Family Budget which was priced in 20 very large cities in 1959 and has not been priced since. The overall difference in cost was about 20 percent from the lowest to the highest cost city. These cities were all over a quarter of a million in population. I have many telephone calls such as the following: "We understand you did a survey back in 1959, and you find that living costs did not differ substantially from place to place, or significantly from place to place."

Well, what is "significant" in terms of living cost differentials? Is 20 percent a significant difference? Probably not in terms of aggregate estimates and aggregate counts of the poor because they in part balance out when applied against the income figures for individual localities, but when the data are used for deciding eligibility regulations and for evaluating programs and the magnitude of programs in particular locations, then a 20 percent differential is pretty high. I do not want to stop here with the implication that if we had a really good program for measuring differences in living costs that 20 percent would be the maximum. The housing differentials, the largest differentials among the 20 large cities, would probably be greater if we had appropriate living cost indexes for small urban places or rural communities because housing is the one thing which varies most across various areas and regions.

Three years ago, the City Worker's Family Budget--in fact, our total standard budget research program--was reviewed very carefully by a non-Federal government user's advisory committee which recommended that budgets be developed not only at the "modest-but-adequate" standard for these two family types (the city worker's family and the elderly couple) but also at a higher and a lower standard, and that these should be priced in the 23 largest metropolitan areas, and in a sampling of middle-sized and smaller communities.

They also recommended--and the present audience I think is particularly interested in this recommendation--that a budget be developed for a single working woman which could be used as a national benchmark for the states to work with in developing their own minimum wage budgets. The committee recognized that this did not relieve the individual States of their responsibility for developing appropriate deviations from the national benchmark budget, but would provide guidelines to the States in their work.

Another recommendation of the advisory committee--and certainly this is an area where we need a lot of research--calls for a review of the family-size scales that have been in use for estimating budget costs, particularly with respect to their appropriateness at the lower end, or extreme ends, of the

income distribution. Thus, I think all of us who have been struggling with the problem of poverty measurement would say what is really needed now is not arguments on how to embellish the stop-gap estimates and efforts to decide about who is right and who is wrong, but to get ahead with this long-run and basic program of research.

This is the point at which national, state, and local groups have an amazing amount of information available, and certainly as a part of the Office of Economic Opportunity and Community Action programs, a lot of information will be coming available at the local level which will need analysis. For example, the urban medical study in New York City is doing a lot of work in terms of the value of medical care provided in relation to income and family composition. They are coordinating this with some of our consumer income and expenditure reports, and I think will be coming up with some very valuable benchmark statistics from which to measure the future progress of providing better medical care for a local group.

DR. MYERS: Thank you.

I will ask Faith Clark to speak next. She is Director of the Consumer and Food Economics Research Division of the Agricultural Research Service, United States Department of Agriculture. Her topic is "Where and How Do You Draw the Line for Nutritional Adequacy?"

Faith Clark, Director
Consumer and Food Economics Research Division
Agricultural Research Service
U.S. Department of Agriculture

In the Department of Agriculture we have had a long history of work with food budgets and food consumption surveys and are, of course, concerned with nutritional adequacy. Our food budgets have been widely used in setting some cut-off points for the poverty line. As a matter of fact, Miss Orshansky started with what we call our "economy plan" and also used our "low cost plan."

Now, these food budgets, that the Department has and keeps up-to-date, were first developed at the beginning of the depression as a means of helping families get the most from the money they had to spend. It was recognized that there were a great many people with very low incomes and in very bad shape, and so these food guides were really devised to try to help families do well nutritionally with the money they had.

They were used then quite extensively and are still used very extensively by social workers in developing their public assistance standards.

We realize that they have many limitations. We do have the advantage in the food budgets of starting out with something that is scientifically--I hate to say "determined"--but a set of nutritional standards. The National Research Council has a committee of nutrition scientists who every five years publish "recommended daily dietary allowances." These are in terms of calories, proteins, minerals, and vitamins. This is a joint committee effort representing

the judgment of a group of scientists. They recognize that there is no one minimum amount of any of these nutrients. That is why they insist they be called "recommended" dietary allowances, and they do change.

In developing the food budgets, we use these recommended dietary allowances as our nutritional criteria. We also take into account the relative economy of foods; that is, we know from our studies of the nutritive value of foods and the prices of foods, which are the cheapest foods for the amount of money. We know, for example, that grain products provide quite a goodly supply of protein and minerals and some of the "B" vitamins for the money spent. Meat items are higher. Milk is a very economical source of calcium, and so forth. Then it is possible to use these two sets of criteria to develop the quantities of foods that we might suggest be used in low-cost budgets, but note that it is still necessary to translate nutritional standards that is, calories, proteins, minerals, and vitamins into foods. And this can be done at a variety of cost levels.

It is important if these budget plans are going to be useful recommendations that they conform in some part to people's normal food habits; otherwise, they are not going to be followed nor are they going to be realistic.

It would be possible, of course, to develop a food budget using just five or six foods, which would be a nutritionally adequate diet, but it would be the type of food that nobody would eat. It would not be the kind of thing that would be helpful either as guidance material or for use as any kind of minimum standard for budgeting purposes. So we use data from our food consumption surveys as a basis for translating these nutrient allowances into foods. For the low cost food plan we make this judgment on the basis of the food consumption patterns of low income families.

This is the basis, then, for costing the food budget. We get the weights we use in costing the low-cost food budget from the food habits of low income families, and then we use the food habits of moderate income families for costing the moderate cost budget, and so on. This in effect does lead to a circularity because we are starting with food patterns of a particular income group. Yet all our budgets do provide for nutritionally adequate data.

If the low-cost budget is used in determining what the total cost of a market basket of all goods and services needed by families might be, there is some circularity in the total process.

We are able in the food area to judge the suitability of the budgets by estimates of how many families spend enough to obtain the economy food plan or the low-cost food plan, and how many of these might achieve nutritionally adequate diets. We know that not all families are going to be able to obtain adequate diets on these rather low amounts. Social welfare workers frequently say that it takes an experienced nutritionist or home economist to do this. We realize that families do need counseling and do need help. We are able, however, to give some estimates of what the likelihood is for families spending specified amounts of money on food to have nutritionally adequate diets.

We know that if families spend the amount of money we estimate is needed to buy our "economy food plan," only about 10 percent of them are likely to get nutritionally adequate diets. The corresponding figure for the low-cost plan is 25 percent. Thus, it is true that it is not likely that very many families will make the choices needed to obtain an adequate diet with these low amounts of money for food.

On the other hand, many people who spend a great deal for food do not get nutritionally adequate diets, so that you cannot use these figures without comparison with families throughout the entire income scale.

We have also attempted recently to develop some clothing budgets. In clothing, we do not have the basis of any kind of physiological standards that we have for food. The only thing that we have been able to find to check the estimates we are working up are some data on the growth of children's feet and, thereby, getting at some sort of reasonableness of whether or not we are allowing enough for shoes in the budget. Otherwise, almost all of the determination of clothing needs must be based upon what people customarily do and there, again, we get around to the problem of whose customary patterns are we going to choose? We just cannot make them up out of whole cloth; you have to have some data. Fortunately, we do have consumer expenditure data, but the problem here is to get away from the circularity of reasoning of taking the patterns of a particular income group and saying, "This is a clothing budget."

For other items in the family budget there is really much less to go on than we have for food and perhaps even for clothing. There are some standards that have been developed for housing, but it is, of course, a very difficult problem to translate those standards into a specified dwelling unit which you can go out and price.

I might just close my remarks by saying that in the food consumption area we are expecting to have a wealth of new data on which to base a revision of our food budgets and do additional analyses on dietary adequacy and food economics. We are in the process of making a nation-wide food consumption survey which will provide us with the opportunity to judge trends in food consumption of different economic groups in different elements of the population. This survey will parallel surveys that were made in 1955 and 1942 and in the 1930's, so there will be some interesting trend material. This kind of material provides a useful measure of trends in well-being as we can estimate the percentage of families who have nutritionally adequate diets. It will be interesting to see in the 1965 survey whether there has been continued improvement or a retrogression in the line of improvement that we have been seeing in this country over the years.

A Pie-In-The-Sky Yardstick

Eugene Smolensky, Associate Professor
of Business Economics in the Graduate School of
Business, University of Chicago

Well, I agreed to come, and then I sat and wondered why it was that anybody would want an academician at these meetings, especially when these ladies

were going to be here, because of course this field belongs to these ladies of the Federal Government, not only the ones who are here, but you know all the names: Faith Williams, Lenore Epstein, and Margaret Stecker, and Eleanor Snyder, and the woman who taught me everything I know in this area, Dorothy Brady.

I can only conclude that what you really want from an academician then, given the fact that the field belongs to these ladies who have done such an eminently successful job, is that Mr. Keim wanted someone to compare them with. You get all the sensible observations of all the sensible people doing the sensible things, and from an academician you get some ivory-towered nonsense that makes the other look as good as it really is. I thought that was a great challenge and that I would rise to it and see how far into the clouds I could get.

What these ladies do, obviously, is eminently sensible: they draw a poverty line; they try to establish some kind of minimum income on the basis of some kind of definition of need. The problem is not uniquely theirs. It's really, I think, quite analagous and a little bit simpler than the problem of trying to establish, say, adjusted gross income classes for the income tax. When we establish these classes, when we establish adjusted gross income for tax purposes, what we're trying to do is pigeon-hole people in a way, in such a way that if we take a dollar from any two people in the same pigeon-hole we'll inflict the same amount of pain. So what you want is some kind of way to equate people by the degree of satisfaction they are achieving, only the tax people have a harder job, they have to move from income class to income class and still cause the same amount of pain.

I think that all of the quibbles with the poverty line are quite the same as the arguments over adjusted gross income and all the same arguments come up on what to do with transfers, what to do with permanent versus transitory income, what to do with the price level, what to do with assets as apposed to income, what to do with age and disability, and so on. And I think that the place the tax people are driven to is that we shouldn't be using income at all, but we should be using consumption as the tax base, and I think probably the same thing applies to poverty, and when and if we get a consumption tax instead of an income tax, as all the pie-in-the-sky academicians are urging, then we will finally have the data to do a sensible job on the poverty line, also.

Now, there is an alternative, and the alternative is what makes the poverty line so sensible. The alternative in the measurement of poverty is to talk not about need, but about the distribution of income. What we could be talking about instead of how many people are below a poverty line and how this changes over time is what has been happening to the share of income going to the lowest, say, ten percent of the population, something like that. That's the most common measure. It is an unbearably hopeless measure. I hope none of you will ever use it. It yields untenable results. For example, it says that poverty is today as serious a problem as it was in 1900, since the data show that the share of income of the lowest quintile of the population has not changed since 1900.

The share of the lowest quintile doesn't take account, of course, of the changing socio-economic characteristics of the lowest quintile; it doesn't allow for the fact that they are increasingly outside of the labor force; it doesn't account for the fact that they have increasingly smaller families. It just is hopeless, but you must be prepared for it: Those people who are the most severe critics of our mixed economy's ability to deal with poverty commonly take as their measure the share of the income going to the lowest quintile. That's what Kolko does, and that's what Harrington does sometimes, but not all of the time.

On the other hand, if you decide that the poverty line is a meaningful concept, then I think you are immediately driven to some conclusion about what that poverty line ought to say about the distribution of income. Assume there really is a poverty line. If there is a poverty line, then poverty is something different from low income; that is, there is some abrupt change from being in poverty and not being in poverty. We now say that that occurs at $3,000. I'm sure Miss Orshansky never dreamed that that line would get canonized in this way, but it has happened, and I for one am prepared to accept it or some other line or at least a notion of a line or at least a notion that there is a difference between having a low income and being poor or being in poverty.

I can think of a sharp break of two kinds occurring. I think what we want the poverty line to do is to say that if people earn less than this amount, then not only do they have troubles and not only are they of low income, but that they also create social problems and inefficiency for society as a whole, and that for that group it would be cheaper for us to do something than to do nothing, and that's what I think the poverty line ought to strike at.

One way that this might happen is that the people who are below this line will take some kind of defensive measures when they might not otherwise. The most likely defensive measure, of course, is to raise the participation rate in the family; that is, to send either mother or the kids to work. The consequences of sending mother or the kids to work are these: If they send mother to work, then we generate social problems that are quite expensive right now. If they send the kids to work and thereby forego income, then they consign those kids to poverty in the future. We want our line, then, to tell us when it is that people who are below that line are going to take defensive measures that are going to be expensive to the society and which can be solved more cheaply than doing nothing at all.

So the kind of inefficiency I have in mind is this: suppose the poverty line is, in fact, $3,000; suppose that a family earns $2,600. As a consequence of being $400 short in income, it decides that the sixteen-year-old boy must go to work and give up an education. Well, suppose the consequence of that is the foregoing of a 30 percent rate of return per year. (In fact, some estimates of the University of Chicago suggest that it is a foregoing of something close to 38 percent per year.) Suppose, however, that the government can raise these funds at a cost of 15 percent per year, or something less than 30 percent--it doesn't matter--and as a consequence of transferring this $400 to the poor, this young man would be kept in school. In that case, the economist would say it is

clearly optimal for us to arrange some kind of system of transfer payments to keep the kids in school.

I can think of another kind of inefficiency that might be generated if the poverty line were accurate and if there were a growing number of people beneath that line. This one affects the upper end of the distribution, not the lower. Suppose as a consequence of increasing poverty--poverty now being defined in the right way--people who are not poor begin to take defensive measures. Suppose they fly from the center of the city to the suburbs, for example, because of fear or unsightliness or whatever it is that drives "respectable" people away from the poor. Well, then, in this circumstance it might be that the cheapest way for any single family to meet this fear is to move to the suburbs. On the other hand, if all of the non-poor want to move to the suburbs that solves the fear problem, but it is obviously much cheaper from society's point of view to arrange for transfer payments, to arrange for police and fire protection, to arrange for an Appalachia program, than to lock the poor in someplace and not let them out. There are lots of different ways by which it would be cheaper to meet this problem.

What I am suggesting is that it might be nice if we discussed the Poverty Program in terms of efficiency and not in terms of equity because we might get some agreement on efficiency, while I think we might not on equity.

Now, if you really believe that the poverty line tells what's happening to the proportion of people under it, how they are going to behave, then I can tell you that I don't know what that line is, and that's what I want these ladies to do: tell me what that line is. But I can tell you how it must behave over time. I know that it must rise over time, and I know that it must rise reasonably fast.

There are, it seems to me, three kinds of forces that must push that poverty line up over time. I have given them very loaded names. I call them bias, envy, and egalitarianism, but now as I explain them they will lose all their glamour.

By bias, I don't mean anything more than statistical bias, and the fact that this society seems to grow by generating an increasing proportion of intermediate products that must be consumed by households: credit costs, transportation costs, urbanization costs, and the like. Social accountants are all agreed that the growth statistics of the United States, or any developed country, are biased upward by the fact that we include some portion of these intermediate products as final products. Well, the significance, of course of the bias problem is that these are things that must increasingly show up in household budgets of the poor, and there must be an increasing allowance for them. Of course, these ladies are not unaware of this fact. The transportation component, for example, of the minimum-decency budget has been rising at a very rapid rate. We are not at all sure, however, that all of the elements of statistical bias are indeed covered.

Now, there are two other types of things represented in those two examples I gave. One was envy; that is, if you are poor and everybody else's income is

going up and yours is not, as a consequence of this you feel a reduction in utility and you take defensive measures. That's envy. All of us feel envy. The only difference is that if you define the poverty line right, the response of the poor to envy will be anti-social behavior, expensive behavior, behavior which the rest of society would want stopped. This wouldn't be true for all the rest of us middle-class folks who are as envious as anybody else.

Now, when you get to the other, the egalitarian motive, it is intended to take up this matter of hiding from poverty that Mr. Harrington has made us all so aware of. If what we will do in the face of poverty is to hide from the poor, to make expenditures to get away from the poor, how will it be done, and what kind of magnitudes can we expect, and what kind of empirical results might we expect? Well, I should think that we can't say much about this, but you should be able to expect that the income elasticity of demand for egalitarian expenditures, that is, the loss in my utility due to the growing poverty among others must increase with my income.

Well, if you assume, as seems reasonable, that the income elasticity of demand for the egalitarian sentiment, so to speak, is unity, then I would think that this egalitarian motive, this egalitarian aspect would be larger than and encompass the other two, bias and envy, so that my expectation is, or my feeling is, that while I don't know what the poverty line is, the line as a standard measuring device ought to rise at least as fast as the gross national product per capita. Otherwise, we will get the kind of expenditures that are wasteful as we try to avoid seeing and coming into contact with poverty.

Now, the fact of the matter is that the persons engaged in measuring poverty have not raised the poverty lines as fast as the increase in per capita gross national product, and in fact that's the reason why we have been able to claim a decline in proportion of families in poverty since 1947. If you take and investigate a time series poverty line, as I have had occasion to do recently, (take for examples the National Resources Committee's $750 for 1935, take the 1947 figure which underlies Mr. Lampman's statistics to $2,500 in 1947, and take the current $3,000 line) what you find is that this line is moving up much more slowly than gross national product per capita since 1947, so that from 1935 to '47, we have had a decline in families in poverty as measured this way from 35 to 25 percent of families and since then from 25 percent to about 20.

Now, the 35 to 25 drop, would hold up if the poverty line were defined in terms of gross national product per capita, but the last 5, the decline from 25 to 20 would not have, in fact, occurred. I think the ready acceptance of the $3,000 line stems in part from the fact that we have been busy spending the last decade and a half finding ways to isolate ourselves from poverty, to make the poverty problem less serious and less important to us as individuals, and that's why our income elasticity of demand for a poverty line has been less than one.

I think it is clear enough what I would like. I would be satisfied to take the $3,000 line or any line on which we have a consensus. I wouldn't worry so much about trying to measure calorie content and food requirements and clothing requirements and counting the toilets in houses. All of these things seem to me not very relevant any more to the poor in this society. What we need is a

poverty line that tells us when it is that people above and below that line will be driven to behavior which is not socially desirable.

Now, how do you get that? Well, obviously I don't know. That's why I accepted the invitation here, so that I could pose the problem and hand it on to the people who have to work with it.

DR. MYERS: Well, now, the discussion between the panel members should begin at this point. Would one of the ladies like to take on Mr. Smolensky at this point?

MISS ORSHANSKY: I don't know whether you could call this taking on Mr. Smolensky, but I have something to say in reference to the last remark he made.

I have to confess to you, if it wasn't obvious from my remarks before, these are not just numbers to me. They are people; they talk. Although intellectually and professionally I worry about all of the limitations and why we aren't allowed to wait until we have something good before we must have something to say, the numbers won't let me wait. I'll try to race through some numbers which I think are relevant to the points that have been raised, so fasten your sliderules.

Mr. Smolensky stated that if we raise the poverty line, and I am glad that he asks that we do, he would want to raise it parallel to GNP. I still have a little bit of feeling left in me that the poor should not do quite as well over time relative to the rest of us, so I would raise the poverty line a little less than the GNP and not have people say we are making it possible for somebody not to work and still live as well as those who do.

But if we say the poor, unless we do something, may end up in anti-social behavior, let me tell you, that going by the numbers, they already have. We look at numbers and we don't know whether we see cause or effect, but I think it is effect, that something has happened. Mr. Levine this morning talked about the problem of employability. I sit here and gasp at what I see when I compare poor and unpoor families. I don't like to think people are poor because they are lazy--I don't believe that is true. But I see that in the poor families compared with the non-poor, first of all, there are fewer people who can work. Half of the people in the poor families are children compared to only a third of the non-poor and in the main they are younger children. Many more of the members of poor families are women.

Even when you allow for this, age for age, man for man, and woman for woman, the proportion of members of poor families who are not even in the labor force, who don't even say they are looking for a job or presumably would take one if offered, is higher, much higher than in the non-poor families.

Even if this only means--and I wish it only meant--that people who have no hope for a job no longer say they are looking for one, it is a problem, and it isn't explained by disability.

I see that among teenagers, who stay in poor families--and a lot of them leave because they're not going to school and they're not going to work, so they might as well go off and maybe start their own poor family--we have a much higher proportion of drop-outs than among the teenagers in non-poor families. For this group the unemployment rate is high, but it would be higher if we could count in some of the ones who don't even say they are in the labor force.

We have a much higher proportion of broken families, families with a mother and young children, among the poor. We know from other research that it is low wage-earners who tend to have larger families, and that mothers in broken families have had more children than women of the same age and race still living with their husbands. I wonder if these families are poor because they have no husbands, or if they have no husbands because they are so poor. Maybe one of the reasons they have no man around now is because when he was there, the family was poor and the problems of a family with too many children and too little income became just too much for him.

When you want to take cognizance of differential economic status by family size--I am sure others have noted this--we now know it isn't enough to just classify families by number of persons. You have to find out how many of those are children because the income distribution for families with several adults is quite different from that for families with several children.

For example, for families of five persons with a husband and wife if there are no children under eighteen in the family, the median income, the income which is above what half of them had and below what half of them had, in 1963 was $12,560. For a five-person family of a husband and wife and three youngsters, the median was $6,900.

You can't put all of these dissimilar situations together in a family size cluster and not come up with findings on assets holding and values of consumption which may be completely wrong. I am concerned about the children in the low-income families. These are the ones who may grow up without any hope at all.

You will find in your unemployment statistics that the number of currently unemployed family heads among the poor was only 10 percent in March '64. But if you look back at their work experience during the previous year, a fourth of the men who were in the labor force in 1963 and were the heads of poor families, were unemployed at sometime during that year.

You have cases among our Negro families where a man out of the labor force because we have programs for such a contingency, does almost as well for himself and his children as when he tries to find a job.

I don't think we have to speculate about the possibilities of poverty causing anti-social behavior. I think we already may be looking at such behavior and not recognizing it as such because we're thinking of it as the cause of poverty rather than its result.

I want to say just one more thing about the persistence of low income. We do need to learn more about it, but even what we now know indicates we are comforting ourselves too much if we think that many of our poor are only temporarily so. Even with the flat $3,000 line, and even omitting the poor families that might have disintegrated because a man died or ran away and the family broke up, a survey of all families reporting for two years found 70 percent of those having income under $3,000 in one year had no greater income in the second year. Moreover, for the families headed by a man with less than eight years education who worked all year, 80 percent of those poor the first year were also poor the second.

Of the families with an aged head, 80 percent remained poor over the two years. What we have to do is to disentangle the statistics, to disaggregate them, but at the same time not to forget that we cannot tell from a snapshot whether it is a beginning, an end, or just an ongoing problem.

Dr. Myers: Is there another comment at this point?

Mrs. Lamale: This is in connection with how you measure envy.

Dorothy Brady, I think, is the one who made famous the fact that keeping up with the Joneses isn't something to be ashamed of if you can be sensible about keeping up with the Joneses. She pointed out the fact that the advertisers, and so forth, would lose a very strong appeal, and our consumption expenditure changes would have been quite different over the last fifty years if there hadn't been a strong appeal among Americans to keep up with the Joneses in a very real and constructive way. So our problem, I think, is finding out from sociologists and the motivational research people how to set the point where envy takes over and the desire to keep up with the Joneses becomes a destructive force.

The other point that I think we might make, Faith Clark talked about the clothing budgets and the circularity of income. Originally in the City Worker's Family Budget Dorothy Brady introduced the concept of income elasticity in terms of developing standards for goods and services where there were no scientific objectives, or whatever you want to call such standards as the nutritional standard for food. So there are basic techniques which have been applied to consumption data which would lend themselves to this kind of approach.

We found in 1959 when we analyzed the 1950 data, as compared with the analysis of 1934 data, that the income elasticity points for clothing had changed quite appreciably. Now, there are some methodological problems, but the elasticity points for clothing were much lower in the 1950 data in terms of the income distribution and much more comparable to the basic food elasticities discovered in the mid-1930 data.

Mr. Smolensky: Helen, I think if you kept using the inflection points and logistic functions, that what you would find is if you accounted for everything, the poverty line would rise proportionately with income.

Mrs. Lamale: Not completely; if my memory serves me you don't give them quite as much.

Mr. Smolensky: Well, I don't know why you are giving them quite as much. I wasn't saying anything about levels. I was only saying things about rates of growth rather than about levels, but I think that those inflection points must be very closely related to permanent income, and I think that anything you get, any shifts you get away from a rate of growth that went along with income, probably has to do with the transitory components of income, so that if you really wanted to get something that would guarantee that the poverty line rose with per capita income, I think that those inflection points would get pretty close to it.

Mrs. Lamale: It introduces the preference patterns associated with the discretionary income in this, and the inflection points are quite different for the basic commodities, basic goods and services, than when you get into discretionary spending because then the dispersion becomes so great that you can't really measure the trend.

Miss Orshansky: What Mr. Smolensky says leads me to say that if we unfroze our thinking a little bit and began going in a sense outside a single consumption category to seek the combined inflection points for all the consumption categories, or for two or three, that we might do better. We would then say that food competes not only with food, but perhaps with, let's say, a car or a vacation; or buying a fur coat, which is part of clothing, may compete with a trip to Europe or having a maid.

When you have a developing economy and a rising personal income, you are then moving into discretionary spending to such a degree that you can begin pairing and choosing between unlike things. If you do this, not all--but maybe some of what Mr. Smolensky is concerned with would wash out.

Dr. Myers: I would like to ask Faith Clark a question about adequacy of diets.

As we read all the materials produced by the Department of Agriculture and see sometimes the rather small proportion of people who have sufficient income to purchase or spend, have sufficient spending to buy adequate diets, the small percentage that actually do, and I would like to ask her what research and what the future seems to hold for the possibilities of education. It seems like a weak tool perhaps for raising incomes, but I don't think we should neglect this problem.

Miss Clark: Do I get your point that you are concerned only because a small proportion of families are spending enough for adequate diets?

Dr. Myers: No. Of those who spend enough, 100 percent don't have an adequate diet. I was wondering, one, whether we know about the improvement of this knowledge and, two, what you think the possibilities of education are.

Miss Clark: Well, I think that the big improvements that we have seen over the years in the adequacy of diets have been at the lower end of the income scale, which does point out that more money results in better diets. The improvement at the higher end has to come from educational efforts. We work along these lines all the time. Much of it is a problem of food faddism and notions about food, at which we have to plug away. We hope that there is some progress here, but I think it is a harder thing really to get at perhaps than getting more food money to the families at the lower income levels.

The food stamp plan is proving to be quite an effective way of getting additional purchasing power to families. The evaluation studies that were done at the beginning of the program did show that with additional food money there was considerable improvement in diet.

At the higher end of the income scale, it is a matter of convincing people that there is something to nutrition and that all of us ought to do something about it.

I would like to go back if I may and direct a question to Mr. Smolensky and Mollie. He says he is going to leave the settling of what the exact poverty line is to us girls, and us girls don't really know very much about how to do it in any kind of objective way, or at least we haven't discovered any. Actually, I think we agree that the settling on what might be the poverty line is more or less a political decision, something that we as a nation do agree upon.

I am going to ask Mollie: Suppose in your arithmetic a couple of years ago when you started all of this on a poverty yardstick you had come out with something which was only, say, two thousand or twenty-five hundred for a family of four, instead of three thousand. Do you think actually it would make any difference? In your looking at the population mix and finding out who is below the line, wouldn't it come out just about the same? There would be plenty of people for OEO to work on, whether or not it was at two thousand or three thousand. It is always a relative matter, isn't it?

Miss Orshansky: I think that is true, Faith, if we remembered to taper, if we didn't say that two thousand dollars was for everybody. I believe that's right.

I think what Faith says is true. The only way I want to differ is, to beg out, I don't think that the three thousand dollars became the standard as a result of what SSA did. The CEA and the politicos in their infinite wisdom were looking around for a dividing line which would result in a target not so big that everybody would say, "Oh, go on; you're nuts," and not so small that everyone would say, "There's nothing to it." They could have picked under two thousand; they could have picked under four thousand; they did pick under three.

I would like to think that maybe the reason they chose under three was because some special tabulations were available on the characteristics. For these, of low income families, the Bureau of the Census had earlier settled on three thousand dollars partly because some of the government ladies said that that

might be better than some other cutoff. But once the CEA picked the dollar line they looked around for a rationale, and we just happened to have one. I would be willing to bet that maybe they would have picked three thousand dollars anyway, but whatever standard you pick, if you taper it for size, I think you would get more or less the same kind of population mix.

Mr. Smolensky: The thing that seems to wobble quite a little bit as a consequence of the definition is the proportion of aged versus the number of children.

Miss Orshansky: Yes, that's right.

Mr. Smolensky: I have another hobby-horse I would like to ride. Let's see if it's a good time to ride it. I really find it very hard to pay any attention to socio-economic characteristics that one derives from these kinds of tabulations. I don't like this idea at all. I would like to see aggregates mainly used because I think the proper policy response is really an aggregate one, and what I want is for us to get to full employment and stay there for five years and see if that doesn't wash away a lot of what we have or almost all of what we have.

I realize I am in an unpopular position, but I think that the thing to remember about these socio-economic characteristics is that they are very poor predicters of poverty. There is only one socio-economic characteristics apart from poverty itself for which the expected income, the median income, is less than three thousand dollars. That is, most non-whites are not poor. A vast majority of the non-whites are not poor; the vast majority of the aged are not poor.

You take the median income of those who have a disproportionate part of their population in poverty, and the median is far above three thousand dollars. You can get very close if you take non-farm, non-white, then you get very close to fifty percent being in poverty, but you need some kind of characteristic like that.

The predicter that does get into poverty, the one for which the expected income is far below three thousand dollars, is "less than an eighth grade education." Now, for those with less than an eighth grade education, there obviously is a hidden mix of poverty related characteristics because those who have less than an eighth grade recorded education--never mind eighth grade knowledge--less than an eighth grade recorded education must, generally speaking, be the aged or at least older people and migrants.

Now, if you took those all out--actually, I tried to take those people out, and I still find that less than an eighth grade education is the only indicator of poverty apart from poverty itself, and that's what leads me to the notion that we really don't know what causes poverty at all, but these socio-economic factors are certainly not causes.

I walk around, very dangerously, with sort of a virus theory of poverty in my head. I say I don't know what causes poverty just as I say I don't know what

causes a cold, but I know that you are more likely to get the disease if you are non-white or if you are a non-white farmer, but I don't know what causes the disease. Therefore, I am driven on the prescription side to think that since we don't know what causes the disease and we can't design a cure for a virus that we can't identify, then I want to hit with the broadest spectrum antibiotic I can find, and that is very rapid growth.

Dr. Myers: Mrs. Lamale?

Mrs. Lamale: What disturbs me about that is, that we are talking about an either/or kind of evaluation of the problem, and it isn't an either/or problem.

Mr. Smolensky: Yes, it is.

Mrs. Lamale: We should move on all fronts, and I think this is what Mollie and I were saying at an earlier date. The decision as to levels which would be at three thousand, twenty-five hundred, or thirty-five hundred has one set of significance if you are using it for aggregate evaluation, and so forth. It has quite a different set of significances if you are going to use it to describe what are the problem areas. Certainly, I think there is value in the use of a discriminant--whatever it is, a poverty level, a series of criteria on participation rates or envy motivations, or what-have-you--which distinguishes those groups in the population because, as I think it was brought out this morning, no matter how much you increase the employment, there are certain very important groups that never will be touched.

If we have full employment, it may make the rest of the groups able to provide better for those with lower incomes, but there is a sizable group in our population among those who have been called poor who will not benefit by straight growth.

Mr. Smolensky: There are 40 percent of the poor not on the labor force, and for that 40 percent of the poor who are not on the labor force and who we don't want to be, this aggregate description doesn't work.

Dr. Myers: We will now take questions from the audience. Would you please state to whom the question is addressed and say it as loudly as you can? Yes, sir?

Mr. Don M. Soule: Mr. Smolensky, what would this high rate of growth do for the man who is employed at $1.25 an hour, forty hours a week?

Mr. Smolensky: Raise it to $1.35 probably or more.

If you are asking how rapidly would incomes rise among the low income population, I think the answer is pretty clear. We have an historical precedent. We know what happened the last time we had five years of continuous growth and low unemployment levels, and that was during the Second World War. If you insist with me that you really will be very skeptical of any poverty line that doesn't rise with gross national product, then you are going to be insistent

with me that there isn't going to be any lessening of the poverty problem unless there is some reduction in income inequality.

We know from endless statistics and different kinds of income distribution measures what happened to distribution of income from 1941 to 1946 in the United States. Convergence was rapid; nowhere in the statistical records can we find anything like this kind of closing of distribution at any other time, and I should think that if we get that rate of improvement in the poverty problem now, we will all be out of our minds with joy.

Mr. Soule: I don't think you answered the question.

Mr. Smolensky: Well, if you want me to say at $1.26 or $1.36, how high that wage is going to rise, I can't give it to you. I can tell you that workers in hosiery mills in the South had more than a 50 percent rise in income in those five years.

Mrs. Lamale: Isn't that terribly low?

Mr. Smolensky: Well, of course, it is terribly low, but the 45 cents an hour or the 35 cents an hour that you started with as the base in 1939 is not significant now in terms of the kinds of shifting of wage rates.

Dr. Myers: This gentleman on the right, would you state your name and then the question?

Mr. John L. Koch: John Koch.

This can be discussed between Mollie and Faith. Some years ago, I sat on a panel with a number of welfare officials. This question came from the floor, and this one question particularly was one that I would like to throw to the two ladies.

This man here said that there were three families that had applied for relief and had received relief. One family came from a so-called above standard method of living; one was a standard; and one came from a below standard type of living; and, in a period of one year each receiving the same welfare allowance, the person who was from a below standard, so-called below standard manner of living had been able to save in a bank some $250, and the question he raised is one that I ask and that is:

How can we determine by incomes the type of budgets and the type of food allowances that should be given to any family, say, man, wife, and two children of the same age and who are in need of assistance?

Miss Clark: Are you raising the question of developing a budget to fit a particular family size and compositional group because, of course, the size of the food budget and the size of the total budget should be geared to fit the size and composition of the family?

Mr. Koch: You can use that as an example. He said that in each one of these cases that the family was of the same size.

Miss Clark: I see.

Mr. Koch: Man, wife, and two children of ages comparable to one another and that in giving this food allowance, which is a standard food allowance, that the family that they considered to be below standard in their living habits was able to save some $250 within that period of time.

Miss Clark: Well, some people eat more than others and there are, of course, variations in needs even within a given family size and composition that I suppose could account for some of it and some of the know-how of purchasing. I don't know what else, Mollie; do you have any other ideas?

Miss Orshansky: Well, I don't know. We do find sometimes in medicine and economics that people who have lived at sub-standard levels--either nutrition-wise, health-wise, or anything else--sometimes, such people are better able to weather a storm than a person who has been in better shape. That is, the acute crisis may hit someone harder who hasn't learned, the ropes or how to make-do. It's the only explanation I can think of, but I don't quite know if that's what the tenor of the question is.

When we give relief allowances we try to determine on an average for a given type of family what the requirements are and what its resources are, and see if we can make up at least part of the difference. But then we don't--and I think most of us wouldn't want to--go in to see just exactly what the family does with the money. Otherwise, following up on your story you would be penalizing somebody for being able to manage a little bit better than somebody else.

Those of us who are above the poverty line don't all spend our money equally efficiently, and I don't know why you should assume that those below would. We know that they have much more limited choice. With the lesser education that they have some of them will do far less well than we, although I am amazed at how much better some of them do than I think I could!

Mrs. Lamale: Since this isn't a public welfare group, I guess I can illustrate this point without embarrassing anybody. There is a famous case in New York City where an old gentleman who was ill in about 1940 and had been a financial investor and had lost his money applied for assistance and was granted the usual amount for public assistance. He was completely eligible at that point.

Over the years, he got what most people in New York thought was a meager amount, but he had a good suit of clothes which he carefully preserved; he lived in a room which had some hotplate facilities, and at the beginning of the week he bought some potatoes and meat and made himself a stew which lasted a week, and he bought some apples, and so he had a very limited diet. His one form of recreation was investing in the stock market, and, in 1954 or thereabouts, they discovered he had increased his holdings to $50,000. He was still living on

his assistance payments, but he had been living in a way that very few other Americans would have been willing to live, and his one form of recreation had been very profitable.

Of course, the question came up--was he guilty of defrauding the government? I think he was taken off the assistance rolls and asked to replace the funds that he was given after he became eligible. This was a situation where he was getting the average payment that had been developed from averages for large groups of families, but he was apparently willing to live at a scale that was less than the average. The concoction that he developed, while it was considerably lower than the economy food plan, was nutritionally adequate for him.

I think that this is the error of application in an average.

Dr. Myers: Another question? Yes, sir?

Mr. Bruno Stein:

What I am missing in this discussion is a definition--with the exception of Mr. Smolensky who has given us a definition of some unfortunate overtones, which operationally puts a premium on anti-social behavior. The ladies who were counting have not defined--they have given us some indices such as $3,000 with or without a sliding scale, and so forth--but I wonder if any of them have given any thought to defining the problem first and then attempting to make an account because it is clearly not an economic problem but a sociological one.

Mr. Smolensky: May I answer for the ladies?

I don't think I have unfortunate overtones in my definition, but I got to this definition of the problem by asking myself what I want my poverty line to do, and I think that's necessary. What you want to ask is what policy decisions are riding on this definition and then come up with a suitable definition.

I think what the conversation just before, among these two ladies, was that given the kinds of policy decisions we are making now, you don't have to do any better than the three thousand. I am suggesting that maybe we should be making better policy decisions, some that will have to answer questions which attempt to isolate sources of inefficiency.

Dr. Myers: Any other questions? Any other questions from the audience? Yes, sir?

Mr. Alfred M. Skolnik:

Purely statistics. I want to know what is being considered as a poverty line from year to year to provide a measurement as to how well the government programs are coming along. It sounds to me this is done every three or four years. Have we got anything in the material on that?

Miss Orshansky: We have controversy, which is always good. There is not an unanimity of opinion on whether or how one should change the poverty line. You can get a little more agreement, but not unanimity, among some that you should at least adjust for price change. This is reasonably simple.

Then you have people, for instance, like Robert Lampman who has done a great deal of work in this field who feels you shouldn't change your poverty line. You can adjust the prices, but otherwise keep it unvarying. In a way--although I don't agree with it--it is an easier position to take.

Mr. Smolensky: And hope the problem goes away?

Miss Orshansky: And hope the problem goes away. If you look at the figures for 1964 income, the number of persons with incomes below the poverty line is smaller than it was in 1963 even though the war on poverty wasn't started yet. So obviously if we did absolutely nothing but just sit still, in fifteen and a half years--no poverty. We don't believe this, so then the question is how should you relate gross national product to average earnings. Perhaps it would be even harder if we added government programs which gave the equivalent of services to low income families because then we would really have to put something in for this.

All I can say is people are thinking about it and working on it, but it is a question.

Dr. Myers: I think we will have to stop here except to say just a couple of words to summarize perhaps.

I think there is a great deal of agreement on the specialties. That is, the process of counting has made people find out the areas where the problems are; that is, it indicates what groups are disadvantaged and where remedial action should be taken.

One disadvantage these ladies have is since they work for the government, they can't come out and make policy speeches. Generally, they have to only indicate what should be remedied and how it should be done, but certainly the type of research which is going on on the measurement of the poor and discovering the characteristics of the poor regardless of the precise level at which the budget is set should certainly contribute to useful programs of attacking the problem of poverty in the United States.

COMMUNITY AND GOVERNMENT COOPERATION FOR
DISADVANTAGED GROUPS

(Application of Federal and State Research and Statistics in
the Administration of the Poverty Programs)

Mr. Keim: This is the session on "Community and Government Cooperation for Disadvantaged Groups." This panel has been meeting for an hour or more, and I understand that they have pretty well settled many of the serious policy problems of the economy and they are well prepared to come before you at this time.

Let me introduce and turn the meeting over to Mr. Raymond Male, the Chairman, Commissioner of the New Jersey Department of Labor and Industry, who really needs no introduction to our group.

Mr. Male: There is another report from Hyman Bookbinder, Assistant Director of the Office of Economic Opportunity (OEO). He is going to wear a different hat for the next few minutes and he is going to talk about OES's research program.

We are going to change our ground rules here, since he may have to leave for his plane sooner than we would like. Mr. Bookbinder would like to speak briefly and then open the floor to the audience for questions. Mr. Bookbinder.

The Office of Economic Opportunity Research Program

Hyman H. Bookbinder, Assistant Director
Office of Economic Opportunity

Let me just talk very briefly and in a nontechnical way to some extent, because I don't handle the research for the organization. We have a wonderful man Dr. Joseph Kershaw who looks after the more technical research work. However, I studied statistics and was a research director for many years, so you've got a friend here. More than that, I want to tell you with all the sincerity I can muster that everybody in this program that I know from Mr. Shriver down to the agencies and up to Mr. Humphrey who looks upon us from the outside, approves of the emphasis that is being placed today on the full utilization of all information that can be made available.

A significant percentage of our resources is going into this operation. As an indication, incidentally, we have now made the punchcard profession in Washington one of the tightest areas in the country. I am told that resulting from our program alone, some 2 million cards have been punched in the last 6 months. Anyway, we are going to have our own computer soon because there's lots of information that we are entering, the input is tremendous, and we hope that soon the output also will be pretty good.

For example, I told you about the 530,000 children who are going to Head Start. Well, obviously, as Mollie so eloquently suggested at the end of her talk, it's the youngsters that count, but we are going to do the counting, also, and we are going to use this as one, great, massive operation to tell us things about the children, about their backgrounds, about their parents, about what the program is doing for them, whether the 75,000 out of the 500,000 will get reading glasses. Just remember that little footnote. We expect that 75,000 out of the 500,000 will be found to need glasses.

In the normal course of events, among kids from this kind of a cultural background, maybe out of those 75,000, 5,000 might have been getting glasses. We want to know, what impact better reading ability has on reading skills. A lot of things like this can be examined.

We expect to follow these children, not by name, but by serial number. There are problems of confidentiality--with which you are not unfamiliar--but we shall watch out for things like that.

We are going to evaluate our programs. I have already indicated one research project we funded. We are going to fund a lot of groups, universities, research organizations, and local groups, to do this evaluation. We do not intend to duplicate or to replace the thousands of people throughout this country in the various disciplines who have for years been producing invaluable material as a guide to poverty programs.

Much information already is available from other agencies, private and public. What we intend to do in the research area is precisely what we intend to do in the action area. Two things: First, to help get the most out of existing programs. That goes for such regular action programs as HEW programs, U. S. Department of Labor programs, and Small Business programs. We shall try to get the most out of these programs focused on the problem of poverty. Secondly, we shall try to fill identified gaps with the money that we get from the Congress.

Both of these things apply to research as well as they do to action in the Proverty Program.

We are putting together an excellent group of some 30 to 40 people from the various disciplines to work right in OEO, in the Office of Research, Evaluation, Programs, and Planning. We expect to have in the Job Corps a research operation looking at the Job Corps particularly. In the Community Action Program, there are people looking at the Community Action Program.

Secondly, we recognize that there are many pieces of information and many programs available to communities which aren't being fully utilized today. One of the greatest wastes in this country today is information that isn't being used intelligently.

For example, Federal action programs are available to people, organizations and communities that need them most, but lack information and knowledge about such programs. Now, you will find some compendia of programs: HEW has one, ARA has one, the U. S. Department of Commerce has one; they are useful, but we intend

to have a compendium of compendiums before we are through. We intend to take every government program that has an impact on poverty and put the whole information together in a useful way so that groups in every Community Action Program can use it, so that private organizations seeking to combine items and develop an intelligent, rounded program on poverty have something to refer to.

The first draft is a pretty thick book. It is not just intended as a listing, but as an intelligent compilation. This is a very fundamental thing. You do not have to be very sophisticated to know that you need such a compendium. We don't have one today in a good enough form, but it is our intention that we shall.

It is important that we do it, for in many respects, one of the really most significant things we are doing in the Poverty Program is to get people involved in it who never before have been involved in social operations and social organizations. The phrase is "the involvement of the poor." There are problems in that and difficulties; but there is also great promise in this concept of involving new people, for they especially are going to need tools, information, but drafted in such a way, formed in such a way that it is useful to them. One of our jobs is to transmit information and knowledge to people so they may become more effectively involved in this War.

There are many questions for which we have to find answers. Some of the answers are available now in Ph.D. theses, some of them are available in esoteric studies that nobody knows about, and much will have to be done anew. We intend to help get the answers. For example, we have been trying to teach adults for a long time, yet, nobody in this country is satisfied that we really know how to teach adults.

We talk about job requirements, job information. Well, the Ewan Clagues of this country are going to solve that problem. They already have solved parts of it. We hope we will not do it arrogantly, but we are going to raise the questions because we will know perhaps more -- by "we," I mean the whole Poverty Program; I don't mean just OEO. We are going to have identified to us in thousands of communities, in hundreds of Job Corps camps, just what the gaps in information are, and if we can find answers through one of your activities or private research groups, fine. If we can't, we may have to do it ourselves.

Finally, we are interested, of course, in the statistics of poverty. However, sometimes I wonder whether we really are and should be. I heard the last part of your discussion. It was interesting, but I can't say I am excited by that kind of discussion. What difference does it really make? I think Mollie was suggesting this: What difference does it really make if we decide that we count only those under 2,500 or under 3,000 or under 4,000? What difference does it really make how we think we are going to count it 5 years from now?

When you are dealing with 36 million people under that level -- and we ta-talked about $3,100, $3,000 -- the important thing is that we have been alerted. We know there are things that have to be done. The idea is to start these programs and reach as many people as possible, and if you help a family with a $4,000 income to get into a $6,000 class, so what? I'm not going to worry about that.

The important thing is that the programs are really designed for the $1,000, $2,000 and $3,000 income families.

This sounds like anti-statistics. I close by just reminding you that while we sometimes ignore statistics and even ridicule its importance, the fact is th-that statistics started this War on Poverty. It was a few statistical studies that got Jack Kennedy to say, "I don't believe that we have to have a country with so many kids being rejected by Selective Service or so many kids in poor families." These aggregate statistics have meaning, but we also must get the other kind, the individual data.

I'm ready for your questions.

From the Floor: I was just wondering if you could give any clues as to the kinds of research in Community Action Programs that you are more interested in. Are there possibilities that you see of using psychologists in learning studies, are there possibilities of using educational people in less exact kinds of study?

Mr. Bookbinder: I happen to have here a very brief release on a research grant made last week to the Bank Street College of Education in New York, a grant of $151,000 to conduct an intensive analysis of programs training teachers to deal with poverty-stricken children. Of course, this is an evaluation of programs that teach training for this work. There are organizations doing it; there are training programs. This grant is for the purpose of evaluating all of these approaches to tell us which seem to be the best. That's one illustration of a grant.

Let me tell you a little bit more about the North Carolina fund that I mentioned earlier today. This fund is for in-depth research surveys to evaluate and improve several types of current Anti-Poverty Programs. One study, which is focused on 11 North Carolina communities with existing CAP organizations, will closely examine local leadership, the types of problems which concern the community, and the way the residents deal with these problems.

By the way, I said something about the difficulties in the involvement of the poor. We have got to learn more about this. The objective is clear; the intent is serious, but we have to know how to involve them.

Did any of you hear about the Philadelphia elections of a month ago, the elections of the poor? Well, some of my colleagues have said they are delighted with the results. I am not. I say this frankly, that in an area of 500,000 potential voters in this election, 13,000 voted, and I'm not satisfied. I think we ought to be ready to fund a grant for this thing, or do something, to find out why with all the publicity, all of the attention, did only 13,000 turn out. I think we can learn a lot in that kind of an inquiry about how you reach the poor; what the problems are; whether it is fear, whether it is embarrassment, whether it is just illiteracy that kept them away from the polls. I think we have to know more than we know now about the reasons for this kind of turnout.

Mr. Sidney Hatkin: This War on Poverty can go on continuously; it can improve conditions until we might reach what we consider Utopia. Under what circumstances would you consider this War on Poverty to be off to a very good start and where we might be winning the War on Poverty?

Mr. Bookbinder: Well, this is really more for a philosophy class, in a sense. I don't really know. I do know that for as many years as I shall be around, I don't have to worry about that problem. Certainly, for the next 5 or 10 years, we don't have to worry about it.

I think there are ways of measuring success that go beyond looking at the distribution of income and seeing how many million families are out of poverty. That's one way, and some people will do that inevitably.

I think it is enough to know that so many hundred thousand fewer youngsters have dropped out of high school in the next 10 years than in the last 10 years. To know that so many kids who were in the obvious target area have now moved out of it; that so many mothers are now doing half-time work; that in this first year alone we have put about 100,000 poor people to work as staff participants in the War Against Poverty, giving them not only an income, but that important sense of participation that they are "government" workers, that they are working on behalf of other people. I think we are going to have to be satisfied for quite a number of years to measure our success that way, rather than in this straight macro way or so many million people out of poverty.

From the Floor: There must be some correlation between domestic efforts against poverty and the overall aid program. Would you outline some of those interrelationships? I mean foreign aid. I wonder whether there is anything we can learn that has an overseas application.

Mr. Bookbinder: Well, there are some things; I am glad you said that. Israel, for example, has invited some of us to come and take a look at some of their training programs, their own Job Corps programs. Certainly, there are some things we can learn from this, but there are other kinds of relationships that are less tangible than that, I suppose, or less direct.

First, politically, I think the American people are able now to say, "Well, we poured billions of dollars to help the poor overseas; it's about time we are doing it for our own people." There's that kind of relationship, but there is another kind that I think is more significant. Every now and then somebody gets up very knowledgeably and arrogantly, too, and says, "Now, what do you mean "poor," three thousand dollars; why, the average family in India has an income of $200; or in Brazil, so much." We need to do a great education job along the lines I hope I was doing 2 or 3 minutes ago, that poverty isn't measured that way; that when you are in a society like ours where the average person has an income of about $7,000, the poverty of the family with a $2,000 income is more onerous, more difficult, more depressing, than the poverty of the Indian family in the midst of general poverty. He hasn't got that feeling of his having been left out; so, there isn't too much relationship really as to the nature of poverty in our case and in most cases overseas, but politically there is some connection.

A Voice: Supposing you said most people who are poor today have been poor since they were born; their children were born in poor families; they themselves are poor. Now, we stand off as statisticians and say they are poor people, but do they feel they are poor people, and are they interested in being anything else other than poor people?

Mr. Bookbinder: Well, I think that is one of the myths -- that most poor people don't even realize they are poor, don't care about being poor. There obviously must be some people like that, but we already have indications that they don't want to remain that way.

I talked about the 300,000 young people who want to be in the Job Corps. You have no trouble getting youngsters to apply for the Neighborhood Youth Corps jobs. Have you had any difficulty? I doubt that you will have any difficulty. All of these programs are available, and they are being used. I commented on the failure of some people to vote, but I don't think that goes to the heart of your question.

It is just a myth that people don't mind being poor. It's not unrelated to the civil rights question. Many people argued, of course, and some still do that troublemakers got the Negroes unhappy; they were very happy until some people told them they were unhappy; and that they never really minded being treated the way they were, but that's also obviously a falsehood, just not accurate.

There is a very important relationship between the civil rights problem and the poverty problem, and I would like to end on that note. The President made, I think perhaps, his most important speech of his career at Howard University about 10 days ago in which he made this very significant analysis of the relationship between discrimination and poverty. As he said, while we have made remarkable gains -- not finished yet -- we have opened up the doors to opportunity in many ways, legally, through legislation, through executive action, through private action, the time has now come to make it possible for people to walk through those doors. Until they can walk through those doors, the fact of open doors isn't going to solve their problems.

It is only through programs like the ones we are involved in now, that we can improve the living conditions of the poor. In many ways, the Negro problem, the minority problem, is the same as the poverty problem. Don't for a moment think that the two are identical in terms of size, because three-quarters -- I think that's the figure -- of all poor people are white people simply because approximately 90 percent of the U. S. population is white. While the percentage is much greater among Negroes, there are plenty of poor white people, too.

Well, I think I have made enough random observations. Thank you very much.

Projected Research on Levels and Standards of Living

Arnold E. Chase, Assistant Commissioner for
Prices and Living Conditions
Bureau of Labor Statistics
U. S. Department of Labor

There are some questions that I think we need to ask ourselves about our social and cultural goals. We now are able to meet the basis needs of most of our families and still have from a third to a half of our income to spend in more or less of a discretionary way. This segment must expand if we are to maintain a growing economy. I don't think that many of us know how to evaluate this segment of our consumption, our social and cultural activities in the broadest sense, including education, training, and retraining and the services of public officials.

I'm not saying that we have to expand public employment as a means of maintaining a growing economy, but there are many other kinds of activities in the private sphere that fall in this broad, general category of social and cultural activity. It is of great importance for us to be giving some thought and study to the evaluation of this aspect of our national life and the setting of our national goals.

We should now begin thinking about this business of allocation of consumer expenditure. We were not thinking just about the disadvantaged groups at the inception of the Poverty Program. We drew up a comprehensive program of study, called "Living Condition Studies," which we had hoped would be implemented at sometime. We haven't been able to get very far with this, but I think that many of you may have the opportunity to proceed with this kind of analysis of our society and by doing so will provide the leadership that is needed in local communities. I don't think this is the kind of activity that the Federal government can do alone. I think it is a matter of community interest and leadership of our community institutions.

So I would like to suggest that we should think of this in broader terms than just in terms of the disadvantaged groups, primarily for the benefit of the economy as a whole.

We have absorbed a great deal of statistics. This being a statistics group we are bound to spend much time talking about statistics, but our Secretary of Labor keeps reminding us that people are not statistics, that they are more than statistics. Much of the program that we have developed recently is an attempt to suggest ways of evaluating, through statistical analysis, our progress in alleviating or eliminating poverty. I will make no apology for the analytical approach before this group and, in fact, many authorities readily admit to a further expansion of the mathematical approach in the social sciences.

Dr. George Stigler, past-President of the American Economic Association, said in one of his essays that by the year 2002-03 -- notice the precision -- not the year 2000, but the year 2002-03, that the science of economics will be entirely mathematical.

Can you imagine picking up the President's Economic Report and from the first to the last page you have nothing but mathematical formulas and statistical tables?

He may have exaggerated a little, but at any rate there is a need to quantify as many of these social and cultural aspects of our society as possible. That is what is involved in all of the discussion that has been going on here. Everyone knows that statistics will not solve the problem of poverty or the question of economic growth, but we use statistics to quantify the problem, to identify it and to suggest alternative approaches. Thus, we think more and more in terms of statistical-analytical programs.

I was glad to hear Mr. Bookbinder say one of the things they plan to do is to make much greater use of the existing statistics. We all know there are many statistics in the public assistance records, in the unemployment compensation records, in the OASDI records, and in many other places, that are not being used now.

I am not going to spend much time on the need for establishing standards; it was discussed at length in the earlier panel this afternoon. Mr. Bookbinder said a few minutes ago that he thought we had adequate information on this. There are some of us in government who question whether it is unimportant that a family with a $4,000 income might have its income raised to $6,000 through poverty program assistance. If this happens in a few families, it isn't terribly important from a social point of view; but the political facts of life are that if anyone opposed to this program can find examples of this kind, he will make the program look much worse.

What concerns the statisticians about this question is that when that time comes, there will be a very great drive to have something better in a hurry. This has happened so often that it worries us, so that our emphasis now on doing a more precise job is to try to avoid having this kind of pressure placed on us at a later time. We urge looking forward to the need for establishing much more precise standards for defining poverty, and the "poor," than are available now.

When this comes to the local community, the problem is even greater than at the national level, where we can deal more in aggregates -- especially when you begin to get criticism about the eligibility of certain families for participation in a given program.

There are two other aspects of the need for information about the problem of poverty, who is poor, and the causes and effects of poverty, which I think need mentioning here. One of them is that too much emphasis is being given to the income of families, and to their assets or levels of consumption. Poverty is much more than this, as Mr. Bookbinder mentioned in his remarks a few minutes ago. Because poverty is much more than a matter of inadequate income, it is going to be difficult to reach many of the poor families.

The programs that are now in operation, I feel sure, will not reach a fairly considerable segment of the total number of poor families. Those responsible for the programs may find that the enemy in the War on Poverty is fully as elusive

as the enemy in Viet Nam, because many of these poor families will not come forward and participate in the programs voluntarily.

It will be necessary to get information to understand the attitudes and the motivation of these people so that we can devise ways of reaching them, and once they have been helped out of poverty, to find out if we can learn from the causes of poverty how to keep them out of poverty.

This is more than just having a job. A man may get a job, and he may be above the poverty line for a while; but if there is a downturn in the economy and he becomes unemployed, it will be easy for him to slip back into the attitudes that he had before he got out of poverty. That's one aspect.

Another important aspect is that a control group is needed. The Job Corps, for example, has taken a certain number of young men and is training them, giving them jobs, and re-educating them in many instances. Their progress will be followed -- according to Mr. Bookbinder -- to find out whether they get jobs and how long they hold them. Maybe not all those young men were lost to the economy in the first place. Perhaps a fairly significant percentage of them would have gotten back into the mainstream of the economy without having this kind of help. We need to find out, if we are going to measure the effects of the Anti-Poverty Programs, how the job experience of these people is different from that of their counterparts without this job experience.

There have been several programs proposed in this connection. There is one that I know of only vaguely. I think it is probably the broadest proposal that has been advanced so far. Herman Miller is working with the Census Bureau, I understand to have a fairly large-scale survey of households or families made in an attempt to find out their income and their family characteristics and to follow these people from time to time. Longitudinal surveys are needed, and This sounds like an excellent idea, provided that it is implemented and followed through.

We have suggested that we need to have surveys of consumer expenditures and income on a more or less continuous basis so that we can cover not only the population in general, but supply from a panel as a part of the survey the longitudinal kind of figures needed to determine the dynamics of poverty, who gets out of poverty, and who falls back into poverty; what these people's characteristics are, and how these characteristics affect their getting out of poverty or their falling back into poverty.

Well, Mr. Chairman, I have sketched these suggestions very briefly, but I would like to close by saying again that we don't think statistics will solve the poverty problem, but they will help to quantify and identify the problem in sufficient detail so that programs can be designed which are not yet devised. Then progress can be measured and we will have a better basis for knowing whether new programs of specific kinds are needed.

The West Virginia Appalachia Program

Richard H. Slavin, Area Director
Appalachian Center
West Virginia University

At West Virginia University, the War on Poverty started 3 years ago when Paul A. Miller, a West Virginian, became president of the University. He introduced a new concept in land-grant education by creating an organization dedicated primarily to the development of West Virginia. This new organization, "The West Virginia Center for Appalachian Studies and Development," is a unique, dramatic and yet highly practical dedication of the University to public service. The Appalachian Center is rooted in every school and college and every division and department of the University. In other words, President Miller mobilized the entire University for involvement in the specific problems and opportunities of West Virginia and of Appalachia.

One of the concepts that came out of this development was the "data bank." Obviously, a State, a region, or a local community in the modern day world is an extremely complex mixture of political, social, and economic forces. State and local governmental agencies, industrial developers, planning organizations, and private businesses will be successful only to the extent that their final product reflects a knowledge of these forces. The degree of analysis depends on the sophistication of the available data.

In West Virginia, researchers recognized existing shortcomings in the available supply of State, regional, and local statistics. Until remedial action is taken, important decisions concerning the growth of West Virginia industries, the development of comprehensive community planning, and the prosperity of its citizens will continue to be made on the basis of inadequate, inaccurate, and incomplete statistical data.

Also, during the past few years, two developments have caused State and local governments, like businesses, to become increasingly interested in improving their data-processing operations: first, rapid growth in the activities of these governmental units requires the handling of expanding volumes of data; and second, major technological advances have been made in data-processing equipment.

For the past decade, the professionals have suggested that the "computer revolution" is upon us. We have all been warned, moreover, of the dramatic effects to be expected of this revolution, not only in clerical activities but, increasingly, in the managerial realm. The impact of the computer in the Federal Government and industry is well documented, but there has been a dearth of information on computer applications in State government.

Unfortunately, data systems in West Virginia have exhibited a lack of conformity, coordination, and cooperation. With few exceptions, expensive duplication and costly competition have been commonplace in the development of the tools so necessary for processing the mounting load of paperwork and data. Within the rapidly advancing science of cybernetics, the State of West Virginia

has been caught up in the backwash of technological development and now, as many other State governments, is coming to a direct confrontation with the complex, fast paced field of automatic data processing.

Thus, State government has witnessed piecemeal computer development; applications in various departments have grown up unrelated to one another. There is very little compatibility to permit information from one department's files to be readilyfed to another department. These failings mean duplication in the use and storage of data, and less than maximum benefit from the State's data processing resources.

Concurrently, there has been a remarkable development in cheaper and more powerful hardware. For the first time, it is now possible to have extremely rapid access to all relevant data necessary for control in a large organization. New communications equipment developed by the telephone companies makes remote input and output possible: for example, an engineer 100 miles away from a computer can send in problems over telephone wire, and have the computer return the answer within seconds. Bell Telephone has developed systems that use telephone connections at night to send and receive data.

Keeping pace with this development in hardware has been an equally striking development in software. For example, "COBOL" (Common Business Oriented Language) is a common programming language for business applications, which closely approximates ordinary English. In addition, all manufacturers maintain libraries of "canned" computer programs, which a State may use with little or no modification , at tremendous cost savings.

Interchange of knowledge among States is another way to hasten efficient computer applications. Today, when a State wishes to computerize a particular application, it will often visit centers in one or two other States which it knows to have progressed in this area. A more formal system should be establi specifically to facilitate this interchange. This is one area where the State's Department of Labor Statistics can play a major role. This interchange could also incorporate the counterpart agencies at the local and Federal level, since in many cases, their operations have a very important effect on State agency procedures. Standardization of data elements and codes among State agencies and their counterparts at the Federal and local level could prove of enormous value in data interchange.

Researchers also realize that the cost both in time and money of using secondary data can be reduced if a single agency were available to do statistical work now carried on independently with considerable duplication by different ivate and public organizations within the State. One realistic solution to some of these problems has to be the establishment of an area or State data service commonly known as a "data bank."

The general purpose of this proposed data bank would be to provide systematic current data on pertinent economic and social activities and other significant phenomena in West Virginia as a central service to business firms and public agencies in the State. Here are some examples of the data that we hope might be made available for sounc and knowledgeable decision making by organizations in planning their future programs: data on change in population size and

composition, personal and family income, agricultural and mineral production, residential and other construction, consumer expenditure and employment, and other statistical series widely used by firms or agencies. Of course, a data bank can be used for many other areas or objectives.

To be effective, the data bank would be concerned with correcting weaknesses in the present information base. For example, uniform standards and definitions would have to be developed for use by data collectors. The ultimate objective would be to obtain agreement throughout the State on the procedures to be used in obtaining a body of data of generally recognized value. Thus, one objective of the data bank would be to strive to have the data collected in a manner that would make the greatest possible contribution to improving the State information base. Another objective would be to facilitate the more economical use of existing data. This could be accomplished by centralizing, and thus reducing, the cost of performing data-oriented tasks now being carried out with unnecessary duplication by a number of firms and agencies.

The data bank would give technical assistance to collecting agencies when such action is consistent with the goals of improving the information base. Intercensus estimates of population, housing, income, and other key variables could be made available and a program designed to make census data and census operations more useful to the community. The development of a publication program that would disseminate this statistical data economically would also be of great service, but these services are in the future.

Although future costs and benefits can only be estimated, the savings associated with the availability of better data and the centralized performance of data-related activities appears to be greater than the expenses that would be incurred in operating the proposed data bank and improving the stock of secondary data.

At first glance, it would seem that the growth of the data bank concept must mean the development of centralization. This is not necessarily so, however. There are obstacles in the path of computer centralization, primarily the existence of computer organization in the various agencies. I am sure some compromise will be reached so that it will be possible for the information in several computers to be accessible to all other computers.

Premature centralization of data-processing equipment (total or partial), prior to completion of a detailed analysis of the opportunities and problems, could result in the disruption and impairment of State governmental services.

Additionally, and what is perhaps more serious, experienced administrators are often reluctant to learn the rules of EDP control, and may be unable to detect misuse or to direct younger administrators who acquire expertise in the new technology.

Also, circumstances peculiar to State and local government need to be recognized by the EDP specialists -- involving areas which are materially different from those found in private industrial organizations. In my experience, most departments do not see the full value of electronic data processing, except

as it might apply to specific operations. This failure is due to a basic weakness, in this field, of many public administrators. The majority of department heads are unaware of the many areas in which they need data for making major policy decisions. This lack of awareness is the main reason why such facts are not available to them under their present system.

Unless the State and local government executive can be convinced of the need for facts in making policy decisions, we cannot expect him to be enthusiastic about equipment that can produce facts. The potentials are there, if we only apply ourselves jointly to their solution.

Mr. Male: The next topic is "Community Action in Hartford." John McLean is Director of the Community Renewal Team which is, I believe, in the greater Hartford area. He will talk to you about some of the data needs at an important level in the War on Poverty, at the constituent level where you meet the poor eyeball-to-eyeball -- not on charts and not in Congressional committees.

Community Action in Hartford

John McLean, Director
Community Renewal Team
Hartford, Connecticut

The use of data in a Community Action Program of the Poverty Program gets down to three things: what you are going to do, what you are doing, and whether it was a good idea to have done it.

Of those three, I suspect that most of the communities in the Nation are most concerned with what they are going to do and, particularly, how to prove to Mr. Bookbinder and others in his shop that it might be worth doing.

I would like to side with those who say that poverty statistics go a long way beyond level of income. To the extent that eligibility for the Poverty Program may begin at levels of income prevalent through large communities, cities, counties, States, and so forth, we have a rather strange situation. Taken on a flat income basis, presence of elderly persons in a family would qualify you to conduct programs for the young, who may be unqualified because in our so-called poverty areas the latter tend to be grouped in very large families where welfare payments alone may put them above the poverty level.

This has not actually happened so far. It is what could happen if we are held too tightly to a flat-income basis. I can best illustrat this by telling you a little of our experience as we prepared the first statistics to support a Community Action Program.

The obvious source for most statistics, a beginning source, is the United States Census. It gave us certain problems. Constitution Plaza, which some of you have seen in Hartford is universally heralded as a national model of physical urban renewal. If any of the various bank presidents whose offices are there would like to call that their domicile, eventually, then their children

could attend Poverty Programs because as of the time of the 1960 census, that was a beautiful example of a poverty area. It no longer exists.

Another poverty area in Hartford has been completely torn down and is being replaced with luxury apartments, probably aimed at people without children. As long as the 1960 census is taken as a guide, that still would be a lovely poverty area. In every metropolitan community, poverty moves around all the time. Therefore, we would have some problems using the 1960 census if that were all that we used.

Another problem is that while the census may tell you whether there are people poor enough to justify a program, it won't tell you a great deal about what kind of program to have.

Some of the more unusual figures that we used came from sources other than the census. We were particularly delighted that our submission followed by about 1 month the development of a manpower monograph on Hartford by the State Labor Department. Dave Pinsky, the Labor Department's Research Director, made a significant contribution to the Hartford Community Action Program via this approach. Of the 40 tables that we included, I think at least 10 of them relied on material State Labor Department's monograph.

Welfare statistics begin to show how, in a well-to-do metropolitan area such as ours, poverty will tend to cluster in the core city and then within particular areas of the core city. Sophisticated break-downs of welfare statistics show the number of people on welfare rolls who are deemed to be employable. The figures, by race and length of time in the community, gave us some idea of the extent to which poverty was a factor of in-migration and the extent to which we perpetuate the farmer in Hartford.

Some of the most interesting figures we found ourselves using were statistics on unwed mothers. An exhaustive study by the Hartford City Health Department showed something that not too many people have observed elsewhere, although there is no reason to believe it does not exist in every community of the country. The study showed that in 1950 4 percent of the children born in the City of Hartford were illegitimate; by 1963 the figure was 13 or 14 percent, and in some of the census tracts within our target areas, it was up to 25 and 30 percent.

Judging by flat income per family, a family with six illegitimate children is not likely to be poor if the State happens to have a reasonably generous welfare program. However, getting at the real causes of poverty, certainly sociologists and many others would agree that certain circumstances, such as children born into a family where no work is performed, into families where no father is present, and where the family is grouped together in sub-standard housing, all contribute to the so-called "cycle of poverty."

Perhaps the most important statistics is that comparing educational achievement among different neighborhood schools. Here, I think, you begin to get the basis for your educational and post-educational programming, in Community Action and free education programs. In one sense, defining education very

broadly, most of the proverty program is education. Either it is adult job training, perhaps to make up for deficiencies in schooling, or it is a program like Head Start or our year around child development day care, and homemaker-teacher programs, which focus on preparing children for school.

In Hartford, the gap at grade 2 in reading achievement between the six lowest and six highest schools placed the latter schools a year and a half ahead of the former group; in the 6th grade there was a gap of 3 years.

Now, if a child is behind other children in the same city 3 years at the 6th grade level, we all know what his chances are of competing economically when he gets beyond school.

The finest anti-dropout program might keep him off the streets during high school, but he has already given up a very precious competitive factor toward getting work later. As a result of this, we are now, in our latest submission to the Poverty Program, proposing extension of target areas on the basis of educational achievement, for several reasons.

One is, of course, that we can obtain much more up-to-date figures from the school system, which runs national tests every year, than from the 1960 census figures. Secondly is the close correlation between educational achievement and all the other poverty indices. The fact that this correlation not only tells you something about where you have a poverty potential if the children are not poor already, but also tells you where you want to put programs aimed at increasing the children's capabilities. Of course, the whole purpose of the Poverty Program is to increase the people's capabilities. We have many data needs, some basic to program management. You have to know how many Neighborhood Youth Corps kids you have at the moment, otherwise you wouldn't know whether you were still recruiting or whether you were turning people away. You have to know who those kids are--what neighborhoods they come from, and you have to know something of their educational experience. We do not test Neighborhood Youth Corps kids at the time they come into the program, because part of the advertisement to them is that they can get in without tests. We have kids with police records, and we do not pay any attention to their educational background; however, we test them as they go on, as a way of knowing which of them has the potential to move to more advanced training, and so forth.

Evaluation is a complicated subject, one which I cannot examine closely at this time because we are just arriving at this stage. Even this week our key committee meets to discuss progress on our evaluation plan. I will say that it involves the University of Connecticut. Many sessions have been held to try to figure out which of the things you wish to know can be quantified and which cannot.

We know that with 1,060 children scheduled in our Project Head Start, given that kind of universe, a lot of things can be quantified such as have been mentioned here by previous speakers. It's a broad enough universe for almost any kind of research.

In a program for unwed mothers, with 40 people in it, there is not going to be a research universe as such that amounts to very much. If you accept the standard that 50 is all right, but 35 is a little small, the sum of your evaluation must be purely subjective, in a situation where independent, professional opinion is to say how well a program did compared to how well it might have done. However, there will be a great demand, as every speaker here has said, to quantify everything that we can. We will need to stretch our imaginations to arrive at meaningful conclusions.

I think our neighborhood workers will throw up their hands and say, "I've got to get all these numbers for all these people; it's hard enough to get in the door, as it is, without trying to come up with quantified social tables."

We are a large Nation; we are going to need many statistics; and I know those of us who are basically involved in action programs must continually seek out more sophisticated approaches to the War on Poverty.

Research Services for Community Action

Herbert Bienstock, Regional Director
New York Regional Office
Bureau of Labor Statistics, U. S. Department of Labor

The information contained in your handout, "Some Uses of Statistics for Action Programs," is census material reinforced with current statistics from the Bureau of Labor Statistics, some of which was in connection with the youth program in New York City. We helped the New York City Youth Board work up some census data which resulted in a figure of about 72,200 out-of-school, out-of-work youngsters in New York City.

This is where the danger began. For about 5 straight years, everybody who made a speech in New York City about out-of-school, out-of-work youth said, "And today there are 72,200 out-of-school, out-of-work youth in the City of New York." After a while, no one really cared very much, because obviously this wasn't a developing problem--there wasn't any increase in the out-of school, out-of-work youth.

Other information proved quite useful, also. I call your attention to page 4, where there's a little front cover called "The Facts of Poverty in New York City" and some sample tables from a presentation that was made on that subject. The two columns in the center relate to the 400 of the 2,000 neighborhoods in New York that house 20 percent of the city's total population--the lowest 20 percent in terms of income. The population of these neighborhoods is 42 percent white, 21 percent Puerto Rican, and 36 percent Negro.

Now, look at the column on the right, the other 80 percent, a real tale of two cities. The other 80 percent of the population is 93 percent white, only 4 percent Negro, and 2 percent Puerto Rican.

While these data are 5 years old, basically the kind of relationships that develop or that have motivational value in terms of leadership for community

action are the same. You know, the statistician has always had the problem of how to get across to the policymakers the meaning of statistics, and now we are dealing with an entirely different group of policymakers. Community Action people are not people accustomed to dealing with data, but I want to call attention to the challenge that the statistician is faced with in this connection--to bring some meaning to the statistics, to seek out the patterns. After all, we are most qualified to do that perhaps, and in connection with Community Action and other programs, there is going to be a tremendous need for information that motivates people and, of course, information for program evaluation, but I am not dealing with that.

I was asked to talk at the Regional Plan Association, last November 9th, on the job picture in New York and northeastern New Jersey. We had a real slowing up in growth in the New York area over the 5-year period, 1958 to 1963. Out of every 100 new jobs nationally, we had only 1 in the New York-northeastern New Jersey area; prior to that period we accounded for about 1 out of every 10.

Most of us in the audience that day agreed that these figures were significant because, while poverty and unemployment are not synonymous, certainly unemployment is one aspect of poverty.

However, the data as presented roused little local interest, so we reworked it into the report you see here, Regional Report, Number 3. Basically, it contains information on structures, trends, and the like. This report provided the desired stimulus. The Chamber of Commerce, and the Commerce and Industry Association appointed a group of fourteen top industrial people who decided that perhaps New York needed to pay a little attention to industrial development. You will see that H. C. Turner of the Commerce and Industry Association attributes industry's support and enthusiasm in part to the recent report by the U. S. Department of Labor's Bureau of Labor Statistics which brought to light much of the relevant data.

"Profile Ninety," which is simply another regrouping of the census tract material, has had use and application in some of the job development programs in New York City; and Bob Johnson recalls that he sent these data to his people around the country with some suggestions as to how they might use similar local material.

Broad data on consumer spending which are not developed for specific purposes, can be useful for focusing attention. For example, families with an annual income of under three thousand dollars are spending 18 percent of their total consumption expenditure for things other than food, housing, and clothing. Incidentally, another 7 percent--although you can't see it here--went for medical care.

Census material, although it is 5 years old, does help to underscore some of the problems faced by a big city. In terms of occupational group distribution, 24 percent of the professional people and 30 percent of the managerial group who work in New York City do not live there, in contrast to the operatives, the semi-skilled workers, and laborers, about 94 or 95 percent of whom work and live in New York City.

The table on unemployment rates for non-white boys and girls shows us the kind of thing that people take for granted--that Negro youngsters have unemployment rates two or three times higher than white youngsters. But, if you look at these data, which come from our special labor force report, you will notice during the period 1948 to 1953 that the four sets of lines were relatively equal and in 1953 and beyond--actually more so beginning in 1957 when the shrinkage in the operative, the blue collar type of job began to set in--that's when you really get this spreading apart in the sense of unemployment rates for Negro and white youngsters.

Page ten presents data for social purposes that we have worked on in New York. I feel if we statisticians look at some of our products, we can find a lot in there that helps the policy people think. I guess that's our basic job in a way.

Mr. Male: Any questions?

From the floor: I have a question for Mr. McLean. What part does your agency play or what liaison do you have with the Hartford revitalization? Is that connected with your group at all?

Mr. McLean: We know of them, but we don't have any contract relationship.

Mr. W. T. Hughes: I would like to ask the panel, what method are you using to curtail drop-outs in your schools?

Mr. Bienstock: I think the panel members should answer that, especially Hy Bookbinder, because I can't think of a more effective method than the Operation Head Start; yet there isn't a school teacher in the country who won't tell you that you can identify a high school drop-out in the first or second grade because they have started a year or two behind, and particularly in terms of their reading ability. That's part of my answer to it.

Mr. Slavin: You are in a very good area. I think this is one of the great advantages of the Economic Opportunity Program because right now in West Virginia there is a tremendous battle developing over what we call "vocational education," and we have the Department of Education, the teacher's colleges, and so forth to hear on this issue.

In terms of the future and the occupations of the future, we haven't faced up to this at all, and I think that the OEO programs are going to bring this to a head much faster. We personally feel that there is going to have to be a significant change in this area of vocational education.

Mr. McLean: In Hartford we now have 269 in-school youth in our Neighborhood Youth Corps receiving $1.25 an hour for up to 14 hours a week. Certainly, this is effective in discouraging youth from leaving school for purely financial reasons, because they are making money while they are in school right there.

Then we have another 100, which I believe will be 200 this fall, in a program in which they go a half day to school and work in companies a half-day.

The companies pay the bill; all we do there is help somewhat in staffing the program.

Mr. Slavin: This type of program puts the economic incentive on staying in school, but all of the educational considerations still have to be met. Certainly, the Neighborhood Youth Corps is one of the strongest parts of the whole Poverty Program.

Mr. Hughes: In Oklahoma we don't have much trouble with drop-outs. We in the Department of Labor don't enforce the school attendance law, but we aid in its enforcement by requiring every boy or girl who works and who has not graduated from high school to have a certificate issued through my office. Then the employer violates the law and not the parent or the child.

When the parent signs an application for a child to work, that certificate is issued through the high school, and the hours of work must be shown on it. They must not conflict with the hours of school work, and the employer must have the certificate on file when my inspectors check his establishment.

We don't enforce the law, as I said; but, the fact that children must have that employment certificate before they work keeps the boy or girl in school, because the high school won't approve anything that conflicts with school hours.

A similar certificate is necessary to work during vacation time, so we don't have much trouble with drop-outs.

Mr. Male: I thank Mr. Bookbinder for putting the emphasis first on the evaluation of what they are doing, not only so they will be able to account for the money they are investing in the Poverty Program, but so that we can make changes in direction as those seem indicated, and for his pledge, secondly, that he hoped there would be no duplication of existing facilities. I would hate to see the poverty fighters at any level trying to duplicate or triplicate or go beyond the work being done by the Clagues and all of the agencies of government.

Mr. Chase reminded us of the need for longitudinal surveys. Certainly, this has become increasingly important to us. I hope that you will keep reminding us of it, as well as your call for the continuing census. I shortened that down to a two-word thing, but in the era of the computer, I see no reason why it cannot keep more than decennial check on where we are once every bit of our lives--at least our earning lives--is reported to Baltimore for social security and we have all been numbered.

Mr. Slavin reminded us and I think it is important for this audience, to think of the crucial role of our universities, and particularly of our state universities, in the research and statistics picture, not only in poverty but in all these great human interest areas of government.

Mr. McLean underscored, and underscored again, the human side of this business. I see nothing inconsistent in being concerned about the numbers and the data bits, while at the same time remembering that many of them represent something much more important, the bits and pieces of humanity that are our civilization.

CURRENT ECONOMIC SITUATION AND OUTLOOK--SYMPOSIUM

Chairman: David Pinsky, Director
Research and Information
Bureau of Labor Statistics
Connecticut Labor Department

CHAIRMAN PINSKY: The conferees have done a wonderful job, as you will see particularly this afternoon when we have a roundtable on developments in statistics and research. I know the Connecticut Labor Department has benefited tremendously from the Conferences. This afternoon Harry Stark will tell you about some of the effects on our economy, illustrating from economic indicators developed at the State level.

Why are State Labor Departments so vitally concerned with the economy of the State or the Nation? Nothing affects a worker as much as the level of the economy; it affects his job and welfare. In our society today, there is nothing as traumatic as being laid off without income, particularly for a long time. The long-time unemployed were discussed yesterday in reference to the Poverty Program. The state of the economy has a serious effect on anyone, and, certainly, what farmers are doing has a serious effect on everyone.

The Labor Department in Connecticut, as well as others, is vitally concerned with workers. The State Labor Commissioners study conditions and make recommendations for the physical, moral, and economic well-being of the workers of the State. Through this Conference we have been able to move in that direction quite a bit.

What is the level of our economy? We talked to our panel and more or less said this, "We will get Ewan Clague to describe the current condition of the economy and outline its problems." I do not think he is going to discuss future developments but, of course, Ewan is pretty much unpredictable anyway.

The three other panelists may agree or differ with Ewan and, naturally, they are free to say what they wish--but we hope they will outline not only the problems, but some solutions.

We will start off with Ewan Clague, an old friend of the Conference. Ewan has performed outstanding public service in the Federal Government. He is recognized as a leading national economist, but because of the U.S. participation in world development, we do not see too much of him. He has been all over the world for the United Nations.

The sad point of it is, I have been miscast over all of these years in connection with the year 1929. Let me tell you what I did in 1929.

I worked for the Federal Government a few years, 1926 to 1928. Then the part of the Department of Labor that I worked in ran out of money, so I got a job at the Metropolitan Life Insurance Company. My mother's brother, my uncle, was Treasurer of Sun Life of Canada for many years, and my mother was happy that her son was in a good, sound place.

In December of 1929, I gave up that permanent job to take a 1-year assignment at the Yale Institute of Human Relations, to study unemployment. It just did not occur to me that the world was on the verge of a great depression. My decision shows I am not a congenital pessimist.

As it turned out, that move launched me on the problem of unemployment with which I have been connected ever since. My study concerned the shutdown of the U.S. Rubber Plant, an old plant 75 years old. They laid off 800 workers, and my study was one of the earliest studies of what happened to people laid off after a shutdown. The title of our book was,"After the Shutdown."

At the end of World War II, I was still an optimist. Mr. Woytinsky, one of the great analytical economist of this country and one of my colleagues at the Social Security Board, predicted that only 3½ million workers would be out of work in the postwar readjustment. Woytinsky and I preached that doctrine in Washington at a time when many other people thought we would have 8 or 10 million out of work. In actual fact, we did not reach 3½ million. So, I have not always been a pessimist.

The year 1965 has brought record levels of prosperity in the U.S. The Gross National Product in the first quarter of 1965 was $40 billion higher than in the first quarter of 1964, showing an annual growth rate of well over 6 percent, or nearly 5 percent, when allowance is made for price increases. If we do not do any worse than that in the future, we will have a very wonderful economy.

In the first 5 months of 1965, the civilian labor force has increased by 1.1 million over the corresponding months of 1964. By the same comparison, the number of employed has increased by 1.5 million, thereby reducing unemployment by 400,000.

In other words, industry employment is growing faster than the rate of growth in the labor force. Of course, we never escape criticism. I read in a newspaper column recently that our figures are not valid because we do not count everybody.

Is the current estimate of unemployment scientifically accurate? Is avoidable unemployment being created by our own national policy? Is unemployment endangering the entire economy by building up a huge, inflationary potential?

The fact is that our data have been proven valid, although they can be improved in certain details if we have sufficient funds. The testing is now going on. I can tell you that the figures are basically sound within the limits we have described.

Here is another important point. In May, for example, the unemployed amounted to 3.3 million in comparison with total employment of 78.4 million. However, only about 1 million of those unemployed were men 25 years of age and over, the prime workers in the labor force, the full-time workers. The second million was adult women, 20 years of age and over. The third million consisted of teen-agers under 20 years of age; while the remaining 300,000 were men 20 to 24 years of age, who have a rather high unemployment rate, although they are above teen-age level.

What stands out clearly in the figures of the unemployed is the high unemployment rate among young workers. The rate for teen-agers in May was 14.5 percent and the rate for men 20 to 24 years of age was 6.9 percent.

Still another statistic of interest is that married men presently numbered only 800,000 or less than one-fourth of the unemployed in May. The unemployment rate for married men was 2.5 percent. All men over 20 years of age had an unemployment rate of 2.8 percent.

Generally speaking, the improvement in unemployment took the form of providing full-time jobs to workers. In May, 18 percent of the unemployed were seeking part-time jobs. This proportion was about unchanged from May of the previous year. Therefore, the entire reduction in unemployment over the year was among full-time job seekers, while part-time seekers are as numerous as last year.

The employment picture is equally strong. One of the best evidences of this is in the widespread expansion of overtime. The average weekly overtime hours of factory work in the spring of 1965 reached the highest level which has existed since figures were first compiled in January 1956. In durable goods industries, the overtime hours in May 1965, amounted to 3.5 hours, on a seasonally adjusted basis.

That means that among 13.3 million production workers, factory workers, each had nearly a half a day average overtime per week; and that means a good many 6-day weeks for some workers.

Another statistics that is of great interest today is labor turnover. When the quit rate runs higher than the layoff rate, it indicates that we are in a time of prosperity. The voluntary quit rate in this spring 1965 is exceeding the layoff rate, which means that the worker now finds that the job market is such that he can voluntarily give up his job with good prospects of finding another. This is a good indication of the high level of prosperity.

We should not overlook the fact that we do have a serious unemployment problem in this country among youth. Young people constitute the new expanding factor in labor force growth. You have heard me give the statistics many times. Young people--teen-agers as well as adults under 25 years of age--increased only 3 percent between 1950 and 1960. We went through the entire decade of the fifties with almost no expansion of young people in the labor force.

During the Sixties, however, we will have an expansion which should give us very nearly a 50-percent increase in young people under age 25 in the labor force by 1970. We have a large--unusually large--number of young people who are now becoming job seekers.

Between May and July 1965, we shall have nearly 3 million additional youngsters, 14 to 25 years of age, seeking jobs. That includes the 20 to 24 year-olds, who are of college age. In recent years about two-thirds of such youngsters found employment by July, while about one-third did not. If we do as well this year we should have a rise of 2 million jobs and a 1 million rise in unemployment. When you see our seasonally adjusted figures for July, you will see how well we make out with these nearly 3 million entries.

Now, let us turn to prices. For the past 7 years, the U.S. has established a record for price stability. In all other industrial countries, prices are rising. I have some tables which were published in Labor Developments Abroad, a publication of our Division of Foreign Labor Conditions in the BLS.

The table shows wholesale prices in the U.S. as compared to about a dozen other countries. Using 1958 as a base (100), what is the price level at the end of 1964? The answer is 100.4 in the U.S., a little under a 0.5 percent increase from the year 1958, 7 years ago.

Here are the figures for the other countries; Germany, 107, Canada, 108; the Netherlands and Switzerland, 109; Italy, 111; United Kingdom, 113; Sweden, 120; France, 121. You can readily see the countries more or less have a degree of inflation in wholesale prices at home.

Again using 1958 as 100, we had about 108 for consumer prices, a rise of about 1.2 percent, or just about one-tenth of a percent each month. Canada, 109; Belgium, 113; Switzerland, 115; Netherlands, 120; Sweden, 121; Denmark, 127; Italy, 130; France, 130; Japan, 135. These are price rises. Their prices are rising 2, 3 and 4 percent a year, whereas ours have been rising a little over 1 percent a year.

Not all these indexes are strictly comparable, but they provide a reasonably accurate picture of the international situation. The U.S. has been getting into a more solid position from the point of view of prices, while other countries have been entering into inflation.

We are still not out of the woods, however. During 1965, the Wholesale Price Index has begun to creep upward for the first time since 1957. Our index for the month of May was 102.1. It has broken out of a range that has persisted for the last 7 years.

However, I would like to call your attention to the fact that the biggest part of the rise has been due to the recovery in the prices of farm products. In June 1964, the index for meat prices was 89, 11 percent lower than in 1958, and farm products as a whole were 93, 7 percent below the index for 1958. Both of these have risen to a little more than 100, or back to their 1957-59 level. So in some respects this recent rise in the Wholesale Price Index has been due to a recovery from price declines among farm products.

All other prices, except farm products and foods, rose from about 101 in June 1964, to 102.3 in June 1965, a little more than 1 percent.

The Consumer Price Index, generally speaking, has remained quite consistently on its long-term trend upward of 1.2 percent a year or slightly more than 0.1 percent a month. The first significant rise occurred in April 1965, when it went up by 0.4 percent or four-tenths of a point. Percentage and points are about the same when the index is around 109.

This recent rise occurred mainly in fruits and vegetables and in meats. From now through the month of June there will be a generally upward tendency in farm prices, which will make the index move up more than usual. Do not misinterpret that. It is not a trend. Fruits and vegetables usually rise substantially in price during the spring months, when the new crops come in at peak prices. As compared to the low prices the previous September, these spring prices are always high and, of course, this continues during the months up until we finally get the harvests which come in July, August, and September. This year meat prices are firming up very substantially, including pork products and even chickens, which have been cheap for years. Do not convert this short-run rise into a long-run trend, however, until you see how we are doing in September and October.

Next, what are the factors making the economy strong in 1965? One is the tremendous boost in consumer spending. Wages and salaries normally rise between 3 and 4 percent a year on the average (some more, some less). The Consumer Price Index has been rising only about 1.2 percent a year. Thus, our purchasing power generally goes up from 2 to 2½ percent per year. But last year, we got an exceptional boost in our purchasing power. Instead of higher taxes on higher income, this year we had a reduction in taxes. That is, we expanded the net spendable earnings. For the first 5 months of 1965, the real purchasing power of take-home pay of factory workers averaged about 3-percent higher than in the corresponding months of 1964. The consumer benefited from two factors: the rise in money wages and the decline in tax rates. The expansion of the economy in 1965 is undoubtedly due in part to this consumer spending.

Now, the Administration's tax proposal for 1965 is for a substantial reduction in excise taxes on consumer goods. We in the BLS have calculated that under the President's proposal, this would reduce the Consumer Price Index about a 0.5 percent, with about 0.3 percent occurring in the next month or so. We might even get a flurry in the month of June, because of preliminary reductions by merchants rushing to take advantage of the reduction in advance. Certainly, in the next couple of months we should get about a 0.3 percent decline in the index due to this factor, then another 0.1 percent in January, 1966, and the remaining 0.1 percent later on.

There will be an important additional stimulus to consumption, which will come through the rise in Social Security payments this year of 7 percent, retroactive to last January. There will be a flurry in the expansion of consumer buying power. However, on January 1st next will come the increase in the contribution rate for Social Security in order to cover the cost of Medicare and the normal rise of Social Security taxes. So, beginning in January of 1966 the expansionary factors in consumption will be to some extent reversed again by an increase in the taxes coming out of consumers' pockets.

My last point concerns productivity. The factor that really determines the position of the American economy, both at home and abroad, and in moving the standard of living higher in this country, is productivity, output per man-hour; in other words, how well are we doing in producing goods at lower cost? Our statistics for 1964 show an increase in output which was about 3 percent. That is about in line with long-run trends. For the period 1961 to 1964, the average increase has been about 3-1/3 percent, although allowance must be made for the fact that this was a period of recovery from a business recession. Thus, there is as yet no evidence of any spectacular productivity break-through for the economy as a whole. Of course, there are spectacular developments in individual plants, processes, and industries. As a whole, we are doing well, but nothing spectacular.

A lot of West European countries attained increases of 5 or 6 or 7 percent a year, while Japan's was 10 percent a year. But you must remember that they are recovering from war destruction; they are recreating an economy which was once quite high and fell drastically low. They are still in the process of catching up with us.

Don't be mistaken, however. In some industries, they have a higher output per man-hour with lower wages per man, in which case they are certainly producing a lot more cheaply. In the long run, our great problem is to insure that our productivity continues.

We have made a study of this. We have put out a little pamphlet on technological trends, in which we have analyzed the trends of production, employment, and productivity in the postwar period. From these figures we have tried to project probable employment prospects 5 years ahead, to 1970. Our analyses indicate that in a significant number of industries, employment is likely to increase, regardless of the technological changes which are in prospect in those industries.

On the other hand, there are other industries in which productivity may climb about as rapidly as production and, therefore, no increase in employment will take place. Finally, there are some industries in which productivity will rise faster than output and the prospect is for a decline in employment in those industries.

In closing, let me emphasize again that as far as the U.S. is concerned, if we keep our productivity going, we will not have too much trouble on other fronts.

Frazier Wilde, Chairman
Committee on Economic Development
and
President, Connecticut General Insurance Company

It was a pleasure for me to be asked to come before this Conference because one of my weaknesses is to try to tell the other fellow how to run his business. The most important business in this country is to find out how we can make our economy run better because we have great ambitions, and we should continue those ambitions.

I have had mixed experiences in this work, with the management sector of our business and partly with the outstanding economists I have met on the research side. While we do not always agree on either side, I respect other viewpoints, particularly coming from Stanley Ruttenberg and Nate Goldfinger with whom I argue profoundly on practically every occasion.

Today, we hesitate to talk about affluence because the country was recently confronted with a statement by really the most sophisticated and the most learned man in a practical sense who is prominent in economics and monetary matters, Bill Martin, He was badly served by another American tradition of headlines and headline readers--rather than people who read the whole story. You must always remember that Bill is one of those people who has proved he knows something about the stockmarket. After all, he did extremely well by himself when he was a private operator in the stockmarket, and when he says something, we had better listen and not write him off as a pessimist or a theorist or an administrative inside-man in Washington.

If you read Bill's views as a whole, he was quite objective. He was quite objective. He was answering the question which has come up both here and abroad; are we indulging in a little more optimism than we are entitled to, under the theory that we have completely controlled the business cycle? Many of us can hope this could be so, but are doubtful about it. However, I am not going to get into the role of Bill Martin and, furthermore, I do not think it is particularly relevant to think only in terms of short-term forecasts.

I want to discuss with you the longer future and to look at some of the broad problems which in one sense are broader that ever before.

Before doing so, let us try to estimate where we are today. Some of my remarks, even though without collaboration with the previous speaker, may parallel his. Today, we should observe that we have more people at work with the highest rate of pay in the history of our country. Our standard of living is so much higher than that of any other country that sometimes statistics run off the page. In the good American tradition of wanting to beat previous records, we tend to minimize our achievements and our progress and talk about our failures.

Our present situation reflects a successful partnership between business and government. Naturally, in talking about business, I am using an all-inclusive term; I am including labor. I do not regard labor as a commodity; I regard

it as a part of the whole, free, capitalist society which historically has been guided largely by the market-place and which today has surpassed any other society in the world. The great risk that this country faces in the future is that we will forget about this partnership which has been the basis for our progress. This is not idle theory, but it is demonstrated by many foreign examples.

We know statistics are not precise, but they are a good guide, and a commonly used figure for our employment level is 94 percent--not that this is a perfect answer and not that this solves the social problem of unemployment. However, it is a figure that is related to the probability of successful growth without inflation, as the modern term is used. So, we are very close to a goal which accomplishes much, but it would be a tragedy if we do not find ways in the future to come as close as we can to finding a job for everybody who, as stated in the Employment Act of 1946, is able and willing to work. I do not believe we can do it in the next year or perhaps the year after.

In a discussion of the problems before this country, it would be appropriate to discuss the deficit in the balance of payments if we had the time. Unfortunately, we do not, but we should say this much: The current situation requires a change for the better. This is most important because our leadership in the free world depends in large part upon our success in maintaining the value of our money and its availability to help ourselves and the rest of the world.

This balance of payments is a very involved situation, but it is not just a theory which does not affect you and me and our families. Its potential risk, as you know, comes about largely because of our help to other nations militarily and economically, and in part because of the differential rates of money. But, if we were to fail in this regard and our gold were taken away or completely revalued, we would feel it in our economy.

I remember very well--and many of you do, too--the period from 1931 to the next decade when our relationship to the world was upset because there was a lack of balance in the monetary relationship between countries. This related, of course, to our domestic problem of maintaining a stable dollar, restoring high employment, and continuing growth and output.

When we deal with unemployment, we run some risk of getting the cart before the horse. In other words, if we are going to find jobs for the unemployed and add steadily to our standard of living, we need to generate more output. This is fundamental, and it is not arguable: We have to produce more to divide more. How are we going to do it?

We continue to give priority to encouraging growth in the private sector. We should then complement what the private sector does and does not do by appropriate governmental spending.

In the private sector, the evidence shows that the tax structure--while not the whole story--is the single most potent factor stimulating production and growth. The role of monetary policy is important, but not as important as

frequently claimed. Easy and ready availability of money at rates not excessive, along with a stimulative tax policy, produces a combination of production and growth.

Another area, which I will not go into at length, is that shadow-land of regulation of labor, business, and management. Such regulation is best exemplified by the present chaos in the banking field, but it applies to the whole regulatory system in Washington. This must be present at all times, but at the same time we need to turn it around to be more constructive. How can we legislate so that these different components may do a better job in a more positive manner?

In the government sector, the most valuable public expenditures are those which will produce high future dividends. Those which may or may not add to current activity may be useful, but not as valuable as those in the first category.

Clearly in the first category are continuous strengthening of the dollar, strengthening the total educational system, strengthening the health resources of the nation, and urban and transportation renewal. Programs such as the Appalachia Bill are in the second category.

A money rate fluctuating around 5 percent combined with an ample money supply is a much sounder thing than a lower rate produced by excessive generation of credit through the banking system.

Recently, a new price rise has started. From 1958 to 1964, we had virtually no change in the wholesale price index. However, from the end of 1964 to the present, wholesale figures are up close to two points. We know the cost of living went up 1.2 percent. This, happily, does not seem to have changed much, but there may be--and I hope not--something significant in the wholesale price change. Of itself, it is not large enough, but if it indicates a trend, it is not good. There is nothing which poses a greater threat to our future than the possibility of large-scale inflation.

Generally, prices will go up when costs have out-paced productivity. After price increases, we can still achieve higher market sales for a time, particularly if the price increases are supported by a larger money supply. The old rules, of course, always has been inflation: Price changes are due to too much money and too few goods. I do not think the situation is quite that simple, particularly today, because we have had two changes at least.

We have had a technological revolution which tends to keep output high, but we cannot solve it just by that device. We must watch costs. If we get into an inflationary spiral, we will approach what has been aptly described as the most unfair tax of all. Few escape.

There is a theory that if you do certain things like buying stocks, and so on, you will not be hurt. But all of us suffer from inflation both in terms of our domestic economy and in terms of our success in the world. I am strong on the subject because I am an economics student and because I suffered it

myself, coming back from the war in 1920. I could not buy enough goods and services to give my family a fair break.

Although it has not been entirely avoided, inflation has not been a serious threat recently because our productive capacity has increased in most industries. We started with an excess of productive capacity, but a good deal of it was obsolete. Remember, high rates of production are needed if optimal production levels are to be maintained. This is why the Administration wants to allow sufficient tax cuts to stimulate greater purchase of capital goods. Even with excess capacity, we have had continuous pressure on the price structure. This is the fundamental reason we have had increases in wage rates and in other costs.

Total corporate profits are at a new high and they look astronomical when you look at General Motors, for example, but you must remember this is due to large-scale economies and not because of an excessive rate of return. The rate of return is liable to turn down, but if there is anything that makes a Board of Directors expand a plant and give more employment, it is a good profit ratio.

Profits are the basic stimulus to growth in our society, and corporate profits do not remain with the company--something the man in the street seems to forget. Companies are owned in increasing volume by the man in the street. This is unlike Europe, where a few families own many of the great enterprises. In this country, those who run businesses are trustees and paid managers for millions of people who own the businesses.

If you have profits, you can do two things. For one, pay out more to multiple owners. For another, you can increase the size or efficiency of your plant. So we should never worry about the headlines concerning General Motors and American Tel & Tel's profits. They will come back to you and the public for the most part.

Today, the corporations are fearing possible reductions in profit rates, because of rises in costs and many of them seem determined to increase prices. If we can avoid inflation through wage adjustments related to productivity and a middle-of-the-road monetary and fiscal policy, I see no reason why the present success of our economy will not continue and do so on an upward path. This is not to say we can expect a straight upward path. There are certain to be setbacks.

I think, for example, you see it in the statistics on installment payments. They have been rising. Installment debt has been rising higher than it should relative to our total growth, so I cannot agree with the theory that there is no natural law that causes fluctuations. I feel it is based on human behavior. I do feel that through government control and fiscal and monetary management we can succeed in substantially reducing the magnitude of the fluctuations, and that will be a great victory for a free society.

If we can maintain a program of growth in real goods and services of around 4 percent, we will beat our historical record of about 3 percent by a wide margin. This is not one per cent, but 33 percent--something which people forget. When people talk about going forward at 5 or 6 percent, they are talking about doubling our record.

We are more efficient and more optimistic, but we cannot go ahead at that pace. We have not learned how to move forward that fast yet. If we can keep this progress around 4 percent, we will be increasing our standard of living, and we will be in a position to carry on our heavy responsibilities throughout the country and the world.

Philip Taft
Economics Department
Brown University

When Ewan Clague finished his talk, I did not believe there was much to add. He gave his optimistic picture, and I think it is true that the country is more prosperous, more people are working than ever in history, but perhaps it is in times of prosperity when we should seek out the places of trouble.

It is also true that the fate of the free world depends upon the economic and military power of the U.S. I do not think that there can be any question that without the assistance of the Marshall Plan and foreign aid Europe would not have recovered nearly as quickly, not only economically, but perhaps the entire political configuration would have changed.

The maintenance of a high level of prosperity is desirable. It enables more people to enjoy leisure, to enjoy a standard of living which we hold is desirable. Also, there are important political and social considerations. In other words, aside from the desirability of economic progress in itself, it is important for social reasons.

The Great Depression of the Twenties was among the circumstances leading to the rise to power of the Nazis and eventually the Second World War. If you examine the rise of Naziism in Germany, you find that it is positively correlated with the increase in unemployment. The first large expansion of the Nazis power began in 1926. Al Pearce and I listened to Schact when, speaking at the University of Wisconsin--I believe in 1930--, he said that the Nazis were not likely to gain power.

Schact was the monetary genius of Europe. He had been instrumental in restoring the mark after the great inflation.

The threatening aspect of our present unemployment--as Ewan Clague so well indicated--is that it affects the young in a large measure. Fifteen percent of the young people are unemployed. Irrespective of the level of prosperity, as long as that figure is as high, I submit that the country cannot be satisfied with its achievement.

This situation is not only a painful experience for the young, but it is something I believe that no society can afford. First of all, it means that the young people are not given an opportunity to learn a skill. It means that the young people who are unemployed for long periods of time not only lose the opportunity of the present, but they are likely to be relegated to the levels

of the unskilled in the future. In an economy where skill is becoming of increasing importance, the opportunities for these young people in the future are going to be severely diminished.

Also, these young people contain a large proportion of minority groups, young Negro men and women. Irrespective of whether we have an unemployment rate of 3, 30, or 1½ percent, as long as it is concentrated in the young, we must not be satisfied.

The possibilities of nationalization or government control are diminishing in importance not only in the U.S., but outside of the Iron Curtain countries, even Europe. I recently read an article about nationalization, and the writer said that most European countries want to de-nationalize. Some economists back of the Iron Curtain would like to do so also, at least partially, if it were politically feasible.

I do not think there is any question in this country about government control of industry. There is less sentiment for it than at any time I can remember. Even if you pick up the press, such as The New Republic, The Nation, you scarcely find any reference to the desirability of nationalization even of public utilities. I think that this issue--at least for this generation--no longer exists, but the question of the role of government in economic life certainly is an important one.

Mr. Wilde made some references to the dangers of inflation. Well, this is a matter of choice. If we could reduce unemployment by 1 percent, I would take some measure of price increase. I do not think wage and price stability should be a fetish that overrides other considerations.

The first consideration in my opinion should be employment; the employment of as many people as possible and certainly the young. If that means some price rises, the rises might be acceptable at least to some.

In the Twenties, the great fetish was the gold standard. I recall that in 1931 England's unemployment fund reserves were being exhausted and had to be replenished through contributions from general taxes. In 1931, Ramsey MacDonald--who was then Prime Minister of England--appointed a commission headed by a retired gentleman, George May. The committee reported that in order to save the gold standard, it would be necessary to cut social services and teachers' salaries. The unemployment benefit was cut, people were taken off the rolls in order to retain the gold standard--and the gold standard did not last for very long.

I am not necessarily advocating price increases but I would like to suggest that alternative. In other words, our primary purpose should be to try to reduce unemployment. I think that the worst thing that can happen to any society is a division between generations, a feeling by the young that they have been betrayed. I do feel this is an important problem, a more important problem than the problem of the balance of payments, which so far has been manageable--and at least many experts tell me it is not nearly as serious as it is made out to be.

John J. Driscoll, President
Connecticut Council of AFL-CIO

I work in the field of collective bargaining, and only now and then do I get a chance to stand back and look at the effects of the labor movement in recent years. Of course, we have a great many critics who are ready to ridicule the work of the labor movement, but in listening here to the speakers, it occurred to me that when Sam Gompers answered "More" to the question, "What does the labor movement want?", a lot of people thought this answer rather crude and unsophisticated. Some people are inclined to criticize the labor movement somewhat, because it asks for more. Actually, though, I think my comment on our economic outlook is: unless we do get more of the things that people need for a better standard of living, we cannot afford to be complacent about the present outlook.

I agree, Mr. Clague's statistics are on the optimistic side; they show we are better off, as Mr. Wilde said, than we have ever been. Nevertheless, I do think Professor Taft's comment is extremely important. You find a wide variety of attitudes in the labor movement, but I think people today would feel the 15 percent figure for unemployment in the teenage group is not merely a present threat but a growing threat to the whole social fabric.

Then, if you look at this 15 percent figure and realize that among Negro boys it is 22 percent, and that among Negro girls it is 32 percent, you have a literal build-up of social dynamite which we cannot afford to ignore.

The present outlook, it seems to me, should not leave us at all complacent. The figures that Mr. Clague brought out on productivity leave out one important factor. We have now had about 3 years of capital investment in the latest equipment to increase productivity, starting with the tax credit passed during President Kennedy's Administration. Management has been given the opportunity to invest in the most modern labor-saving equipment, just now coming on line. The rate of productivity which we had seems due for a very steep rise. If you couple that with the sharp increase in the labor force, the very great increase in the number of young people coming into the job market, you could have shortly a most critical situation.

Some of the factors which have not been mentioned about the economy deserve attention: the down-turns in residential construction, the fairly certain eventuality that the rate of automobile production will slope off for the remainder of the year, and that unless the steel dispute is settled without a strike, the output of steel will drop. Together, automobiles and steel represent 10 percent of our national manufacturing production. If that decline is added to the downturn in residential construction, we could have a growing problem, something that should not make us optimistic as far as the economic outlook is concerned.

Well, what about employment? Mr. Wilde has emphasized the fact that we are approaching a goal of 96 percent employment, and this sounds very good, but what about the wages of those who are employed? What about the wages of people

in the industries and fields where employment is growing? Is it growing very fast in manufacturing and building construction, in high-wage industries?

I think you have heard the reference to the areas where employment is growing. It is growing in the service trades, the retail trades and in government. Some of the people here probably can tell me about the inequity of wages of government employees, but the fact is that the economy is affected by the great number of people working at $1.25-an-hour jobs, and not necessarily just young people.

Professor Taft might be interested in my experience recently with a fairly large metal-working in this State. They lost a big order, an auto supply order, to a smaller firm in another Connecticut city. They had analyzed all of the competitive factors involved, equipment and production techniques and they also had the competitor's method of operation. They found out that there was only one real basis for the competitor's ability to underbid them about 10 percent; the competitor was hiring retired people, people over age 65, who had retired with some skill in their own trades and who were willing to work at $1.25 an hour, whereas the company of which I am speaking had an average rate of pay of something like $2.75 an hour.

So we have to look carefully at the wages of those who are employed and see whether they are enough to sustain this tremendous productive force that is the American economy; that is, to buy all of the goods we are able to produce.

It seems to us in the labor movement that Mr. Gompers cry of, "More," is something that should be heeded as far as wages are concerned. To have a great many of the employed people earning enough to buy the goods we are able to turn out, each State will have to substantially increase its minimum wage.

What else should be done? What else do we need in the way of "more" to help the economy?

Very often the newspaper headlines express glee in the fact that the labor movement is not growing, or is not growing as fast as somebody thinks it should. If labor is not making progress in organizing this or that field, some editorial writers express pleasure. These people forget that the historical function of the labor movement has been to provide a stimulus to the economy by attaining a greater share of the national productive capacity for workers. In this area, the present ability of the labor movement in a great many fields is limited by the fact of competition from low-wage plants and low-wage industries, especially in mainly unorganized parts of the country. These editorial writers should be critical of employers who do little or nothing about training people for the skills that are needed now.

The way management has been meeting the need for skilled employees is not to train additional people, not to take some of the young people coming into the job market and train them, but to pirate skilled people from other employers. This seems another area where the economy runs into a serious danger of slowing down if there is not enough training to provide the skills needed.

This is disgraceful when one considers how much money is available right now under the Manpower Development and Retraining Program and in programs for apprentice training to subsidize on-the-job training activities. Nonetheless, my experience has been that the major employers--at least in this State--are utterly opposed to undertaking this kind of a program. I do not know whether it is an objection in principle, but it seems a shortsighted and very dangerous point of view, as far as the manpower needs of the State are concerned.

Another thing the labor movement feels would be very helpful, especially as far as relieving the pressure of the teen-age newcomer to the labor force is concerned, is to increase the length of free public education. I find it disheartening, for example, to see that our Legislature in Connecticut recently wound up with a total spending figure of 1.6 billion dollars. Of course, this is not very much when you are thinking in terms of the figures that have been mentioned before, but it was 1.6 billion for a 2-year period. Yet, in terms of what was appropriated for scholarships for Connecticut high school graduates, there was only $550,000.

If Connecticut spent at the rate of Rhode Island, for example, it would be spending something like 4 million dollars a year for scholarships.

There must be 2 additional years of free public education beyond high school. This would be one way of providing additional training in the skills, in the job requirements that are going to be needed for the future.

We think that another way that jobs could be provided or work conditions spread would be to make overtime work less profitable to management; or to put it another way, to penalize management by having a much steeper overtime rate. That is why labor is interested in having the law provide that overtime should be paid for at double time rates.

Tomorrow morning, I have an early meeting with a local union which wants advice on how they can get around one of our State laws here so as to work 7 days a week. Seemingly, the employer wants them to work 7 days a week, and they want to find out how they can do it. Well, of course, they are not going to find that out from me. I will show them a way to handle the situation, but I will not show them a way to work 7 days a week continuously. This is the kind of pressure, the kind of problem we run into in the labor movement and one which is not being met by present laws or by present economic planning.

I think that Frazar Wilde's idea that we can solve these problems by cooperation between government, business, and under the heading of "business," he included labor, is certainly an excellent one. I would join in hoping that more and more managements would share his point of view.

We are in a society which has shown the real benefits of free enterprise and free competition by the kind of cooperation Mr. Wilde mentioned. We can make that society bear even greater fruit and make this country a bulwark for all peoples who want to join us in a measure of prosperity as well as freedom.

CHAIRMAN PINSKY: We will now open the panel to questions, but first I would like to ask any of the panel if they wish to comment on any of the other speakers.

MR. WILDE: I hope no one, of course, would think I am not interested in the 15 percent rate or any important percentage of young people not employed but I think that to rely on creation of job opportunities through what the economists call "rapid increase in aggregate demand" is completely unrealistic. These young people can be served best only by specialized training. We ought to do a lot more of it, and I am always troubled--along with Mr. Driscoll--over management's attitude toward furnishing apprentice training.

What Professor Taft is saying, to put it bluntly, is that because there are 1.3 million unemployed teen-agers out of a total unemployed of 3.6 million persons of all ages, we ought to expand aggregate demand that much faster in order to reduce unemployment in the lower age groups.

I cannot see that it equates at all. To me, it is completely untenable, but beyond that, inflation always leads to more inflation and a collapse, and nobody has a job, so this is one point which may need further clarification.

PROFESSOR TAFT: I was not advocating inflation, Mr. Wilde. I simply said that we should not make price stability the overriding goal to the extent that, for example, in order to prevent some price increases we would not raise the discount rate. I do not think anyone advocates inflation just because it represents a tax. Even if it were a tax, we pay other kinds of taxes. It is an unjust tax and a random tax; it hits the just and sometimes rewards the unjust. I know what the difficulties of inflation are, and I do not advocate it, but I do feel that making stability the prime objective--for example, in the whole discussion of the balance of payments--is largely the result of our political policies.

I am not arguing that we ought to change our commitments abroad, but really, is not the balance of payment problem the result of our political commitments? When we examine the balance of payments we are doing pretty well as far as our balance of exports is concerned. So I am not advocating inflation. I do not think anyone does, but I do feel that the excessive concern with stability may prevent us from doing certain things which may reduce the level of unemployment.

I agree with what you have said, that a great deal of the problem is to train these young people. I think one of the most creative programs that has been effected for the last 30 years has come from this Administration's effort at least to train and try to fit the young into the labor force.

Sometimes our memories really do us a disservice. I recall two things. One, I recall the whole series of articles that came from some very distinguished economists and other that the gap in productivity between the American economy and the non-American would widen. Also, the discussion in 1961 was that nothing could be done through fiscal or monetary policy to reduce unemployment, that we had a problem of structural unemployment.

James Mills, in my opinion, wrote an outstanding analysis of this problem of structural unemployment and the impact of aggregate demand on employment. He did not need to convince me, but he certainly provided additional evidence that much could be done by other methods, that the unemployment was not only the result of lack of skill or exhaustion of raw material, but it was also an aggregate demand problem and it could be met by proper government policy.

I am not advocating any policies here. I do not know whether you can reduce the level of unemployment below 4.0 or 3.5 percent. I do say, again, that if we could, we would be rewarded. As a matter of fact, we might suffer from price rise, but our Gross National Product would rise.

MR. JOHN W. LEHMAN: Mr. Wilde, in light of the increase in Social Security taxes, of which Mr. Clague has reminded us, and the kind of drags Mr. Driscoll suggested in changing inventories, is there a possibility of some other drags on the economy occurring? Do you think we should now in some way be contemplating and planning for a further reduction in the income tax rate to take effect next year?

MR. WILDE: I do in this way: I am an advocate of the Congress adopting a formula of tax changes up or down with the timing of their application left to the President. I think that this is the simplest way rather than deciding now on the timing.

If we gave the President within limits the right to change the tax rate, I think it would be a very wise move. I have been in this field a long time. Under Eisenhower in 1958, I was one of a small group in the Treasury working on this project. I do not claim expertise in the tax field, but I have been at it a long time, and hope I have some understanding.

MR. DRISCOLL: If you are thinking of providing jobs, I think it would be much better to have the Federal Government increase its expenditures. The level of Federal expenditures, as I understand it, at the present time is also leveling off. If the Federal Government increased the kind of expenditures Mr. Wilde talked about earlier, in the fields of education, health, and also in the field of public works, the number of jobs that would be provided--especially in the unskilled area--could be substantially increased.

So rather than having a tax decrease, it seems to me that we should more properly be thinking about an increase in Federal expenditures.

As a result of the tax decrease of last year, I saw some figures which indicated that we have dropped down from something like $650 per capita spent by the Federal Government in 1954 to something like $520 per capita this year. So we are not splurging by any means, and there is some danger, it seems, in a further tax decrease when there are so many unmet needs and so many ways the Federal Government could be spending money that would put people to work.

MR. CHARLES BULLOCK: I would like to address a question to Ewan Clague. You did not mention the housing construction segment. In view of the fact that

the question has been raised as to whether or not this is declining, do you have any final figures on the construction sector up through April? Has there been a turn upward?

MR. CLAGUE: You are talking about unemployment?

MR. BULLOCK: Either about employment or construction outlays, but I meant employment from your point of view.

MR. CLAGUE: Employment has been better in this last month or so than it was a little earlier in the year. There is some problem concerning home building and housing vacancies in some areas.

My understanding is, for example, that in New York City there is a rather unhappy development of vacancies in higher rent apartment buildings, which may have some bearing on mortgages and values. There is a small cloud as yet on the horizon, and it may be one that would bear some watching. That is about all I know concerning it.

MR. SIDNEY HATKIN: Professor Taft, I do not know if you purposely avoided going into specifics or not, but if you were the Chairman of the Council of Economic Advisers and you had it within your power to put some policy into effect for employment of teen-agers, how would you distinguish between summer employment and full-time, regular employment of teen-agers?

PROFESSOR TAFT: I do not believe that you can distinguish. There are some jobs that are peculiarly teen-agers' jobs, but many jobs that are done by teen-agers are done by people of other age groups as well, so I do not think you can do that.

Then you asked me about distinguishing between summer jobs and others. I suppose summer jobs may be to some degree created both by private and public agencies in order to employ teen-agers because of the large numbers that depend upon summer work; but I think this is a problem of much smaller significance. While it is unfortunate and certainly should be regretted, I do not think that this is really a type of major problem that we are discussing. The summer employment of young men and women who go to school is not the major problem, but rather those who have left school and are now in the job market should be the focus of our concern. As Mr. Wilde said, we should endorse better programs of vocational education or the financing of vocational education by the State or by the Federal Government. Some of the programs that are now being formulated, it seems to me, would be a good step in that direction.

As you undoubtedly know, the number of youthful unemployed is a proportionately large percentage of the total unemployed. The young have always had a larger percentage because they are inexperienced, they have no skills in most cases, but the unfortunate part of the present situation is the tremendous increase in their percentage, which is something quite new, something that has developed within the last few years; that is, it has been rising since World War II. I think this requires changing.

On the other hand, if we could get the economy expanding at a slightly higher rate, we might be able to pare that number down. I cannot provide you with a detailed blueprint, but it seems to me this is the way I would answer.

MR. CLAGUE: I think that I might give you a few facts in connection with this because it differs from the adult picture.

In the first place, let us remember that during the winter a great deal of teen-age employment is part-time; the young people are seeking part-time jobs to enable them to stay in school. In that sense, the Neighborhood Youth Corps Program will serve a great need. Shortly, they expect to have 100,000 actually on the rolls, and the program is to provide for at least 200,000.

This means Federal money, for the most part. It is a kind of isolated employment in the sense that the jobs are supposed to be outside the competitive system. The payment of wages is not supposed to be so high as to lead workers to favor this system over a full-time job in private industry. If it puts a quarter of a million or more youngsters to work during the upswing of the winter months, this certainly will affect the unemployment figures.

This is a way of reducing unemployment by a form of community employment, and it is part-way between what Mr. Wilde and Mr. Taft were talking about. When I was a boy on the farm, we used to get out of school in May to cut the hay. Now, we do not hay any longer, so this is an institutional obsolence. It is not needed and there is no reason why the schools should not run most of the year round.

MR. HAROLD HEINTZ: Mr. Driscoll proposed and advocated a policy of extending public education by 2 years. I wonder if Mr. Taft and Mr. Wilde could comment on that?

MR. WILDE: I, of course, have no firsthand experience, but I have just served on the legislative committee for higher education for this State, and I am completely convinced that the State is derelict and should do more. An opinion on the particular facts of how you do it, through scholarships or more free schools and what their curriculum should be, I would leave to Professor Taft. In substance I agree this State should provide more.

PROFESSOR TAFT: Being a teacher, I suppose I ought to say it is a wonderful idea. The fact is a lot of that has been going on and, of course, the problem is that school enrollment has been stimulated both by the rise in income of the general population and also by the baby boom of the postwar period. Many States are trying to meet that problem by expanding their facilities. This, I think, is a very difficult problem, not only from the point of view of State budgets, but also from the point of view of staff and provision of student facilities.

I do not want to sound smug, but a great deal has been done along this line in areas outside of New England. Ewan Clague and I attended the Univeristy of Wisconsin, and at that time it had eight or nine thousand students, and anyone who graduated from an accredited high school in the State could go to the University, and he would be flunked out if he did not do well.

Now, California spends about 300 million dollars a year on its university system, and it has a State college system, two systems of higher education, and other schools. Michigan has four large universities. Illinois has several. Many of the cities do; New York City several colleges, and others are in the process of being built.

I think that many States have done a great deal, yet the burden has been very heavy. I do think that the bottleneck is going to be the demand for college teachers. People who are retired have offers to teach, and it is really wonderful for the first time to be a college teacher. You are going to run into a problem there, so I do not want to give any categorical answers, but I think we should recognize it is a very expensive problem for the States and communities. There are problems of staffing, recruiting and maintaining colleges that are not easily solved.

MR. ROBERT H. FRANKLIN: Commissioner Clague, what sort of techniques do you suggest for reconciling the conflict between those political leaders who wish to be able to continue to predict rosy economic conditions and the technicians and experts who are in a position of having to make a forthright evaluation of statistical trends, economic effects as they see them? I am thinking particularly in terms of the States which have been doing some work with economic indicators and who perhaps may be faced in the future with this problem.

MR. CLAGUE: I have had to reflect on this a great deal during my career, and not just recently, because we try to foresee the future. As a matter of fact, my wife often says she wishes I would come back from the future.

At any rate, we are always planning. My old techer, Professor Collins, always used to say, "Our existence lies in the future; live for what you are going to do next."

In that sense, at times we forecast in order to be wrong. I mean by that, we are talking right now about young people for the next 5 years, and as Phil Taft said, this year is only the beginning. We are going to have three million more next year, so this is going to go on through the early Seventies.

If we predict trouble in relation to that and call attention to the difficulties arising--as Mr. Martin was doing perhaps--and something is done about it, then our predictions will be wrong.

In that sense, we forecasters serve a valuable purpose, even when we are completely wrong--and I am not sure I did not serve a valuable purpose: We got a tax reduction last year.

DEVELOPMENTS IN STATE AND FEDERAL STATISTICS AND RESEARCH

Chairman: Carl Cabe, Commissioner
Kentucky Department of Labor

CHAIRMAN CABE: We tried to select some of the more important topics on State and Federal Social Research programs for the roundtable discussion, apart from the symposium, and have chosen three major ones dealing with economic change, productivity, and education.

First, to discuss measuring economic change is Harry Start, Executive Director of the Bureau of Economic Research at Rutgers, the State University.

MEASURING ECONOMIC CHANGE--A PROGRAM OF ECONOMIC INDICATORS

Harry Stark, Executive Director
Bureau of Economic Research
Rutgers--The State University

During the session on the War on Poverty, I heard several speakers refer frequently to the uses and abuses of data in relation to aspects of the anti-poverty war; suddenly, it occurred to me why I find statistics and bits of economic data and information so comforting and useful. What occurred to me is that there is safety in numbers.

If we take a lot of data in aggregate or disaggregate, the very numbers concerning the poverty-stricken individuals cause these persons as individuals to recede into the background. It is much easier to cope with these problems when we can look at numbers rather than face real people.

The involvement of the Conference with economic indicators began when Gerhard Bry read his paper on "Business Cycle Indicators for States and Regions" at the 19th Interstate Conference at Bloomington, Indiana. Subsequently, Commissioner Clague appointed a committee to develop the indicator project. I had the privilege of serving on this committee which was chaired by David Pinsky of Connecticut, and included a number of our colleagues in the U.S. Department of Labor, as well as Gerhard Bry. Murray Dessel of the Census Bureau, Hyman L. Lewis of BLS, and Sidney Feldmann and H. Daniel Darling of BES were members of the group.

Data for a number of key economic time series were collected with the co-operation of several States and used as a basis for a further, more detailed paper by Gerhard Bry and Charlotte Boschan at the 21st Annual Conference in San Francisco. By that time, California, New York, Texas, Florida, West Virginia, Michigan, and Pennsylvania had contributed information and had worked cooperatively with the project, as had New Jersey and Connecticut. By that time, also, New Jersey, and shortly thereafter Connecticut, were ready to issue monthly sets of economic indicators patterned after the work of the National

Bureau of Economic Research and available for the Nation in the Census publication, Business Cycle Developments.

With the format and the practicality of economic indicators for States having been demonstrated, and with several State publications being issued regularly, the Indicator Committee decided at the San Francisco Conference that at least a certain phase of its basic work had reached completion. A summary report was made at the Miami Conference last year.

The project proved to be a good demonstration of effective Federal-State cooperation involving the BLS, BES and the Census Bureau with State labor departments, employment security agencies, and, at least in New Jersey, with a State university.

In several States, the development and publication of economic indicator information provided an impetus and focus which enabled State labor departments to fulfill the useful function of broadening understanding of the economies of their States and regions and in supplying State officials with information needed to develop effective public policy. You will hear shortly a detailed account of the development of the Kentucky economic publication as an example of one State's experience.

It would be well to establish a registery or clearing house so that such experience could be shared among the several States already involved. The experience could also be made available to those in which similar projects may be undertaken. We have kept in touch informally with interested parties, but this may not be sufficient.

We can take advantage of the fact that in a number of States economic information has long been organized and published regularly by university bureaus of economic and business research. It seems logical that a State labor department and a State university would find an economic indicator project to be a mutually advantageous subject for collaboration.

Significantly, the several illustrations which we have of State economic indicators developed as part of this project and the numerous examples of economic time series published in many States around the Nation show that each jurisdiction develops the kinds of material, information, and frame of reference which are useful for its own purposes. Although a standard format of economic time series set graphically against a background of the reference business cycle has come to be identified with indicators of the type to which we are referring, the method of presentation can and does vary broadly.

This variation brings me to a major point that I would like to use as a way of turning our discussion away from indicators as such and on to economic change. We are trying to measure changing economic conditions. It is obvious that the economic indicator format with which we have been concerned over the last several years has primarily been intended as a means of identifying changes in the business cycle, and making comparisons among regional or State cycles. Later, Professor Bourque will give you an excellent illustration of the use of employment data as a device for comparing State and regional cycles.

However, it is clear that we must ask ourselves what kind of change we are trying to measure and keep track of.

A look at the program of this present Conference shows that the business cycle remains significant, but it does not receive the central attention which it may have had in 1961, at the time of the Conference in Bloomington. This is partly a matter of timing and partly a matter of evolution in our concern at the State level with social and economic problems. We are now concerned with the causes and effects of the maldistribution of income, and there are many facets of our economy that we would like to measure from this perspective. In my opinion, it will be most useful if the several economic indicator projects, as they develop, can include information which illustrates these and other aspects of economic activity. Income data increasingly are becoming available for States and regions. The Department of Commerce will soon publish a quarterly estimate of personal income, by States, seasonally adjusted, which will include county detail.

We have added to the New Jersey Economic Indicators a time series showing the number of persons receiving general public assistance. This is a useful cyclical measure having a lead-lag pattern. The series calls attention to the volume of welfare activities in such a way, we think, as to heighten an awareness of its relationship to other movements in the economy. The job openings series, added to the Connecticut and New Jersey indicators, may be useful for manpower retraining efforts, especially if area detail can be provided.

Increasingly, the kind of economic change that we must be sensitive to and use our data to illustrate, goes beyond the business cycle. Federal Reserve Chairman Martin warned that business contractions have not necessarily been made obsolete. Thus, it would not be desirable to dismiss cyclical analysis completely. However, it is clear that changes in structural employment, income and population, and shifts in location are the kinds of dynamic activities which our data must be organized to reflect, if economic reporting at the State level is to be useful.

The incongruity of poverty in wealthy States as well as in poor States, requires that we modify our approaches in both data collection and analysis. Connecticut and New Jersey were happy to become involved in the indicator development at an early date and they share the distinction of having the most favorable family poverty indexes in the Nation. Yet, in both States there are major metropolitan areas such as New Haven and Newark where the acute problems of poverty are being faced, and where experimental programs in the war against deprivation are being carried out. We must use our economic information to reveal the relative differences among sub-regions within States. Clearly, the major economic areas closely related within States may have widely different characteristics and problems.

Labor statistics provide a wealth of information which can be used to illustrate these differences and changes in their magnitudes over time. I am thinking particularly of structural changes in employment which can be measured at various time intervals. The comparison of structural distributions through time might show how a State's economy is evolving; this evaluation

perhaps could be demonstrated rather simply in chart form to the readers of conventional cyclical indicator publications.

Fundamentally, we must be concerned with regional growth and development, and with demonstrating the differences and similarities among regions and subareas. Devices of regional analysis other than cyclical indicators will have to be employed if we are to understand these processes. I am not simply advocating cyclical indicators for all Standard Metropolitan Statistical Areas or counties. We do need regular indicators of economic change by area, and we will have to experiment to find the most concise and useful presentation format.

We must try increasingly to identify the components and causes of change. Useful illustrations of devices for such analysis appear in two Survey of Current Business articles. The April 1964 issue contains an analysis, by State, of changes in personal income attributed to national growth, industrial mix, and regional share. This analytical technique can be used for showing comparative changes by regions within States, also.

The same technique is used with employment data in the October 1964 issue. The same three measures--national growth, industrial mix, and regional share --are identified by States on the basis of employment data. A number of articles using this technique of analysis for States and local areas have already appeared. Some of the results can be shown graphically and used to broaden the understanding of fundamental movements in local economies.

The importance of employment and income data is critical in this illustration. In the War on Poverty, we are concerned with income. Data on income distribution are exceedingly difficult to obtain except in census years; however, perhaps a relationship between employment and income can be established for specific regions. Structural and secular movements in employment can be traced for major metropolitan areas and, in many instances, for other county and municipal divisions on the basis of covered employment information. It may be possible to understand and follow the evolution of employment patterns and from this information derive some indication of changing income patterns in the major urban regions of this country. The wage data collected as part of the current employment statistics program is a critical element in many other calculations and may provide another link with income data for the purposes of area analysis.

I realize the complexity in matching household and establishment data concepts, but experimental analysis will be necessary for any State labor department which is trying to enlarge understanding of the economy of its own region and to make an effective contribution to the War on Poverty.

In summary, what I am suggesting is that the central issue with which the indicator project was concerned at the outset--that is, the business cycle --is only one of the economic phenomena which we must try to discern and measure. Also, that the proper function of State labor statistical agencies should be to enlarge the evidence and improve the presentation of economic data so that business cycle changes can be kept in perspective with other critical changes of increasing concern.

We must relate labor statistics, particularly employment and wage data, to changes in income, population, and location for States and regions, so that the changing character of the economy can be understood and so that the impact of various programs for affecting income distribution may be discerned and evaluated. This will require more analytical study and interpretation. Simple presentation of data in graphic or tabular form will not do the job, even though current seasonally adjusted data are made so conveniently available by computer. I realize that resources for extending this work are costly and scarce, but I respectfully submit to State labor commissioners that this work must have a high priority if labor statistics are to have any practical applications to program planning and policy formation at State level.

Don M. Soule, Director
Division of Research and Statistics
Kentucky Department of Labor

Development of the Kentucky economic indicators, early in 1964, was relatively easy, mainly because of prior work by Harry Stark, David Pinsky, Gerhard Bry, and others. Of course, the seasonal adjustments were performed in a matter of minutes with Abe Rothman's computer programmed method. The data sources were cooperative and, in all but one case, free.

Some inportant results can already be credited to the Kentucky Economic Outlook, a publication which contains the economic indicators. We discovered, for example, that Kentucky's nonagricultural employment was nearly constant from mid-1963 to mid-1964. The original data showed increases, and even the seasonally adjusted figures showed some increase, but, when plotted on the chart in seasonally adjusted monthly amounts, a clear plateau in employment could be seen. This plateau in nonfarm employment had received no mention in the press and probably would have gone unnoticed publicly had it not been for the Kentucky Economic Outlook.

The 13 economic indicator series also disclosed a mild recession in Kentucky in 1962. Of course, it was not news that individual series had their ups and downs over the years, but the decline in most of the series during 1962 indicated a mild downturn. That downturn might not have been identified as a recession had there not been a publication showing economic indicators for Kentucky.

The main result, aside from the specifics mentioned, has been to emphasize several elementary, but nevertheless basic, needs in presentation of economic data. Seasonal adjustment of monthly data, as we all know, is very useful, even essential; but many otherwise informed people do not understand the necessity of seasonal adjustment.

There is also the need for viewing monthly economic data over a period of years, rather than merely compiling the current month's figure and comparing it with that for the previous month and the year before. Analysis of changes in the economy becomes more meaningful when many economic indicators are

viewed together, with each one presented in seasonally adjusted monthly data over a period of several business cycles. Publication of our indicator series, plus the accompanying commentary, has stressed the advantages of this type of analysis. Composite indexes and separate series presented merely in tables do not give an adequate picture.

The several problems encountered in publishing Kentucky Economic Outlook could perhaps also be viewed as opportunities for education. For example, labor union officials have from time to time informed me that they cannot understand the indicator charts because the charts are too complicated and too numerous. There seems to be a widely held belief among union people that a State labor department exists almost solely for labor and should provide service only to labor; but here we are spending money to issue a report which they cannot understand and which mainly businessmen read.

It has been difficult to answer their complaints adequately. Of course, they are told of the various advantages already explained.

Maintaining reader interest was anticipated as a problem, and the solution has been to include a special article nearly every month. Special articles have concerned a variety of subjects, including: a geographical comparison of work stoppage data; employment changes between 1950 and 1960, by industries; work injury statistics, by types, sources, industries, etc., with emphasis on how to interpret these data; types of jobs obtained by minors as evidenced by work permits issued, accompanied by a brief explanation of child labor and related work laws; and a description of several work accidents--how they could have been avoided, their cost to both worker and employer, and how treated statistically. We have several times featured employment and unemployment statistics and emphasized how to avoid misinterpretation and misuse. Our mailing list, from which you can obtain these studies has remained constant in size for the first year of publication. These are free, but obtainable on request only.

After several more years and with continued good luck, we will have sufficiently made known the do's and don'ts of statistical presentation and analysis that more of our information will be recognized as the truth. This much-to-be-hoped-for result could trace its beginning to our effort to present economic indicators for Kentucky.

REGIONAL BUSINESS CYCLES IN THE UNITED STATES
(An Empirical Study)

Philip J. Bourque
University of Washington

Central to the concept of business cycles is the notion of concurrent fluctuations in the rate of economic activity among most of the major components of a nation's economy. The pervasiveness of periods of expansion and contraction at about the same time in diverse activities is basic. In this respect, factual investigations of fluctuations in the industrial components of the national economy provide no doubt as to the generalized participation of production, employment, income and spending in a pattern which gives content and reality to the abstraction called the business cycle.

"National" business cycles may be viewed as a weighted aggregate of specific cycles in various sectors of the economy with a given pattern emerging because of the preponderant weight of processes with roughly equal time spans. The sectors of the economy whose cyclical characteristics have been studies in detail have been mainly the industrial components, commodity groupings, income classes, or production stages. Much less attention--certainly much less than contemporary discussion of depressed areas of the economy warrants--has been given to cycles in regional components of the American economy.

If we wish to establish the variant and invariant characteristics of cyclical behavior, a regional appraisal is certainly a plausible dimension in which to view the aggregate. Mitchell observed 2/ that in no country is the development of the business economy uniform over all sections and that this uneven development influences the course run by business cycles in different areas. Because of regional specialization, reflected in the differing proportions of industries and occupations, and because of divergencies in the business cycle hazards to which various activities are subject, regional differences in cyclical fluctuations are to be expected.

Such regional differences have become increasingly important for policy as particular areas of the nation have shown a stubborn reluctance to respond to national growth policies. The jargon of the economist reflects increased concern with regional differentiation in the labor areas of the nation: lagging sectors, distressed areas, localized unemployment, depressed areas and impacted communities are part of the lexicon. This heightened concern for regional dissimilarities suggests it is worthwhile to examine business cycles for spatial characteristics.

2/ Mitchell, Wesley C., Business Cycles, The Problem and Its Setting. National Bureau of Economic Research, Inc. New York, 1927, p. 174.

This paper reports the findings of an examination of cyclical fluctuations in the continental States of the United States during the interval 1947-1960. Specifically, the study pinpoints the timing and amplitude of cyclical fluctuations in employment. Establishment of the cyclical behavior of employment among States in three postwar business cycles leads to a consideration of several aspects related to interstate differentials, particularly (a) lead-lag evidence, (b) comparative amplitude, and (c) the relation of State cycles to income and growth.

Scope and Method

Monthly reports of the levels of total nonagricultural and manufacturing employment as reported by the employment security agencies of the 48 continental States and the District of Columbia are utilized in this analysis. The seasonally adjusted monthly data for each of these series and for each State were analyzed for specific cycle peaks and troughs following the techniques developed by the National Bureau of Economic Research. 3/ According to this approach, cycles are defined in terms of periods of expansion and periods of contraction without relation to a trend.

On the whole, specific cycles in the two employment series for each State stand out with reasonable clarity and with fairly good correspondence to the postwar reference cycle chronology of the NBER. But there were several States in which the cycle turning points were quite weak relative to trend and irregular movements and, therefore, difficult to identify. The two parameters of specific cycle movements--the dates of peaks and troughs and the levels on these dates are hardly ever defined with the desirable degree of certainty. 4/ Of these two values, the dating of the turning points is least certain since some sideways movement near a turning point might suggest dating a reversal in the series at any of a number of different adjacent months. 5/ In such cases there is usually little difference in the measured amplitude as a result of choosing one turning point date rather than another, but there is potentially considerable difference in the numbers of months of duration of expansion or contraction. For this reason, analysis of duration and of lead-lag relationships are less certain than amplitude comparisons.

3/ Burns, Arthur F. and Mitchell, Wesley C., Measuring Business Cycles. National Bureau of Economic Research, New York, 1947, pp. 56ff.

4/ An average of the 3 months centered on the peak and trough dates was used to designate the level of the series at the turning points.

5/ If the sideways movement was judged to be a plateau, the reversal was dated the last month before the pronounced change in direction. If the sideways movement involved a slight shift in direction, which after a few months was followed by a pronounced movement, the dating of the turning point depended on the strength or weakness of the initial decline as compared with the cliff. No mechanical rules were established as criteria.

During some national reference cycle contractions no corresponding specific cycle contraction could be identified in a few States because of overwhelming trend or irregular movements. 6/ For the most part, however, State cycles were associated fairly closely with the reference cycle chronology. The major exceptions were as follows: (1) the specific cycle movements of Idaho nonagricultural employment appeared so out of phase with those of the nation that they could not be matched with the reference cycle, and (2) a number of States had an "extra cycle in 1951-52, a period in which the Korean War military remobilization of resources generated a short but decisive slack period in production and employment.

The Timing of Regional Employment Cycles

Charts 1 and 2 show the number of States reaching peaks and troughs in nonagricultural employment and manufacturing employment in each month of the 1947-60 period. The shaded areas in each diagram indicate periods of contraction in the corresponding national series.

It may be seen that specific cycles in State employment have turning points which cluster around the turning points of their corresponding national aggregate. This is, of course, what is anticipated since the national movement is

---

6/ The States for which no corresponding specific cycle could be detected may be of interest. Highly irregular movements in Idaho nonagricultural employment made identification of the cycle movement unsatisfactory. In addition, the following States did not have contractions in nonagricultural employment during the national downturns indicated:

Florida		1953-54	
Montana		1953-54	
New Mexico	1948-49		1957-58
North Dakota	1948-49		
South Dakota	1948-49	1953-54	

No cycles were identified for manufacturing employment in the following States during the contractions indicated:

New Mexico	1948-49	1953-54	1957-58
Florida		1953-54	1957-58
Nevada		1953-54	
Utah			1957-58

Every State participated in expansions during business cycle upturns. In the analysis of amplitude changes, the rise in States not having preceding contractions was measured as the change in level between NBER reference cycle dates.

the weighted aggregate of individual States. 7/ But there is also considerable variation among the State turning points from turning points of the national aggregate. This means that, even though the national series under discussion possess specific cycle peaks and troughs roughly coincident with the NBER reference cycle, the individual State series are not necessarily coincident with the NBER reference cycle. The lower turning points in State series of nonagricultural employment vary from as much as 9 months before to 8 months behind the national series. At peaks the range is even greater--from as much as an advance of 17 months to a lag of 9 months. The mean deviation of State turning points from the national series at the troughs of nonagricultural employment is 2.2 months in 1949, 2.6 months in 1954, and 2.4 months in 1958. At peaks the mean deviation is quite variable, being as little as one month in 1960 (when the turning points in 28 States coincided exactly with the national series) to as great as 4.0 months at the 1957 peak.

Although one might expect that State manufacturing employment, both because of its more homogeneous classification and because of its more pronounced cyclical sensitivity, would show more uniformity with the national aggregate than the nonagricultural series, such is not the case. As shown in Table 4, the State variability for manufacturing employment about the national total is somewhat greater than that of nonagricultural employment.

What is the significance of the dispersion characteristics? There is sufficient bunching of State turning points for us to be satisfied that national business fluctuations are geographically pervasive. However, there is also sufficient spread to indicate that all regions are not affected simultaneously. Some States even reach troughs while others are at cyclical peaks. Local circumstances (including industry mix) must command the situation. There is no significant association between the degree of clustering of State turning points and the severity of national cycles.

Lead-Lag Characteristics

In view of the wide range over which State turning points are found, it is natural to ask if some States, or groups of States, are typically leaders or laggards at business cycle turns. The few cycles covered by this analysis allow for some persistent leaders and laggards on the basis of chance alone, of course; the results, therefore, must be considered tentative.

7/ This is so in principle, but in fact the sum of the State series does not equal the national aggregate either on an original or seasonally adjusted basis. We are cautioned by the BLS that ". . . the sum of the State figures may differ slightly from the equivalent official U.S. totals because of differences in the timing of benchmark adjustments, slightly varying methods of computation, and, since January 1959, a different classification system."

The lead-lag possibilities were sought by the following procedure. The States which were consistently leaders or laggards at each of the three troughs were identified. Since there are four peaks and only three troughs in the period covered and hence the criterion to be met is somewhat more severe for peaks, those States which consistently either led or coincided with the peak in the national series were identified as leaders. The analysis of lags at the peak was relaxed also to include coincident timing occurrences. The results of this screening are shown in Tables 5 and 6. The rankings of these States in respect to severity during expansions and contractions, and in respect to growth rates, are also shown.

In view of the incorporation of the trend during intra-cycle phases when using the NBER method of identifying cycles, we might expect that States with strong rising trends would tend to lead at lower turning points and lag at cyclical peaks. We might also expect that States with strong cyclical expansions and weak contractions would lead the troughs and lag at peaks.

The States lagging at the trough of nonagricultural employment--Pennsylvania and West Virginia--meet the expected conditions. Both States have strong contractions, weak expansions, and weak growth rates. The two States which tend to be precursors of cyclical downturns--Maine and Rhode Island--also meet the expected conditions in that they have severe contractions, weak expansions, and weak growth rates.

The States which lead at the troughs of nonagricultural employment--District of Columbia (DC), Tennessee, and Mississippi--have relatively weak contractions and fairly strong expansions, but their growth characteristics range from weak (DC) to strong (Mississippi). While these two Southern States and DC show an upswing in nonagricultural employment earlier than the national series, they do not lead at the downturn. It would appear that no strong case for systematic regional timing differences can be based on the nonagricultural employment series.

The evidence of some States regularly leading and lagging in manufacturing employment series is stronger. The most pertinent observation to be drawn from Table 6 is that Southern States tend to be dominant in a rather lengthy list of those which consistently lead the recovery in manufacturing employment. These 11 States that regularly lead at the trough include five in the South, three in the West, two New England States and one Plains State. Most of these have above average growth rates, fairly strong expansions, and weak contractions.

These findings partially support the Vining thesis that the South, the Great Plains, and Rocky Mountain States ". . . appear to be the lead-off group when a shift takes place in the direction of change of the rate of change in national income." 8/ However, the Vining thesis implies that the predominantly

---

8/ Vining, Rutledge, "Regional Variation in Cyclical Fluctuation Viewed as a Frequency Distribution," Econometrica, Vol. 13, No. 3 (July, 1945), p. 209.

agricultural and raw material oriented States also lead a cyclical decline; the analysis does not support this conclusion. On the contrary, the leading States at the peaks of cycles are Rhode Island, Illinois, Wisconsin, and Kentucky. Southern States are found among the laggards at cyclical peaks. This behavior is consistent with a hypothesis that Southern States are more recession proof; that their oscillations are more limited. If any region can be considered as the impulse-generator or breeding-ground for cycles, this evidence should rule out the South.

Aside from the impression that Southern States tend to lead a recovery, and perhaps even have somewhat more sustained advances frequently terminating only after the national downturn has begun, there is little further in the form of a spatial configuration. In view of the small number of States identified as consistent leaders and laggards--and our screening test cannot be judged very severely--we must conclude that if a further pattern exists it will take more experience and/or more sensitive measuring instruments to identify it. Even the few States that have shown uniformity in lead-lag relations in the 1947-60 period may fail to continue to do so.

Amplitude of cyclical change in the identified cycles for State nonagricultural and manufacturing employment has been measured as the percentage decline and the percentage rise in the respective series, measured from peak to trough ($X_p - X_t / X_p$) and trough to peak ($X_p - X_t / X_t$). The few States whose points do not correspond to the three national cycles under study have been included for the sake of completeness by measuring their percentage changes between reference cycle dates of the NBER. The supposition is that the several States not experiencing cyclical declines during national contractions do experience lesser rates of expansion. This procedure allows comparisons to be made among all continental States (except the nonagricultural series for Idaho, in which the variations are so erractic as to be unrelated to business cycles).

The results of the statistical analysis are presented in Tables 7 and 8 for nonagricultural employment, and Tables 9 and 10 for manufacturing. There is wide divergence among States in the amplitude of cyclical change. Because cycles of different magnitude as well as different States are being compared, the rank standing of each State during periods of expansion and contraction are shown. Such rankings show the relative position and change in standing of each State during each of the postwar business cycles.

No one could expect that each State would maintain its precise rank position in each business cycle. Each experience has its unique properties, and this distinctiveness alone would lead one to expect that the cyclical rank of a given State would vary. In addition, States are changing in industrial composition; therefore, their responses to exogeneous factors would likely differ even if the character of the forces exerted upon them was unchanged. The rankings of States do indeed show variability. But this should not conceal from our attention a fairly good persistence of position. In order to summarize, for each of the three expansions and contractions, the standing of States over the whole period 1947-1960, the average rank during cycle phases has been computed.

Since many States show considerable variability in ranking, it seemed worthwhile to provide a statistical test to determine if there was such great variability in rank position that the results could be ascribed to chance. The result was clearly negative--the rankings were significant on a statistical basis. 9/

The much greater severity of cyclical contractions in Northeastern States is obvious. Rhode Island, Michigan, Pennsylvania, Ohio, Indiana and West Virginia take top billing as crisis States during recessions, as judged from changes in nonagricultural employment. The manufacturing series, which shows greater amplitude changes, also clearly identifies the Northeastern States as especially sensitive to cyclical declines.

A further impression of the severity of State cyclical movements can be shown by simply averaging the percentage changes in each cycle phase. Charts 3 and 4 present these results graphically.

The principal conclusion offered from the present study regarding the severity of regional business cycles in the United States is that contractions are most severe in the industrial Northeastern States--specifically the lower New England States, the Middle Atlantic and East North Central regions, and the border States of West Virginia and Kentucky. Measured in terms of percentage changes in employment, these areas are most sensitive to business cycle contractions. These States, of course, are heavily populated and, therefore, carry especially heavy weight in moulding the course of national business cycles. The States throughout the South (excepting Alabama), the Southwest, and most of the Western States have contractions of much milder amplitudes.

Comparison with Previous Studies

These findings are not in close general agreement with earlier studies. Frank Hanna, in his State Income Differentials, presents "sensitivity" indexes indicating that New England, Middle Atlantic, and Southern States have cyclical swings greater than the national average, while he reports the North Central, South Central, and Western States have narrower cyclical movements.

9/ The average rank is defined as the ranking of the sum of the ranks of each State during the three periods of expansion, and the three periods of contraction respectively. A test of the significance and stability of rankings was taken from Moroney, M. J., Facts from Figures, p. 337ff. The coefficient of concordance, W, for each series was as follows:

	Nonagric. Empl.	Mfg. Empl.
Contractions	0.623	0.625
Expansions	0.551	0.650

With the degrees of freedom (3 cycle phases, 48 States) the F values are all significant at better than the .001 level.

Rutledge Vining drew still different conclusions. He found the South, the Plains, and the Mountain States to be exposed most to cyclical hardships. He concludes:

> "The poorer regions within the nation make up the bulk of the areas exhibiting more violent cyclical fluctuations. The reason for this, however, is not hard to find. These less wealthy areas happen to be 'colonial' stretches that yield up the extractive raw materials that are processed in the manufacturing areas. They are also highly specialized in their production so that imports and exports represent relatively high proportions of total income."

According to his measures, the Northeastern States are quite stable cyclically:

> " . . . these populous areas are economically relatively diversified and self sufficing and produce externally marketed products with income elasticities that are low relative to the elasticities characterizing the agricultural and mineral raw materials. All of this means a milder business fluctuation."10/

While Vining and Hannah have both marked the South, the Southwest, and the Plains States as manifesting severe cycles, Simpson reports he could discern no particular pattern in the severity of cycles among States; and that ". . . if there is any simple dividing principle, it is that of growth . . ."11/ Setting aside for the moment the correlates of severity, I find my measures at considerable variance from those of Simpson. For example, his "index of recession severity" would place five of the New England States on the fortunate side of the record, while my rankings suggest all of them experience rather sharp recessions.

The measures of business cycle severity used by Vining, Hannah, and Simpson differ significantly from those employed in this study. Vining, Hannah, and Simpson measured fluctuation in income; their evidence is based on annual data; their measures are either trend corrected or ratio-to-prior year relatives; except for Simpson, expansions and contractions are averaged. These techniques of measurement differ from the typical NBER approach, and can plausibly produce significantly different conclusions.

10/ Hanna, Frank A., State Income Differentials. Duke University Press, (Durham, N.C.), 1959, O. 64pp.

11/ Simpson, Paul B. "Post War Recessions and State Income Variations," unpublished paper presented at a seminar at the University of Washington College of Business Administration in 1961.

A study that adheres more closely to the results shown in Tables 9 and 10 is the NBER study of George Borts.12/ His material dealt with cycles in manufacturing employment in 33 States for the period 1914-1953. For the most part he relied on annual data, but followed NBER cycle concepts. When adjusted for coverage, the State rankings in this study are fairly close to those of Borts, with a coefficient of correlation of +.61. This agreement is appreciated more when the rankings in this study are compared with those of Hannah; my rank indexes of recession severity in nonagricultural employment are inversely related to Hannah's indexes of personal income sensitivity (a ranking coefficient of .33 NEGATIVE).

Correlates with Business Cycle Amplitudes

Relation between magnitudes of contraction and expansion

In view of the widespread belief that ". . . the bigger the boom, the worse the bust . . . ," it seemed worthwhile to make a comparison of the average magnitude of State expansions compared to amplitude of contractions. In Chart 5, States are arrayed according to average severity in decline together with their average rise during expansions. It seems fair to conclude that the magnitude of expansions is not closely associated with the severity of contractions; other factors than expansion rates need to be examined to account for wide differences in the amplitude of cyclical declines.

Growth factors

Economic growth is closely related to business cycles. It is important to ask whether the differential amplitude of contractions and expansions can be explained by differing growth rates among States. One view, expressed by Steiner, is that rapid population growth, speculative investment, and excessive optimism in rapidly expanding areas produce an environment which is especially sensitive to business cycles. On the other hand, Vining argues that fast growing areas exhibit less sensitivity to the downward swing because of their preponderance of growth industries, their more technically and economically efficient new equipment, and more progressive outlook of new firms.

To test the relationship between growth and recessions, I compared the ranks of State growth rates in nonagricultural employment between 1949 and 1959 with their average rank in cyclical contraction. I found that States having strong contractions generally have low rates of growth (R = -.54, significant at .001 level); States having strong expansions tend to have high growth rates (R = .50, significant at .001 level). Table 11 identifies the 12 fastest and and slowest growing States and their ranks in cycle phases. It is evident that

---

12/ Borts, George H., Regional Cycles of Manufacturing Employment in the United States, 1914-1953. Occasional Paper 73, National Bureau of Economic Research, Inc. (1960).

faster growing States achieve the rates of growth they experience not only through the more rapid gains made during periods of expansion, but by doing better in holding on to what they have during periods of contraction.

Income levels

What kind of relationship exists between income levels and business cycles? Dr. Vining explained the alleged greater cyclical sensitivity of the South-Plains-Mountain areas by their low average income and very high marginal consumption propensities. Hannah, too, found that States having higher per capita incomes tend to be less sensitive to cyclical change than low income States. The present findings are quite the opposite--as might be expected because of the conflicting amplitude rankings earlier discussed. The relationship between the ranks of States during contractions and the ranks of States on a per capita income basis is inverse (R = -.31, significant at .01 level); that is, states with higher levels of income tend to have relatively more severe contractions. These States also tend to have milder expansions, though the strength of this relationship is very weak (R = .08).

Industrial composition

Industrial composition is a significant factor in the explanation of business cycle behavior. To test the hypothesis that regions specializing in the production of investment goods are more sensitive to declines, I ranked States according to the proportion of manufacturing employment in durable goods industries during the years 1957-59 average. These rankings were then correlated with the ranks of States in declines and expansions. As might be expected there is a significant relationship between the severity of contractions and the proportion of manufacturing employment in durable goods; R = .46. The relationship to expansion ranks is even stronger, with R = .55.

Another test was made to ascertain the relationship between industrial diversity and cycles. No measures of the relative diversity of States in respect to manufacturing composition being available, I concocted a rough measure based on the proportion of manufacturing employment accounted for by the four largest two-digit SIC industry groups in each State; States were then ranked according to these proportions. The rankings place South Dakota as least diversified, with 89 percent of its manufacturing employment accounted for by its four largest two-digit industries. The most diversified State by this criterion is Delaware with but one-third of its manufacturing employment found in the four largest SIC groups. No allowance has been made for the size of the States in these computations.

Perhaps a more carefully constructed index of diversity might modify the conclusions, but on the basis of the diversity measure used it appears that the more diversified regions tend to have somewhat more severe contractions. The East North Central, Middle Atlantic, and New England States are fairly diversified, yet have sharp recessions. On the other hand, there seems to be little association between diversity and the strength of cyclical expansions. (The values of R are .24 and .02 respectively).

Conclusions

The major conclusions drawn from this empirical examination of State cycles in employment follow:

1. Business cycles are spatially pervasive in the United States, with almost all States having specific cycles roughly corresponding in time to national business cycles.

2. The distribution of State turning points about the national average, while showing a decided clustering, also indicates that some States have specific cycle turning points quite a number of months ahead of or behind the national turning points.

3. Only a few States regularly lead or lag the turning points in national cycles. Southern States manifest a tendency to lead a recovery and to lag at downturns, suggesting that this region has peculiarly strong stabilizing tendencies during national business cycles.

4. Decided differences exist among States in respect to amplitude changes experienced during specific cycles, and these differences persist from cycle to cycle.

5. Contractions are most severe in the industrial Northeastern States--the lower New England States, the Middle Atlantic and East North Central regions, and the border States of West Virginia and Kentucky. The States through the South, the Southwest, and most of the Western States have contractions of much milder amplitudes.

6. States having more severe contractions are not strongly correlated with those having strong expansions. Most of the Western States and a scatter of contraction-prone States in the North Central region have strong expansions. South and Southwestern States, distinctive for the mildness of their contractions, are found in the middle of an array when all States are ranked by increase during expansions. Factors other than the strength of a boom are needed to explain the severity of a contraction.

7. States having more rapid growth rates tend to have strong expansions and weak contractions; States having slow growth rates have weak expansions and severe contractions.

8. Diversification in terms of 2-digit SIC manufacturing groups is no shield against severe contractions; by this criterion, the industrialized Northeast is highly diversified but has more severe recessions. There is no statistically significant association between diversity and expansions.

9. There is a significant relationship between the severity of cycles and the proportion of a State's manufacturing employment devoted to the production of durable goods.

10. Finally, the test of the relationship between income levels and cyclical behavior indicates that States having above average income per capita have more severe contractions, while the economically poor States tend to have mild contractions. Although there is a slight tendency for States having high income to experience greater expansions, the relationship is not statistically significant.

Note: Average percentage decline in three cycles measured by the simple arithmetic average of the percentage fall from peak to trough, in the specific cycle contractions of 1948-49, 1953-54 and 1957-58. In the absence of corresponding specific cycles in a state series the percentage change between reference cycle dates was included in each state average. In Florida and New Mexico the average percentage change during these three recessions combined is positive. See text for further comment.

$\bar{x}$ = 13.43
x = 4.25
Based on unweighted average of three post-war expansions and three post-war contractions. In the absence of a cycle in a state the percentage change in nonagricultural employment between reference cycle dates was incorporated into the average. In Florida and New Mexico this procedure indicated an average rise in nonagricultural employment during three national recessions.

Table 3

Dates of Peaks and Troughs in National Cycles, United States, 1948-1961

	Reference Cycle Dates of NBER	Nonagricultural Employment	Manufacturing Employment
Peak	November, 1948	July, 1948	July, 1948
Trough	October, 1949	October, 1949	October, 1949
Peak	July, 1953	May, 1953	May, 1953
Trough	August, 1954	August, 1954	September, 1954
Peak	July, 1957	March, 1957	March, 1957
Trough	April, 1958	April, 1958	May, 1958
Peak	May, 1960	April, 1960	February, 1960
Trough	February, 1961	February, 1961	February, 1961

Sources: Peaks and troughs of NBER reference cycles from Business Cycle Developments, p. 61.
Turning points in employment data determined by inspection from seasonally adjusted series published in Employment and Earnings For the United States, 1909-60, Bulletin No. 1312, Bureau of Labor Statistics, p. 474-475.

Table 4

Distribution of the turning points in
State cycle from the national cycle (in months)*

Nonagricultural employment

Troughs	M.D.	Range	Peaks	M.D.	Range
1949	2.2	14	1948	2.6	15
1954	2.6	13	1953	2.3	12
1958	2.4	23	1957	4.0	18
			1960	1.0	12

Manufacturing employment

1949	2.0	13	1948	3.3	15
1954	3.0	15	1953	2.2	10
1958	2.3	16	1957	5.8	19
			1960	4.0	20

* Dispersion (mean deviation, range) measured from the peaks and troughs in the national cycles cited in prior table.

Table 5

Leading and Lagging States in Nonagricultural Employment

Rank of Growth Rate*	Rank of cyclical severity in: Expansion	Rank of cyclical severity in: Contraction	TROUGHS	1949	1954	1958	
				(Lead (-) or lag (+) in months)

Weak States	16.1	23.2

INTERPRETING ECONOMIC STATISTICS
CONNECTICUT LABOR COMMISSIONER'S ECONOMIC ADVISORY GROUP

Raymond F. Sabatella, Jr.
Market Research Director
Hartford National Bank

My task today is to talk about what we consider to be a rather unique group --namely, the State Labor Commissioner's Economic Advisory Group of which I have the privilege of serving as Chairman this year. As in anything else, the group was formed to satisfy particular needs--in this case the need for economic intelligence on the part of the members, as well as the needs, we feel, of the State Labor Department itself. For the next few minutes, I would like to relate some of the developments that led to formation of this useful association of economists and business analysts, then a little bit about what our function is.

One of the frustrations of a business analyst or economist concerned with the study of economic developments in his own State, or in the market area served by his company, is the lack of a single source of comprehensive economic data offered on a continuing basis which lend themselves to sophisticated analyses. While data are often available in considerable detail at the national level, too seldom are they available in useful form at the State level; and when they are, they are often difficult to reconcile with national or regional statistics.

Labor Department Source of Data

Here in Connecticut, as in any State, the private economist, in his attempt to satisfy the requirements of his own company, is posed with the problem of gathering a host of diverse statistics on income, output, and employment. While much of the data were available, they were available only from a variety of sources, seldom compatible with other reporting methods, were either on an annual or monthly basis (but not both), seldom seasonally adjusted, and hardly ever useful in tracing meaningful trends or projecting future developments. About the only economic facts readily available on a monthly basis which lent themselves to reasonable analysis were employment statistics compiled by the State Labor Department. And so, in any attempt to paint a picture of the domestic economy, we in private business found ourselves compelled to use this information as the best and most comprehensive available on the local scene.

Economic Indicators

Naturally, we were delighted when the State Labor Department adopted new methods and techniques developed by the National Bureau of Economic Research and decided to publish a monthly release called "Connecticut Economic Indicators? --and to present both actual and seasonally adjusted data in order to enhance their usefulness in analyzing cyclical expansions and contractions and to facilitate their comparability with data compiled by other States and for the nation as a whole. These indicators were expanded after 1963 to include not only employment information, but figures for new incorporations, manufacturing output, bank debits, life insurance sales, electric power sales, new car registrations and personal income on a comparable reporting basis.

The number of different series reported was based upon data which were available, but previously not reported publicly, since there had been no well defined evidence of regular need or use. The new data, however, permitted appropriate seasonal adjustments and reasonably accurate analysis. It was only natural, therefore, that the State Labor Department, which published these data monthly, simultaneously with historical trends, would become the prime source of regular intelligence concerning economic trends within the State. And I might add that we in private business found ourselves calling the State Labor Department regularly for information in hopes that we could relate these data to the development of trends in our own business.

Informal Group

There is, as you know, often a wealth of information compiled at various sources, but not widely used. As a result, David Pinsky, who is the guiding force behind the development of the Economic Indicators in Connecticut called together a group of private economists whom he felt were making regular use of the information being assembled by the State Labor Department in hopes of getting our ideas on how this information might be used, how it might be analyzed or how it might be improved or expanded. For several months this group met informally at the Labor Department to discuss amongst themselves what these figures indicated for the future of the Connecticut economy as well as for certain areas of Connecticut, and attempted to relate them to trends at the national level. At the close of these sessions we were almost always in agreement about what the figures indicated and we felt that it might desirable to put our opinions on a piece of paper as an expression of a consensus amongst economists representing various aspects of the Connecticut economy.

Quarterly Meetings

It was then suggested that we submit our views on a quarterly basis to the State Labor Commissioner for his consideration and disposition. We felt that the Labor Commissioner might welcome an outside interpretation of the data and a comment on the business outlook suggested by the figures. The response has been gratifying and we are confident that the interchange of analytical knowledge from those who compiled the numbers and those who make considerable use of them has been mutually beneficial. The Labor Commissioner has indicated that he finds these reviews submitted by private business to be of considerable use of them has been mutually beneficial. The Labor Commissioner has indicated that he finds these reviews submitted by private business to be of considerable value and of useful guidance. Our group continues to meet quarterly, and, to our knowledge is not only unique among the States, but happens to be the first informal association of economists in Connecticut. I might add that the economic indicators published by the State Labor Department each month, together with historical data, are as valuable to me in analyzing the local scene as the economic indicators published monthly by the Department of Commerce are in painting a picture of the national scene.

Use of Data

This leads me to a brief word on how we in the business community utilize the statistics provided by the State Labor Department, which relates back to a statement I made earlier that there is a myriad of information compiled in various sources which is seldom put to good use. As a banker, I can assure you that every single series which now comprises the Connecticut Economic Indicators is particularly useful to me in assessing and projecting our own growth--projections which are necessary in order for us to make appropriate future plans. But these same statistics are equally useful to others.

We are fortunate to have both a series of coinciding indicators--those which tend to relate current developments--and a series of leading indicators which tend to foretell economic trends over the near future. I will not belabor you with a lot of unnecessary comment on what the coinciding indicators tell us, because I think they are self-explanatory. The coinciding indicators include such things as: nonagricultural employment, the rate of unemployment, the manufacturing output index, bank debits, life insurance sales, new car registrations, electric power sales and personal income.

Reliance on Leading Indicators

Although we are concerned with the recent and present profile of Connecticut business, we are always mindful of what the future holds. To that end, we place considerable reliance on six important leading indicators. One is the average workweek in manufacturing. As you know, many factories, even before cutting back on the number employed, tend to reduce the number of hours worked by its production line personnel. This generally would suggest, assuming the downward trend persists for 3 or 4 months even while your coinciding indicators were still rising, that new order volume might well be diminishing. Movements in the average workweek are generally followed by--or associated with-- movements in the number of weekly claims for unemployment insurance and in the new hiring rate in manufacturing, as well as movements in the number of job openings reported by the Labor Department--each of which is also classified as a leading indicator and all of which have tended to move up or down in the postwar period in advance of similar movements in the roughly coinciding indicators. In fact, over most of the postwar period, a drop in the leading indicators has proceeded by 6 months or more a noticeable decline in those indicators which best describe current economic trends--particularly employment and factory output. Moreover, these indicators have tended to level off well in advance of the low point in the postwar business cycles and were subsequently followed, in a few months, not only by an upward movement in the leading indicators themselves, but also by a general business recovery on the broad front. In short, while these indicators have only been published now for about 2 years, we in the business community have seen evidence of their forecasting powers and tend to watch them very closely when making projections for the performance of our own particular businesses and for the Connecticut economy as a whole. And because Connecticut is a highly industrialized State whose business swings are more promounced than those at the national level, we are even more mindful of any movement whatever in the leading indicators.

Anyone familiar with what leading indicators are supposed to do might suggest that what I have been talking about for the past few minutes or so might be somewhat academic--particularly if you have been following business cycle developments set forth by either the Department of Commerce or the National Bureau when reporting national trends. The important point here is that a useful service is now provided to the business community by our State Labor Department--a service which is gaining wider acceptance and more frequent use by the private sector.

Commissioner's Mandate

Most of you here at this conference are concerned primarily with the gathering and disseminating of labor statistics for your respective States. You have probably often wondered to what use your fact gathering has been put, aside from the requirement that labor statistics must be kept in compliance with certain legislation or directives. I am sure you will all agree that labor statistics are often a reflection of developments in other areas of economic activity and that in isolation can be useful in telling only part of the economic story. But adopting indicators of business activity other than labor statistics per se--and particularly the adoption of leading indicators--can be a useful mechanism for anticipating trends in the labor statistics themselves. Clearly, a reasonable examination of the future based on existing facts has immeasurable value whereby foreknowledge might well bring about a smoother application of stand-by assistance programs. And this type of complimentary fact gathering seems consistent with a legislative mandate of 1885 which says "The Labor Commissioner shall collect information upon the subject of labor, its relation to capital, the earnings of laboring men and the means of promoting their material, social, intellectual and moral prosperity."

In the process of complying with that mandate, the Connecticut State Labor Department has provided an invaluable service not only for the Connecticut business community, but for the State as a whole.

Economic Advisory Group Report

In return, we feel that our Economic Advisory Group here in this State also provides a service to the State Labor Commissioner. For one thing, he has the benefit of independent thinking, substantiated by a written report every 3 months which is submitted to him by the Chairman of this group. These opinions concerning the business outlook are not seriously circumscribed or inhibited since we in the private business world have more license to make public statements about business conditions than is generally granted to government agencies.

I have implied that this group is always in agreement on what the indicators show with regard to current trends and what they imply with respect to future prospects for the Connecticut economy. While this may be an oversimplification, we have, I think, been more unanimously in agreement on these matters than would ordinarily be the case for most groups who represent varied sectors of the economy. I suspect that, in large part, this agreement--thus far at least--reflects the value of the statistics themselves, the patience with which

they are collected, the straightforwardness with which they are presented and in the knowledge of the manner in which they are gathered. For the most part, this has resulted from the close working relationship and free interchange of ideas between the State Labor Department and the Labor Commissioner's Economic Advisory Group. If such a useful association has not been initiated in other States, then I would strongly urge that it be done. The benefits to be derived from this mutual exchange are manifested in a better knowledge of the economy in which we live and will ultimately lead to more intelligent proposals to make it even better.

CHAIRMAN CABE: We have a few minutes available for questions to any of these people on the rostrum; would you like to address your questions?

MR. BOURQUE: I have a question of the other speakers who mentioned the use of State leading indicators, and it is a question of the State leading indicators being better indicators of economic change in the State than the national leading indicators or a national forecast viewing of the State as part of the national economy.

Do the leading indicators in a State, for example, for the average workweek, lead the national leading indicators, and might these then be useful for forecasting what the national forecasting indicators are going to do?

MR. STARK: I would like to make a comment on it.

As far as I know from observation, the thing we have failed to do is analyze the data sufficiently to permit a good answer to your question.

Secondly, when you pick hours as the measure, I think the structural changes in the economy, and other changes that I cannot pretend to understand, suggest that hours may not be as sensitive in many respects as we had formerly thought. There are frequently changes in the economy that hours do not reflect as well as they used to. There is something going on about the character of hours that might make that particular illustration difficult to answer.

The point that you raised is exactly the one that I think motivated Gerhard Bry's original report. He wanted to find out whether certain States, or data in certain States, give an advance indication of the national movement. That was what he was looking for, and thus far we have not found it. I would say that probably the answer is no.

But, more importantly, I would say that the justification for those in the State and particularly for the State labor departments is we are not tring to anticipate national movements. What we are trying to do, is understand the economies of particular States.

It is much more important than an academic study of business cycle analysis as far as the organizational aspect for State labor departments. In this sense, I would say both answers would be "no."

MR. SABATELLA: You have to analyze national as well as State. After all, the national figures are much more than a reflection of the developments in regions. I think there is sufficient difference in the timing of troughs and peaks; I do not know whether we hit the low point at the same time.

The national indicators are nothing more really than a conglomeration of all the various statistics gathered over all parts of the country, so I think that the State figures offer a degree of refinement in the locality which you have under close consideration. I know in private business here in Connecticut and in most other States we are keenly interested in not only what the national figures show, but what the State figures show to the extent that they might tell us something about our area in advance of what the national picture might be leading to. More importantly, it is not always the case when the country is in somewhat of a recessed business cycle that a particular area or State necessarily has to be.

Here in Connecticut, as many know, we are more responsive to changes in cycles. Our upswings are sharper and our downswings are sharper in private business. The BLS and the Department of Commerce perhaps are somewhat less interested in reporting or analyzing it quite that way; I am not sure.

MR. SOULE: I do not know how appropriate this is, but when we say there was a national recession, say, in 1960 and 1961, I believe we are referring mainly to Gross National Product.

We do not have these for the States. When we say we have a leading indicator for the State, we mean that that leads the national recession. We do not have the vaguest idea whether it leads the State of Kentucky's recession because we do not have a measure of that. I would like to point that out.

MR. CHARLES A. ROUMASSET: I realize that this may be a bit unethical, but I would like to have Dr. Bourque answer his own question.

As I gathered it, you made a study of the coincident indicators. I would like to ask if you have ever done anything with the leading indicators on the same basis?

MR. BOURQUE: The answer is "no." We have chosen to analyze the manufacturing series and the nonagricultural employment series because these are both coincident indicators nationally.

One of the questions we sought to find an answer to is even though these are coincident indicators nationally, are these on a State basis coincident with the national indicators? That is, are business cycles, national business cycles, universally shared among States? Are they approximately of the same amplitude or different amplitudes, and if so, how different, and if their timing is different, how different is the timing?

We did find that there are a number of States that do have consistent turning points in nonagricultural employment, in manufacturing employment, and are in advance of the national turning points so that these States may be of some value in forecasting nationally as well as being of value for analyzing the position of the individual States themselves.

But, our concern was mainly with what is the ongoing structure in the diversified economies composed of many States?

Mr. Sabatella was quite right, that national business cycles are a composite of behavior in many different areas. It is pretty important to know what the composite looks like in understanding the meaning of the national aggregate.

MR. LEROY DUNN: A study some years ago on postwar business cycles seemed to demonstrate that the major destabilizing influence in the postwar cycle certainly was the military component.

You come from a State that is rather heavily reliant on military contracts, and Charles Thibeault of your own university, I know, is working on the regional cycle and the impact of disarmament on that cycle.

Here in the State of Connecticut, we are similarly concerned. I think one-third of the manufacturing employment is in defense-related industries, and I wonder whether you in your own investigation had examined some of these quotations from Hickman, and if so, could we learn something about the source of the cycle?

MR. BOURQUE: The State of Washington and the State of Connecticut have a good deal in common. We produce aircraft, and you produce engines, and I imagine there is a good deal of similarity in the irregular fluctuations that occur.

The State of Washington has irregular movements, that is, noncyclical type movements, that are related to government defense spending. At several times, this has resulted in good fortune for the State, but by and large the State still has ups and downs that conform to the national business cycles, and I am not quite suggesting that one could look at the series in the State of Washington and conclude what the national business cycles were by looking at the State of Washington alone, but there is a pretty good concurrence in the fluctuations despite the fact that the military expenditures in the aircraft industry play such an important part in the State of Washington.

MR. LEROY DUNN: Have there been any similar studies done on behalf of the State of Washington? I do not want to prolong this, but subsequent to the one that come out a year or so ago?

MR. BOURQUE: As far as I know, there has been no detailed study of the business cycles in the State of Washington or business cycles in the State of Washington related to defense expenditures. Hickman touches, of course, most generally upon it without getting into regional considerations. I think it would be a most interesting study to relate our cycles in Federal spending to specific areas, but perhaps one of the reasons that it is not done is our individual areas experience cycles that are in conformity to the national cycle.

Even in the State of Washington, I think a very substantial portion of the labor force is engaged by Boeing Company. This does not provide a shield, nor does it make a decisive difference. It makes a difference, but you can still pick out the cycles that correspond to the national cycles. Even in the northwest corner, we are still very much interested in the national cycle because we feel a part of it.

Productivity and Automation

Comments on Current Situation and Outlook

John W. Kendrick, Professor of Economics
University of Connecticut

I was pleased to hear Mr. Soule mention Wesley Mitchell, the godfather of the National Bureau of Economic Research, with which I am at the present time associated. Back before World War I, Wesley Mitchell developed a theory which later has been more or less confirmed by statistics and has since been developed. I would like very briefly to outline Mitchell's approach which I think is quite helpful as a framework for looking at the current economic situation, with particular respect to productivity.

In this theoretical framework, productivity is one of several variables which are quite important in determining the turning points of the business cycle. The first part of Mitchell's approach was his hypothesis, later confirmed by Thor Hultgren and others at the National Bureau, that productivity--defining for the moment productivity as output per man-hour--tends to rise rather rapidly in the early phase of expansion of the business cycle as fuller use is made of productive capacity, and as we approach more closely an optimum combination of resources; but in the latter phase of the business cycle, the advance of productivity tends to slow down as bottlenecks develop when production exceeds the most efficient rate of utilization of capacity in some industries. In early recession, productivity advances even more slowly and sometimes declines, but in latter recession, with strong incentives for increasing efficiency, productivity tends to start rising more rapidly again before the lower turning point.

The second variable that one has to link with productivity to get an idea what is happening to labor cost per unit of output is the wage rate or, more broadly, average hourly earnings. This development in expansion is more or less the reverse of the movement of productivity; that is, wage rates or average hourly earnings tend to rise more slowly in the early phase of expansion but, as unemployment is reduced and as labor is in a better bargaining position, average hourly earnings tend to rise more rapidly in the latter phase of expansion and in the early phase of contraction. With rising unemployment, wage rate increases tend to slow down in the latter phase of contraction.

Now, unit labor cost, as we all know, is merely the quotient of average hourly earnings and of output per man-hour, so what happens to unit labor cost is already implied by what I have said: It actually falls in the early phase of expansion or goes more or less sideways as productivity advance exceeds or equals the increase in wage rates. However, unit labor cost tends to rise in the latter phase of expansion as wage rates go ahead somewhat faster and productivity begins to slow down.

This more rapid increase in unit labor cost continues into the early phase of contraction and then sloughs off in the latter phase, with possibly an actual decline in unit labor cost as productivity advance picks up again and increases faster than average hourly earnings. I am referring to the average, typical business cycle.

The significance of all of this is in the relationship of unit labor cost to prices. In the early phase of expansion with possible declines in unit labor cost as volume increases, profit rates and total profits go up, but in the latter phase of expansion with unit labor costs rising more than prices, obviously profit margins begin to get squeezed.

This is, of course, where the significance of Chairman Martin's remarks comes in. If the monetary authorities begin tightening credit, making it more difficult for cost increases to be passed on through price increases, it is probable that there will be some squeeze of profit margins. The National Bureau has found that profits tend to be a leading indicator; that is, the profit ratio either to sales or to assets (the rate of return on investment) tends to turn down before the peak of the business cycle. This leads to a drop in new orders for equipment and in construction contracts with a later decline in investment outlays, actually pulling down total demand through its multiplier effect on consumption.

Conversely, the improvement of profit margins in the latter phase of contraction tends to foreshadow some increase in new orders and construction contract awards, which lead to an increase in investments which by their multiplier effect increase income, and the ground is laid for a new expansion.

With this analytical framework which I think is very useful in looking at the current business situation, let me say a few words about where we seem to stand at the present time, although it is difficult to know the position of some of these variables. I was telling Jerry Mark, before the meeting, that one thing I would like to see is the development of quarterly figures on productivity. I think that with our increased ability to adjust for seasonal fluctuations we could get a meaningful series. Nevertheless, despite the lack of official statistics, I did the best I could with real GNP, total employment and hours figures for the economy, and for manufacturing.

It appears that whereas productivity has increased from 1960 to 1964 at pretty much the postwar trend rate of around 3.2 percent or so, in early 1965 there are definite signs of productivity advances slowing down. On the other hand, there are indications that the rate of increase in average hourly earnings and wage rates is beginning to pick up somewhat. The U.A.W. contract and some of the other recent labor contracts suggest that there is some acceleration in the rate of gain in wage rates.

It has not shown up yet in Business Cycle Developments, but I would not be surprised if the figures for the second quarter, which are not yet available, will show some tendency for unit labor costs to begin to increase faster than prices. We already know that price rises are beginning to accelerate somewhat; this is one of the reasons for Martin's concern and the concern of the Council of Economic Advisers.

I think the thing to look for over the rest of the year is whether this increase in unit labor cost develops and continues and whether the Federal Reserve Board tightens credit further--we are already down to a point of no free reserves. There are indications of tightening bank rates here and there, so it seems to be quite possible that there will be a general tightening, although this will depend on the outcome of the dialogue within policy councils in Washington. If there is credit tightening, and if the price increases do not keep up with increase in unit labor cost (which in the economy as a whole is the largest element of cost), I think that later in the year we could get some squeeze on profit margins, some reduction in rate of return, which with some lag would tend to be followed by a reduction in new investments, assuming profit margins are reduced below the point at which new investment is as attractive to business as it is presently.

So far, there are just very early indications of this type of development. I think it is quite possible that things develop in this way as they have in many previous past cycles, and it is quite possible that we will have a mild contraction some time in 1966. However, no one can forecast this, particularly in the face of substantial increases in defense spending. Definitely, at this point, the leading indicators do not indicate a recession in the near future. It is just a distinct possibility, as I see it.

I certainly do not share the optimism of the 1965 Economic Report of the President that the cycle may be a thing of the past. I agree with Chairman Martin that we must be alert to possible unfavorable developments. However, I do think that his statement that there are important similarities with 1929 should not be interpreted to indicate that we are in for a severe recession. We all know the great differences in our economy now as compared with then. If a recession develops during the coming year and a half, I think it will be mild like most of the postwar recessions. Then we will start another expansion, in the later 1960's, which I believe will be a very strong expansion, propelled by the rising tide of family formation.

CHAIRMAN CABE: Jerome Mark, the Deputy Assistant Commissioner for Productivity and Technological Developments for the BLS is here, and he will talk about the impacts on employment. Actually, I should say he is going to be talking about the productivity program of the Bureau of Labor Statistics.

DEVELOPMENTS IN FEDERAL STATISTICS AND RESEARCH ON PRODUCTIVITY AND EMPLOYMENT

Jerome A. Mark, Deputy Assistant Commissioner
for Productivity and Technological Developments
Bureau of Labor Statistics, U.S. Department of Labor

I would like to talk to you about some of the work of the Bureau of Labor Statistics on the relationship between productivity and employment. In describing this work, I would like to approach it from two angles: First, our work in trying to assess what has been happening; second, our work on what we think is likely to happen in the next few years. The two are closely related, but for convenience of presentation, since the emphasis differs, I will make the distinction.

First, on productivity measurement itself, the basis for ascertaining any relationships between productivity and employment: earlier this year we extended the measures of output per man-hour for the private economy and major sectors through 1964. In this extension, we also revised and reintroduced the measures for manufacturing and nonmanufacturing, which had not been published for several years. The figures show that we have been maintaining an annual rate of growth in output per man-hour of 3.3 percent for the last 5 years and 3 percent for the entire postwar period. Both manufacturing and nonmanufacturing have shown significant gains over the last 5 years. Manufacturing experienced a rate of 3.2 percent per year over the last 5 years in contrast to 2.5 percent for the whole pastwar period. These rates for nonmanufacturing were 2.9 percent and 2.5 percent, respectively.

We also develop measures for selected industries, some of which are not published because of data limitations, although still used for analytical purposes. Our plans are to develop for publication measures covering all industries with 50,000 or more employees. If necessary, because of limitations in annual data, some of these might have to be restricted to years of economic censuses.

These two sets of output per man-hour measures form the basis for analytical work on the relationships between productivity, output, and employment. We recognize these measures have limitations as indicators of technological change alone, since they are affected by other factors such as scale of operations, rate of investment, quality of raw materials, etc. They are, nevertheless, heavily affected by automation or technological change, and some of the other factors, such as organization of work, are often directly tied in with the introduction of new equipment and new technology.

Overall Analysis

On an overall basis--for the private economy and major sectors--we have been examining productivity and output relationships in order to derive some of the implications for employment. As have many others, we have found that little or no correlation can be derived directly between annual changes in employment and productivity. We have, therefore, been asking these questions: Has productivity been increasing relative to output, so that it is resulting in decreased or smaller increases in employment? If there is a relationship, it is stable for long-run or short-run periods; and does the change in productivity bear a constant relationship to the change in output, no matter how large or how small the output change?

The various measures we have for the private economy and major sectors over the past half century have been examined and relationships over selected time periods such as 1909-47, 1919-47, 1947-63, derived. The findings from this work were presented in Leon Greenberg's paper for the OECD Conference last December on Manpower Implications for Automation. I will not go into all of them here except to point out that one of the findings was that although the rate of increase in productivity in the postwar period 1947-63 was higher than in the long-term period 1909-64, there does not appear to be a substantial difference in terms of relationship between productivity and output for the

private economy as a whole. Because of the similarity of these relationships, employed man-hours changed at about the same average rate during both periods. In contrast, within the earlier period, during the decade of the 1920's, when the rates of productivity gain in the private economy were about as high as for the postwar period, output went up at a much faster rate--so that man-hours of employment rose at a much faster rate in that decade than during the postwar period.

We are currently extending this work using indexes of year-to-year changes in output per man-hour, output, and employment, but reconverted to 3-year and 5-year moving averages in an attempt to eliminate some of the effects of random year-to-year fluctuations. We plan to cover all possible combinations of years in the period 1909-64. We hope this will provide a more generalized and complete picture of any relationships.

Disemployment Analysis

This aggregate type of analysis does not cover the impact of technological change on worker displacement. Actual job displacement, as distinct from employment, depends on the extent to which productivity gains are or are not matched by output gains at the lowest level of activity. Consequently, a more detailed type of analysis is called for here.

A few years ago, Commissioner Clague and Leon Greenberg presented a paper for the American Assembly in which they attempted to assess the employment affects of technological change as reflected through productivity measures. In their analysis, covering over 200 industries within manufacturing they related unit man-hour changes and employment changes. They estimated what was termed a disemployment figure (the decline in employment associated with the increase in productivity) to separate the employment decline associated with output declines from that associated with productivity increases. Separate analyses were conducted for all employees and for production workers.

This analysis was extended and included as part of the paper by Mr. Greenberg before the OECD Conference last December to cover periods which were characterized by different overall employment and output movements; periods, for example, when overall output per man-hour increased at about the same rate, but output moved differently (such as 1947-57, 1953-59, 1957-62). For the periods when output rose more than productivity, the disemployment associated with productivity increases was less than for the periods when output went up less than productivity. The disemployment figure for all employees was less than that for production workers alone in the period 1953-59, when overall employment decreased. The two figures were approximately equal in the period from 1957-62, when employment increased.

Currently, revised productivity (output per man-hour) indexes using new industry price deflators are being developed for several hundred industries in manufacturing. These measures will be useful to reevaluate the earlier estimates, which were based on less complete deflators. In addition, these indexes will be used for computing 3-year and 5-year moving averages of productivity, output, and employment over the whole postwar period. This would permit analysis of these relationships under varying conditions of productivity and output

change and result in a large body of information on disemployment by industry.

We recognize that this type of analysis is limited in several ways and, in fact, is only an interim step in trying to assess the displacement effect. The figures reflect only net disemployment between industries. They are the net result of changes in employment occurring among many plants--some with increases, others with decreases; and may not reflect the sum total disemployment which took place among all plants. For example, in those industries where employment increased, there were probably plants in which employment declined with productivity increases.

Moreover, in another sense, the analysis may be incomplete because employment declines associated with industry output declines may be in part a reflection of technological substitution of products from other industries. For example, the substitution of natural fibers by synthetic fibers, metals by plastics, etc. This kind of change does not show up in the productivity figures for the industry. As yet, the effect of this change on output and, hence, employment cannot be separated from other factors involving output declines.

In an attempt to meet the first problem, we are currently extending the analysis of disemployment relationships to individual plants. We are using individual establishment data from the Bureau of the Census. Specifically, we are utilizing data which has been assembled by the Bureau of the Census for its "Time Series Project for Manufacturing and Mineral Industries." For this project, the Census Bureau has prepared individual establishment records with basic data on employment, man-hours, value of shipments, value added, etc., for each year for 25 industries carefully matched from 1954 through 1961 and for plants in 15 industries from 1947. We are conducting a pilot investigation of these 15 industries. This work is being done for the National Commission on Technology, Automation, and Economic Progress (the President's Automation Commission) and if successful will be extended to other industries within manufacturing.

Disemployment analysis extended to the plant level can result in an overall disemployment greater, the same, or less than that at the industry level. Work on one of the industries already has shown how important the time period and overall output changes are in this analysis. In this industry, for example, when overall output increased, the between plant disemployment was less than the industry disemployment. When overall output decreased, it was greater.

What this work is showing is that the job of trying to assess the displacement effect of productivity changes on employment is a complicated one. At the same time, it is an important one--to attach some magnitude to the relationship between technological change and employment or disemployment.

The plant data are being explored for another type of analysis--to examine the productivity levels of leading plants in each industry and their relationship to the average productivity of the industry. For this examination, which we call the "best plants practices" study, we rank the plants in each industry by their base year productivity, group them into deciles, and observe which deciles predict future industry productivity levels over time. If this method

proves satisfactory, it will provide, in conjunction with the results from our studies of technological developments, better indications of industry productivity growth and employment implications. In this work, we also try to identify the productivity leaders in the industry to see whether they remain leaders or are replaced by newer plants.

In describing our best plant practices study, I have already touched somewhat on our work with regard to what is likely to happen. I would like to refer now to our two major activities in this area. First, in connection with the Interagency Economic Growth project, we have developed a set of projections of output per man-hour trends for most of the sectors of the economy. This project, as you may know, is to provide a comprehensive framework for analyzing the implications of long-term economic growth for a number of economic problems, such problems of manpower utilization. One element in this framework is productivity change in the various sectors. When related to generated levels of industry output, these productivity projections provide the employment implications of the model by industry. These projections were to the year 1970 and were based on all available data (both published and unpublished) on productivity measures which we could develop. We also attempted to take into account, insofar as possible, the technological outlook in each of the sectors. When tied in with the other elements of the Growth Model, the projections will furnish another aspect of the productivity-employment relationships.

Finally, in order to provide a broad overview of significant technological trends in the economy and their manpower implications, our office prepares a summary report on new types of machinery, processes, and products in key industries which are believed likely to have an important effect on manpower needs over the next 5 to 10 years. The emphasis of the report is on technological developments within each industry in an early stage of commercial use, i.e., the period after introduction on the market but before widespread adoption. This report includes, insofar as possible, estimates of the extent of use today and projected use by 1970 and its importance in terms of the proportion of total man-hours affected and skills and training required.

The first version of this report entitled Technological Trends in 36 Major Industries was issued last year by the President's Advisory Committee on Labor-Management Policy. We are currently revising the report to cover about 40 industries with updated and expanded information. The report will provide information on three important areas about which Department of Labor and the Automation Commission are concerned--the extent and pace of technological change, the kind of occupational and employment changes that may be implied, and the nature of manpower adjustments that are being made.

Some technical innovations have applicability in many industries. Among these are such developments as computers and numerical control of machine tools. Because of their far-reaching impact, in addition to the separate industry analyses, we also develop special studies on the nature of these innovations, dates, prospects for adoption, and implications for labor requirements.

In this resume, I have summarized some of our work on productivity and employment. All of this work in one way or another is aimed at placing the technological change-productivity-employment relationship in a realistic perspective.

MANPOWER IMPLICATIONS OF AUTOMATION--SUMMARY OF CONFERENCE BY ORGANIZATION OF ECONOMIC COOPERATION AND DEVELOPMENT

Howard S. Carpenter, Chief
International Economic Organization
Bureau of International Labor Affairs
U.S. Department of Labor

I believe it is rather unusual to have one Conference hear about another conference, but you can relax a minute and hear how other people have looked at some of the problems we will discuss today.

This is a condensation of a conference sponsored jointly by the OECD, the Department of Labour of Canada, and the U. S. Department of Labor, held at the State Department in Washington in December, 1964.

The speakers and discussants came not only from the U.S. and Canada, but also France, West Germany, Italy, the United Kingdom, and all of the Scandinavian countries. It was a tri-partite conference, with labor and management having an equal share of the program with governments, which were backed up by universities and the research community generally.

A complete analysis of the conference has just been prepared by Professor John Crispo of the University of Toronto and will be available shortly in paperback form published by the OECD and McGraw-Hill.

The U. S. Department of Labor is going to publish next month the papers that were presented by U. S. Department of Labor staff members, and some of the speakers at that conference are present at this one, Dr. Clague, Dr. Francis, Dr. Levine, and some of the others here also attended and participated in the discussions from the floor that enlivened the December meeting.

The purpose of the conference was to range over the entire socio-economic consequences of automation with the greatest emphasis on the impact of automation on job content, working conditions, and broad occupational trends. From this emerged some conclusions as to what can be done both publicly and privately to facilitate manpower adjustments.

Almost every speaker voiced the same concern we heard yesterday morning from Louis Levine, that there is too little information, too few data for the policy-maker to make up his mind on what to do about this. Policy-makers, therefore, all the speakers complained, are being forced to make decisions about automation's impact and what to do about it largely on intuition. The same lack of information, interestingly, applied also to the persons who delivered presentations.

The conference had three main topics, the first was the economic setting for automation.

The pace of automation is quickening and may soon be even more rapid. In one of the most controversial papers presented, Leon Greenberg of BLS examined the rates of productivity changes from 1909 to the present, and I think you might be interested in getting his statement when it gets published next month by the Department of Labor. I might add to what Jerry said that he pointed out that our increasing appetite for services rather than more goods may be one of the important factors holding down increasing productivity rates.

Other speakers and discussants brought up the fact that Mr. Greenberg's paper did not sufficiently dramatize the impact of the drastic effects that occur in those industries where productivity rises are sudden. The great increases in agricultural productivity, for example, they pointed out rendered surplus many members of our farm labor force. Similar increases have drastically cut manpower needs in the oil and chemical industries.

Dr. Clague pointed out, also, that sometimes occupations are hit right across the board, and he pointed out posting clerks and some eighty other declining occupations, some of which are declining because of changing buying tastes of the public rather than for technological reasons.

The second topic covered was collective bargaining and employer personnel policies.

There seemed to be general agreement on the role of collective bargaining in helping to facilitate the adjustment process, particularly in helping preserve the existing jobs temporarily so that time can work its magic. It was felt, however, that collective bargaining could do little to create new job opportunities. Public policies concerning stimulation of demand, occupational retraining, and so forth, must help carry the load that collective bargaining was once able to do.

The structure of both U. S. and Canadian trade unions came in for criticism in respect to their ability to handle the impact of drastic technological change. According to some when an enterprise is being automated, the many craft unions operating within it may not think in overall terms, either in terms of their relations with management or their relations with their own members.

At this point, the Swedish delegation made the point that since both Swedish workers and trade union officials are first of all members of the central L.O., which is equivalent to AFL-CIO headquarters, and only incidentally members or officers of a particular industrial union, neither the workers nor union officials care whether adjustment to automation involves transfers to other industries or other unions.

The conference also brought out the fact that big technological improvements require a change in collective bargaining techniques. No longer can there be last-minute deadlines with confrontations lasting up to midnight, since the tentatively-negotiated accommodations technically require months of preliminary testing before they can be judged and accepted.

Professor Arnold Weber of the University of Chicago pointed out that only after a union has accepted the inevitability of automation can management afford to work with it on the adjustment problems. Conversely, he said, only when management has agreed to write off the costs of employee adjustment against the great gains of introducing automation can unions afford to work with management.

He pointed out also that only when employers agree to give adequate advance notice of their intention to automate, can there be rational negotiations.

Mr. Brooks, of the new Manpower Consultative Service of the Canadian Department of Labour, presented a paper on how his government is now offering facilitating services to aid the collective bargaining process when automation is the subject of negotiations.

Finally, the last topic was facilitating worker adjustment to technological change. Some of the barriers to worker adjustment that were discussed there were mentioned here yesterday by Mr. Bookbinder in the context of anti-poverty programs: lack of basic education and its implications for the inability of persons to face up to the need to accept retraining for new occupations late in life. This was noted as the number one barrier to worker adjustment. This psychological insecurity, which lack of good basic education breeds, also prevents greater geographical mobility in this country.

The question of overcoming these barriers brought a multitude of suggestions from the conference, mostly along the line of a closer mix of academic with vocational training. Professor Charles Myers of MIT stated that every North American from laborer to professional must be inculcated with the idea that he may--and probably will have to--change his occupational career several times during his life. Dr. Dymond of Canada amplified this with a plea for a vocational counselling set-up that would serve everyone from childhood to old age.

This all led the conference into the same recommendation that every conference on automation or manpower that I have attended in the past 25 years always winds up with: that what we need to do is strengthen employment

RESEARCH AND LABOR EDUCATION PROGRAMS IN UNIVERSITIES

John J. Glynn, Director
Labor Education Center
University of Connecticut

I would like to talk very briefly with you about what has been happening in labor education programs in universities and the increase in interest in research in those programs. I am talking now about university labor education in the year 1945. Then we could find in this country only one such program, and that was the well established program at the School for Workers in Madison, Wis. at the university there. But, if we move ahead from 1945 to 1955 and take a look at a very comprehensive study that was done by Joseph Mira, entitled,

"Labor Education," through the National Institute of Labor Education, we found that 15 universities were actively engaged in labor education programs. Many of you here are from some of those States and are quite familiar, I am sure, with those university programs and no doubt are working and have been working with them in one way or another during the 10 to 15 years that they have been in existence.

The original group included Alabama, University of California at Berkeley and also University of California at Los Angeles, University of Chicago, University of Connecticut, Cornell University, Harvard University, the University of Illinois, Michigan State University with Wayne University, Minnesota, Pennsylvania State University, the University of Rhode Island, Roosevelt College in Chicago, Rutgers State University in New Jersey, and the School for Workers at the University of Wisconsin.

So, in 10 years from 1945 to 1955, we saw one university labor education program expand to the point where it had 14 brothers and sisters, and then in 1959, according to a subsequent report by Dr. Mira at a conference in Wisconsin --which incidentally commemorated the 35th anniversary of the School for Workers --there were 7 new university labor education programs which had been established in the interim since 1955. They included the University of Indiana, the University of Iowa, the University of Michigan, Ohio State University, Southern Illinois, the University of Tennessee, and the University of West Virginia.

From my own research during this past year, I found that in the 6 years since 1959, at least 6 new university programs on labor education have been launched; these include one at the University of Colorado, one at the University of Massachusetts, one at the University of Missouri, and two in Puerto Rico--one at the Interamerican University in Puerto Rico and one at the University of Puerto Rico.

In addition, I am told by our good friend, Dr. Roberts from Hawaii, that they are expanding the activity there at the Univeristy of Hawaii and are planning to engage in an extended program of labor education in the industrial relations section.

In 20 years we have seen the birth of at least 27 new-type departments, on university campuses, that are generally known as labor education programs. Some of these did develop in, and were part of and still remain part of, the more traditional industrial relations center or section in the universities that I have cited. Others have sprung up full-born from seed, have been created as departments with no relationship to other departments in the university; some have evolved through extension services. Whatever their history, there are definite trends of development within these programs that are of interest to many of you.

Five years ago, at a meeting in Washington, D.C., we formed a University Labor Education Association with representatives from most of these universities that I have mentioned. They have been meeting annually since and have quite an active and growing organization, but in no way should this be confused with the older, better established, and better known Industrial Relations Research Association.

The function of these labor education programs in the universities where they have been developing varies somewhat, but essentially they have a tri-partite base of responsibility and function. The first is that of service, or educational programs for the labor movement and its many elements. This takes the form of extension programs in the field which include formal course work; also, conferences, institutes, and summer schools for labor organizations.

In addition, an interest in research has developed within these programs. Those of us who have been doing this kind of teaching in a field that does not emanate from a traditional discipline have found that for both teaching and curriculum to be effective, we must be doing applied and intensive research in the areas of our curriculum. Ours is an extremely general one and runs across the board through all the social sciences and beyond, so that as these programs have grown in numbers, so have they grown in depth. The original programs that I mentioned were in existence 10 years ago in 1955 today have staffs about double the number of professional people that they had then.

Newer programs are coming into being, with improved budgets that allow, if not for adequate staffing, at least for minimally adequate staffing in order to meet their functions.

The third development that has been taking place within these labor education programs is that the regular curriculum of the university, both undergraduate and graduate, includes more labor education personnel teaching the regular undergraduate and graduate courses.

Essentially perhaps--I oversimplify this--we could say that the labor education program, as contrasted with the industrial relations center, tends to be labor-oriented rather than interdisciplinary or tri-partite-oriented. The program starts with the fact of the union and the role and impact of the union in our modern and contemporary society. It then develops its programs and interests and directions from the fact of the union and the direction that the union is taking in its varying roles in societal decision-making.

To illustrate this I might read briefly to you the functions that the Labor Education Center at the University of Connecticut is charged with. These functions would relate, in most cases, to the other kinds of programs which I have identified.

Our first responsibility is to determine the needs in our State for labor education services that the University can appropriately render through the Center and to provide educational courses, conferences and institutes for union officers, members, and other employee organizations as requested.

The second function: to initiate and conduct research in all relevant phases of industrial and labor relations and to publish materials related to such research.

Third, to maintain informational and technical services through periodic newsletter and other publications designed to promote a wider understanding of

union, administrative, and industrial relations problem areas for all citizens in the State; and, fourth, to cooperate with the appropriate schools and departments in the University in the development of labor studies; upon request by these schools and departments to assist undergraduate and graduate students preparing for careers in union functioning or industrial relations to plan courses and to become familiar with the literature, techniques, and opportunities in these fields.

This will serve as a set of guidelines to be used in these programs and, again, will be found at least in part of the other labor education programs to which I have referred.

ANALYSIS OF COLLECTIVE BARGAINING AGREEMENTS

Paul Mulkern, Assistant Regional Director
for Wages and Industrial Relations
Boston Regional Office
Bureau of Labor Statistics, U.S. Department of Labor

I would like to describe briefly in about five or six minutes a new program that the BLS has recently started.

The development of collective bargaining in the United States has brought about many far-reaching changes in traditional employer-employee relations. By 1962, there were over 17 million workers in the United States belonging to national unions affiliated with the AFL-CIO and to unaffiliated unions. However, the impact of bargaining is much greater when we consider the fact that union agreements often cover non-union workers as well as union members and secondly that patterns established through collective bargaining are often followed by non-union firms.

Along with this growth in union membership and the increasing importance of collective bargaining, has come a corresponding interest in the wide variety of ways in which unions and management have tried to resolve their problems. Recognizing this, the Bureau recently commenced a new and comprehensive series of studies analyzing the entire scope of the collective bargaining agreement. Over the next few years this series of studies is expected to result in the publication of some 30 to 40 bulletins. This series will be known as the "Bulletin 1425 Series." You may recall an earlier counterpart, shortly after World War II, which was referred to as the "Bulletin 908 Series," published during the period 1946 to 1950. This was largely a compilation of sample clauses on specific subject areas to show how labor and management in many situations had met and coped with particular problems. Of course, the 19 reports that comprised that series have been out of date for years and out of print, also. However, in its day, the series proved to be very popular and useful in collective bargaining, to arbitrators, universities, and labor and management generally.

I recall that on many occasions representatives of unions and companies visited the regional office to check on one of these particular bulletins

because they wanted to find out just how companies and unions in similar situations had drawn up a clause to cover a particular problem in seniority, promotions, transfers, or what-have-you.

The new 1425 Series will differ from the earlier series in several important respects. First, it will cover a substantially wider range of subjects and practices in illustrating the various types of clauses upon which the parties have reached agreement and, second, and more important, it will measure the prevalence of practices and illustrate those which are most common.

The old series listed sample clauses, but it was difficult to discover the predominant practice, the most common way of writing a seniority clause, or promotion clause, and so forth. The new series, in addition to providing sample clauses, will provide, also, information indicating what represent the most standard practices in regard to these particular matters.

The studies in this series will be based on a union agreement file which the BLS maintains in Washington. This is a file covering 1,000 workers or more, exclusive of railroads, airlines, and Federal Government agreements. We estimate that there are over 1,700 agreements in the United States within these particular guidelines and that they cover approximately seven and a half million workers, or almost half the total agreement coverage in the United States outside these excluded industries. About two-thirds of the agreements are in manufacturing, and the remaining third are in the nonmanufacturing group.

The agreements include individual company agreements ranging from the minimum size of 1,000 workers up to those in the steel and automotive equipment industries, which cover approximately a quarter of a million employees. In addition, master agreements are included, covering groups of companies in local, regional, and industry-wide bargaining situations. An example of these would be agreements in building construction, which cover members of a particular trade in a metropolitan area, agreements in the apparel industry, the ILA agreements in longshoring and, finally, those which tend to be more industry-wide in nature.

To date, two bulletins have been issued, 1425-1 on grievance procedures, and Bulletin 1425-2 on severance pay and layoff benefit plans. It is expected that the other studies, the remaining studies in this group of 30 to 40 will be coming off at regular intervals in the near future.

I would like to outline in a very brief fashion some of the subject areas which will be studied in this series. According to major subject headings, I would say they fall into eight groups.

The first group, on the administration of the agreement, will cover the union security clause, the checkoff, questions of arbitration and mediation, and strikes and lockouts.

The second broad area, on union management rights and responsibilities will cover the questions of subcontracting, plant removal, adjustments to and introduction of technological change and other questions of that nature.

In the area of wage determination, there will be a bulletin on incentive systems, rate structures, wage differentials, general wage adjustments, and subjects of that type.

The fourth broad heading will relate to the job security issue. This will go into the subjects of hiring and transfer, layoff procedures, questions of seniority and recall, and questions of training and retraining.

Fifth, a group under the broad heading of plant operations, will include the subjects of hours of work, scheduled work week, premium shift pay, hazardous work, and questions of discipline and discharge.

The sixth broad group on paid and unpaid leave will cover the general area of fringes, vacations and holidays, sick leave, military leave, jury leave and so on.

Seventh, the employee benefit plan area will cover health and insurance plans, pension plans, and the ways in which the parties treat these particular subjects.

Finally, a general category will cover such subjects as the older worker group, the question of nondiscrimination, and questions relating to the employment of particular groups of workers.

When this series of studies has been completed, several years from now, it is planned that all the bulletins will be combined into several volumes and accompanied by a comprehensive cross-reference index.

It is hoped that the studies will furnish a valuable insight into the complex problems confronting unions and management and the wide variety of ways in which they have attempted to work out these problems.

CHAIRMAN CABE: We do have some time left for questions.

MR. DAVID MANN: I am with the President's Committee on Equal Employment Opportunity.

Except for a slight reference made to disadvantaged persons in the Poverty Program, there apparently is nothing being done, on gathering information on minority group persons in the labor force, by various State labor oganizations. There is a desperate need for this kind of information, as you well know. There is a Civil Rights Act which will become effective on July 2nd.

The Act provides for record-keeping by employers subject to the Act. There is the possibility of employers reporting to the Commission their employment by race, occupation, and so on. To what extent, then, have the States been gathering this information about minority group employment?

We in the Federal Government have attempted to do this, but there are limitations on the kind of data we have collected. There is not a State represented here today that is not going to have a significant minority group

population. I am sure the statistical-gathering mechanisms of the various States here could place much more precise emphasis on the problems of minority group employment that we can do at the Federal level.

For instance, there are several States here that could do a very good study of nonemployment of Negroes, of the employment of Negroes, or unemployment of Negroes. These are three interrelated problems. There is not a State that escapes the stigma of having within its boundaries several large employers who have yet to hire their first minority group person. This is true despite the fact that the population make-up and the labor area make-up consists of a significant number of minority group persons qualified to work, eligible to work, employable, and who do not have to go through a retraining period in order to qualify for certain types of jobs that might be available.

Consequently, I am addressing myself to this group here to find out what they are doing to develop this kind of information that would help the States assume a better position to withstand the problems of minority group employment than possible heretofore.

CHAIRMAN CABE: I do not know whether anyone on the panel feels competent to answer that; maybe someone from the audience. This is one of the things that Louis Levine has mentioned on several occasions in the past. For the past 2 or 3 decades, we have been spending all of our time getting rid of any kind of data or information that tells us about minority groups, and now we are suddenly confronted with the fact that we need to know. This is showing itself in terms of employment; it is showing itself in terms of apprenticeship, for instance, where we have no records or where we have been saying for the last couple decades that this is information that should not be used. Now, in an attempt to get rid of discrimination, we find that we do need the information.

Would someone in the audience like to speak to this point?

MR. CHARLES A. PEARCE: I think that you have described the general situation very well. We have been inhibited from identifying this particular segment of the labor force and have found as a result--at least in New York--in the last several years that we have had emergency needs for quick estimates. We have had to put together quick estimates based on such benchmarks as the Census affords and such benchmarks as fragmentary sources and the judgment of informed people can give.

For example, we in New York have had to put together estimates on the number of nonwhite apprentices. That was based on a wide assortment of sources and represents nothing better than an informed guess. We have had to put together information on nonwhites in our public works projects. Again, the informational sources were spotty.

We have plans for research--I shall describe these in somewhat more detail tomorrow--which I think will get into the subject of the nonwhite worker in the skilled crafts, his opportunities in the skilled crafts. This particular project is not underway, but this aspect is very much a part of our concern in that study.

Of course, in New York we do have a Commission on Civil Rights which conducts investigations of particular situations on complaint, but now it may do so on its own initiative. Because now it may proceed on its own initiative I would expect that it will be making more investigations which will yield quantitative information with some comprehensive significance.

MR. CLAGUE: I think this gives me an opportunity to point out the difference between statistics, statistical purposes, and administration.

One of the reasons why the emphasis on color was lost is that in the operation of the Employment Service in the early days, with which I was connected, the feeling was that if you identified the person, then administratively he would suffer from discrimination.

On the other hand, when you collect data for purely statistical purposes where none of this is disclosed, you can get adequate information. As you know, in our monthly reports on the labor force, we always have statistics of color, whites, nonwhites, various groups of nonwhites, et cetera, because that does not go down for administrative purposes; it is confidential information.

This does not mean that we should not proceed in that direction, the more you do proceed in that direction, the more you run into the problem of the administrative use of data as distinguished from purely statistical use. It may be that the States should also take account of that and the variety of ways you can get information which, in turn, would not be used against an individual but would give you a statistical report.

FROM THE FLOOR: I would like to add to what Mr. Pearce said. Since 1940, we have broken down our statistics on labor activities by "white" and "nonwhite." Throughout the years we have found this kind of a breakdown useful, not only for public information but also for administrative purposes.

MR. MANN: The original FEPC which went out of business in 1945, predicted in 1945 what is taking place today, because of lack of information and the tendency for employers to discriminate. They predicted that something had to be done with poverty. The old FEPC predicted that there would be this national unrest, that there would be more or less of a revolution on the part of the Negro to rebel against the limitations of opportunities that have worked against them.

I do not know to what extent they have prevailed upon the statistical resources available to them in the State to develop the kind of information which could be put to great use.

We collect information, but of a very limited nature. We can make some projections. We talk about productivity. We talk about the results of automation as if it has a definite relation to the dislocation which might take place subsequent to its introduction. A good segment of the Negro population--90 percent or better--is in blue collar jobs. The dislocation that takes place among the Negroes will be consequently much greater than among the other employees who are dislocated by automation.

Therefore, we must know much more about the industries that are prone to technological advances; those industries could represent the largest concentration of Negro employment. There are certain types of industries where Negroes are highly concentrated in semi-skilled jobs. As a consequency, States faced with this problem are going to have to find something to do with respect to the relocation of minority group persons who are affected by technological advances.

I am not talking about Negroes only. I am talking now about 22 million Americans in minority groups. We are talking about three and a half million Spanish-Americans; we are talking about the American Indian; we are talking about the Oriental; and we are talking about the Negro, and we make the further distinction between Negro and other nonwhites. There is a vast difference between the utilization and the employability of other nonwhites in comparison with that of Negroes. There is a great variation from place to place. The other nonwhites dominate the better types of jobs more than do the Negro. In certain cities you would never expect this to happen, but it does happen--the key jobs, the better paying jobs, are not necessarily identified with Negroes or occupied by Negroes when you are talking about nonwhite. They are associated with other than Negroes.

FROM THE FLOOR: Mr. Carpenter, you mentioned the interest which some of the OECD countries have in automation. Yet, the statistics reported by your section seem to indicate that most of these countries in Europe have hardly any unemployment at all. Have they found a solution for this problem, or are they just lucky, or hasn't automation arrived yet in countries like Sweden?

MR. CARPENTER: Oh, yes, automation has arrived in some of the countries, and it is welcomed very much, because of the fact that they do have labor shortages. The trade unions of Sweden, for example, cooperated very much in setting up an automated shipbuilding plant but generally speaking, automation has not arrived to great extent in Europe.

STATISTICS FOR INDUSTRY AND GOVERNMENT SAFETY PROGRAMS

Chairman: Robert H. Ferguson
Assistant Director of Industrial Relations (Ret.)
Republic Steel Corporation

In the years that I have been associated in the safety activities through the length and breadth of this land, of course, all of us that are dedicated in this field have written millions of words, and we hope some of it has not fallen on deaf ears. The only time that we know that it has not fallen on deaf ears is when we kick someone or somebody makes a terrific mistake and then we hear about it.

When Frank McElroy indicated that this subject had been on the programs 23 times, I think it is an outstanding tribute and an outstanding compliment. This is a subject, true, that seldom makes the mastheads; it seldom makes the marvelous news; and, yet, when a State or the Federal Government or a growing business begins to look at cost pictures to find out what the story is, it goes back and looks at what it is doing with the personnel on this particular subject.

It is fundamental in a case like this, because in my whole business career of almost forty-five years I have always found that the individual at the top is vitally interested in the people that work in that organization. I do not want to say "work for the boss-man," but I mean work for the good of a company or the good of a community.

Nevertheless, this whole safety picture today is in a period of change. In fact, never before in my life have I experienced anything like we have experienced for the last ten years. It is almost an about-face, and too often--when Mr. McElroy made that comment--this kind of a story does not make the mastheads until we start looking down the road to see where we are going.

We have some very able speakers with us this morning. We are going to reach into some of the detail involved in this picture, and I think you are going to enjoy it.

The first man to appear before you this morning is Dr. William E. Tarrants, who is now Assistant Chief of the Division of Industrial Hazards of the Bureau of Labor Statistics. I would like to comment on Bill Tarrants for just a minute, if I may, please. He was formerly Assistant Professor of Research and a Research Associate at the Center of Safety Education at New York University. He has taught courses in safety engineering and industrial engineering at Ohio State University and has held the positions of Instructor of Industrial Engineering and Research Associate in the Opinion Research Group.

Why Injury Statistics?

William E. Tarrants, Assistant Chief
Division of Industrial Hazards
U.S. Department of Labor

As you will see, I believe that injury statistics are extremely important, although I must admit to a positive bias in the beginning. Let us ask outselves that question again and try to be as objective as we can with our answer.

Why do we need injury statistics? I hope I am not over-stating the case when I say in a rather far-reaching manner that the entire safety movement was born, grew in stature, and lives today because of statistics. Furthermore, the safety movement as we know it would most surely die if statistics were not available to provide the nourishment, the energy, and the guiding force in support of the nation's accident prevention efforts.

This concept may seem incredible to some of you, but let us take a look at a few points in fact. Isn't it true that your acceptance and industry's acceptance of the need for occupational accident prevention programs is based upon evidence that accident problems exist and that their existence is of some vital importance?

I am sure you have all heard the basic facts of the problem. Each year in the United States, over 14,000 workers are killed in industrial accidents and over two million others experience disabling injuries while at work. It is widely publicized that these injuries cost industry approximately five billion dollars per year, and that most of these costs ultimately fall upon the consuming public.

Furthermore, the frequency and severity of these injuries are identified and used as an index of accident problems which exist within various industries throughout the country. The thoughts and actions of countless individuals and organizations are strongly influenced by these figures. They show conclusively, that accident problems do exist, and that their existence has a profound influence on the nation's human and material resources.

Now, ask yourself for a moment, "What if these figures--these statistics that we talk about--were not available?"

It seems quite reasonable to speculate that in the absence of a means of identifying the accident problem, your interest, the interest of industrial managers, and the interest of the general public in accident prevention would be greatly reduced, possibly non-existent, unless perhaps by chance somebody close at hand, close to you, suffered a serious accident or maybe you yourself were injured by accident.

Actually, when we look at the real world facts in this case, we find that occupational injuries are relatively rare events in the life of any given individual and that few persons can form any clear understanding of their

importance as a social and economic problem solely from their own experience. Statistics of the kind I have just described expand the scope of accident knowledge and create a realization that there is a problem in urgent need of solution. The occupational safety movement began with statistics developed to identify the problem, grew as statistics provided the basis for accident prevention decision-making activity, and lives today because statistics have shown the positive results of these prevention efforts and have created and stimulated the urge to action.

Let us take a backward glance at the occupational safety field for a moment. This places the present, I think, in a little better perspective. The occupational safety movement, as we know it in the United States, began only seventy-three years ago when the Joliet Works of the Illinois Steel Company established a formal safety program for its employees. Several States were early in recognizing their responsibilities in this field. Massachusetts led the way by establishing a safety inspection program in 1867 and an accident statistics program in 1869. This was due largely to the humanitarian and social arguments voiced by the clergy and the press.

In 1877, the Massachusetts legislature voted to compel employers to put safeguards on hazardous machinery. Then, in 1887, Massachusetts passed an employer's liability law which made the employer liable for damages whenever the worker was injured.

These laws contained numerous loopholes, including adherence to the three common law defenses of contributory negligence, assumption of risk, and negligence of the fellow workers. In each of these three cases, if it could be shown that the common law applied, the employer was no longer liable.

General dissatisfaction with the employer liability laws finally resulted in the enactment of State Workmen's Compensation laws beginning around 1911. The passing of the Workmen's Compensation laws marked the real beginning of the organized safety movement in the United States. Under these laws, employers were required to pay the injured worker's medical and hospital expenses, plus compensation intended to furnish him and his dependents at least a minimum subsistence during the period of disability. The important point was that these benefits were provided regardless of who was at fault in the accident. Thus, the question of fault was eliminated and the only requirement for payment was that the injury occurred while on the job.

These laws, by making worker injuries immediately and directly expensive to employers, had perhaps the greatest single effect on the promotion of safety interest and accident prevention efforts in general. Employers were financially motivated to establish safety programs, and for their own financial protection they began to learn how to prevent accidents.

About this time a number of people entered the safety movement directly. They practiced accident prevention and began calling themselves "safety engineers." A group of employers banded together around 1915 and organized the National Safety Council for the purpose of collecting accident statistics and formulating a collective effort to combat work accidents.

This group based its efforts on the basic doctrine that all accidents have causes, that these causes can be identified and corrected, and that by this process accidental injury and property damage losses can be prevented.

Today, the occupational safety movement is big business--how big, no one really knows. We see concrete evidence of its size in the thousands of people who attend the National Safety Congress, the President's Conference on Occupational Safety, and the many State and local safety conferences conducted annually throughout the country.

Many colleges and universities have established courses in safety engineering, and they have integrated safety into the various subjects contained in their curricula. In fact, five universities now offer a degree specialization in safety engineering or industrial safety, and degree programs are available at both the graduate and undergraduate level.

Plans are currently in progress to expand this number.

Large companies were quick to recognize the need for internal safety programs, and today it is rare to find a plant with over two hundred and fifty employees that does not maintain a formal safety program, although the smaller plants lag rather seriously in this respect. It is significant that the American Society of Safety Engineers now has over 7,500 members, and that they are moving to establish standards of practice, education, and certification which will give their members true professional status.

It is important to observe that woven throughout the historical development of the safety movement has been the thread of statistics, providing cohesion and structural strength for the dynamic progression of the field. These pioneers were spurred to action by early statistics describing injury occurrence. These data were used to interest others, and it was quickly recognized that a continuing flow of statistical information was essential to sustain that interest.

Statistics provided proof that management's efforts in reducing accidents were productive, and in fact should be intensified. Measures of progress became important tools for the safety engineer. Similarly, records describing how and why accidents happened became important factors in planning safety programs and in teaching people to recognize and avoid unsafe practices and hazardous conditions.

Statistics in the form of injury frequency and severity rates and accident factor analyses served their purposes well. Most importantly, the practitioners of the safety art recognized that the flow of these statistics must be continuous if meaningful measures of progress were to be maintained. Only current facts can sustain interest and keep the safety movement viable. Their importance is evident at every turn, for without meaningful statistics, it would be very difficult to rationalize any accident prevention program.

If we accept the premise that the safety movement must have injury and accident statistics, the next question we might ask is, "What responsibilities do the State and Federal governments have for providing such statistics?"

I am sure the answer is obvious to all of you. Only governments have the resources to produce the comprehensive basic statistics needed to identify meaningfully the problems and measure progress toward accident reduction.

Outside of government, there are, of course, many special statistical activities, some of a continuing nature, which serve particular purposes and are most useful to the safety movement, but these sources provide limited information and the data are usually collected from a relatively narrow segment of the population.

State and Federal labor departments all have a statutory duty to foster and promote the welfare of all workers, and keeping the occupational safety movement alive and vigorous is of the essence in such a responsibility. Unfortunately, only a few State labor departments have been given adequate resources to do properly the task that should be performed in this area.

A second question we might ask ourselves is, "Given adequate resources, how can we best achieve our statistical service objectives?"

Progress evolves from a restless discontentment with even the best of what is currently practiced. It is not enough just to pull ourselves up to the currently acceptable level of performance. If we are to achieve more effectively the objectives of accident prevention, we need to appraise continually our present statistical methods with a view toward their improvement.

The answer to the question, "Why Injury Statistics?, takes on new dimensions when we also ask, "Where do we go from here?"

A close examination of our present activities in the injury statistics field reveals several areas where improvement might be introduced. First, we need to improve the validity and reliability of accident data.

Statistics has been defined as a body of methods for making wise decisions in the face of uncertainty. The quality of the statistics and ultimately the quality of the decisions made from them is dependent upon the quality of the information from which they are derived. Some go so far as to state that there are no bad decisions, only bad information, because if all the facts are known, the solutions and decisions often suggest themselves. I think this statement requires serious thought.

In the area of accident prevention, wrong or inadequate information about accident causes leads to wrong decisions about which prevention programs to recommend. Let me give you an example which I often use, and yet I think it very forcefully illustrates this problem.

We had a very serious accident while I was associated with the Ground Safety Program at an Air Force installation in Europe. A jeep accident occurred in which two people were killed and two others were rather seriously injured.

During the course of the accident investigation, we asked the driver "What happened?"

The driver gave the following story:

> I was driving down the road at night when all of a sudden an owl dropped out of an overhanging tree and struck the windshield in front of me, causing me to lose control of the jeep. We left the road, rolled down a bank and overturned. The next thing I remember I was waking up in the hospital. The Stars and Stripes, a daily newspaper for the U.S. Armed Forces in Europe, picked up the story and printed it for distribution all over the continent. The headlines read "Falling Owl Causes Fatal Accident." The story identified falling owls as a rather serious potential accident problem for all automobile drivers. The drivers were instructed to take certain defensive actions to avoid being struck by a falling owl. Certain other actions were suggested in order to minimize the severity of this kind of accident and prevent a recurrence of the fatal results previously experienced.
>
> Fortunately, our investigator became a little suspicious of this story and began to probe further into the evidence. When several inconsistencies were pointed out, the driver finally broke down and described what really happened. The men were driving down the road at night when they suddenly observed an owl lying in the middle of the road ahead. The owl was already dead. As they passed the dead owl, one of the men in the jeep said to the driver "I would like to take the owl back with me as a souvenir. How about turning around so I can pick it up? I will take it back to the barracks, stuff it, and hang it on the wall." Well, they turned the jeep around, went back and picked up the owl, and proceeded toward their destination. After a short time they decided to stop at a pub and have a few beers. As they drove on, the beer combined with fatigue from a busy day made the men drowsy and soon everyone was fast asleep except the driver. Finally he dozed off and lost control of the jeep. The vehicle rolled down the bank and overturned. This is how the accident really happened. It had nothing to do with falling owls.
>
> The point of the story is this: you can develop the best accident prevention program in the world based on how to stop falling owls from causing accidents, but if falling owls are not part of the problem, then all of this work is meaningless. I have encountered the difficulties of misinformation in accident investigations so often, I have come to call this problem "the falling owl syndrome," borrowing a term from the physician. I define "the falling owl syndrome" as a constellation of false events which results in an erroneous causal conclusion.

The problem of inadequate data or the lack of good, valid data--data that measures what it is supposed to measure and tells what it is supposed to tell--

is a never-ending one. But, we must work toward increasing or improving the validity and reliability of our accident data because we find that the validity of decisions we make in accident prevention is a direct function of the validity and reliability of the information upon which these decisions are based.

Our accident statistics will improve as we develop better data-collection methods, improve our population sampling techniques, establish more precise causal classification categories, and improve our system for checking the validity and reliability of reported accident information.

A second area where improvement might be introduced is this: We need to present additional decision-making information along with instructions concerning its meaning and use.

Statistics serve in at least two capacities. First, they give us methods for organizing, summarizing, and communicating data. Second, they provide methods for making inferences, beyond the observations actually made, for large classes of potential observations.

The set of methods serving the first of these functions is generally called "descriptive" statistics. Most of the accident and injury statistics presented by State and Federal governments are descriptive in nature, but if we wish to generalize from our knowledge of a sample to the entire population of which the sample is only a fraction, we need a body of methods which will enable us to arrive at conclusions extending beyond the immediate data. The techniques that enable us to draw inferences about populations from our knowledge of samples are called "inferential" statistics.

Our ability to make objective decisions is greatly enhanced when techniques of inferential statistics are introduced. They not only aid us in determining what inferences we can draw, but they also tell us how safe we are in drawing them. The addition of this new decision-making information to our body of accident and injury statistics will tell us our margin of error when we predict some population measure such as average injury frequency rate and enable us to test hypotheses about various measured relationships within the population.

Actually, the purpose of description is to prepare the way for inference. In practice, inferential statistics is perhaps much more important than those of a descriptive nature. We must study samples, but we are seldom interested in the samples themselves. Inferential statistics permits us to go beyond our data and tells us how much risk we take in doing so.

Additional information which would enhance our inferential capability and greatly aid the user in making decisions include measures of dispersion such as the standard deviation, the variance, and the range; and procedures for testing hypotheses such as the t-ratio, the chi-square text, and the analysis of variance.

Three, we need to provide better information by improving and expanding our data analysis procedures. This point ties in closely with the presentation of additional decision-making information. In analysis work, we need to apply

the techniques of inferential statistics to put new meaning in the data interpretation process. Data analysis is probably the weakest link in the injury statistics development system.

It is important to keep in mind that statistical data have to be interpreted. They seldom, if ever, "speak for themselves." Statistical data in the raw simply furnish facts for someone to reason with. They can be extremely useful when carefully collected and critically interpreted, but unless handled with care, skill, and above all objectively, statistical data may seem to prove things which are not at all true.

It is sometimes said that statistics are used the way a drunk uses a lamppost, for support rather than for light. Special care must be taken in analysis not to bias the results because of personal interpretations and conclusions that are unwarranted by the nature of the data itself.

The frequently heard comment that statistical conclusions are wrong is often supplemented by the view that when they are not wrong, they are self-evident and trivial. In fact, I have heard it said that a statistician can be defined as "a person who draws a mathematically precise line from an unwarranted assumption to a foregone conclusion."

Misuses and misinterpretations in the analysis of statistics are probably as common as valid uses. One way to misuse statistics is to ignore all data that do not support your preconceived hypothesis. This simply means if it does not prove it, forget it.

I recall an example of this from my own experience. I was working as a safety officer on the staff of an installation commander in the Air Force. One day he called me into his office and said, "Tarrants, I have got to talk to the General about accidents; we want to look good to the General; I want you to draw for me all of the charts on accidents and injuries that you can possibly think of; we will pick out those that make us look good and throw the rest away."

And so help me, this is what happened!

Darrell Huff is his interesting book entitled How to Lie with Statistics and Allan Wallace and Harry Roberts in their book entitled Statistics: A New Approach, have made excellent presentations of statistical fallacies and errors in data analysis. When you first read them, they strike you as being kind of humorous, but then when you start noticing evidence of these fallacies all around you, and observe that people accept them as facts, they become rather tragic.

These authors describe errors in the use of basic definitions underlying an investigation, in the application of these definitions, in the measurement or classification of individuals or objects, and in the selection of individuals for measurement. They also illustrate errors in the use of the resulting data by making comparisons improperly, by failing to allow for such indirect causes of differences as heterogeneity of groups with regard to important variables,

by disregarding the variability that is usually present even under apparently constant conditions, by technical errors, and finally by misleading verbal or graphical presentations.

The final area of improvement I would like to mention in connection with injury statistics is the need for a better understanding of the field within which our results are applied.

Statistics is a tool which can be used in attacking problems that arise in almost every field of empirical inquiry. The statistical approach, though universal in its underlying ideas, must be tailored to fit the peculiarities of each concrete problem to which it is applied. It is dangerous to apply statistics in "cookbook" style, using the same recipes over and over, without careful study of the ingredients of each new problem.

We may be especially interested in statistical methods, but it is important to recognize that statistics cannot be used to full advantage in the absence of a good understanding of the subject to which they are applied. Not only must we have a good understanding of the subject ourselves, but the persons or groups with whom we are communicating must have an equally good understanding of both the subject area and the terminology we use before we can effectively convey information.

I recall as story which will serve to illustrate this problem. The first time I heard it, the author professed to its truthfulness, but I began to doubt its authenticity after I heard it repeated two or three different times. I will try to describe it as I first heard it, because that version has perhaps the greatest chance of being the true one.

It seems that a safety director of a corporation was presenting material on the accident picture in the plant to the plant manager and his staff. The plant manager, being rather new on the job, listened very carefully to what was said. Previous to the presentation on safety, he had heard a presentation on the progress in sales and one on the favorable profit trend. Now the safety director had his turn. The plant manager listened carefully, and at the end of the presentation he felt compelled to make a statement that showed how much he was in favor of accident prevention. He wanted to demonstrate that he was really in support of the safety program. He got up and said, "Gentlemen, I want you to really push this safety program. During the succeeding months when we look at these charts, I want to see that frequency rate going up and up and up."

Well, I am sure he had in mind the sales and profits frame of reference. He had been looking at charts showing the rising trend of these items and he thought everything else ought to go up too!

The problem, of course, is that he did not really know the meaning of the frequency rate. He was looking at the problem from one frame of reference, and the safety direction who presented the information had a completely different idea in mind.

Successful statistical work depends greatly on knowledge of subject matter--knowledge on the part of those who work in it, and knowledge on the part of those who receive the information and make use of it. Mere manipulation of figures or preparation of standard tables and graphs is seldom fruitful. This is very important. I think we are perhaps more guilty of this error than any other of the errors I am discussing. Mere manipulation of figures or preparation of standard tables and graphs is seldom fruitful unless guided by a clear conception of the subject matter and of what relations would be worth looking for.

To a considerable extent, statistical application in a particular field is an art rather than a science. As with other arts, however, there are certain basic techniques whose mastery is necessary though not sufficient for success.

As a final thought, I would like to quote from a recent article on statistics in general by George Hagedorn, Director of Economic Studies of the National Association of Manufacturers. He says:

> "People who really understand the figures, their virtues, and their limitations are a small minority. The great majority who do not understand the statistics are divided into two classes. First, there are those who have an exaggerated respect for government data. They assume that if only you put the right statistics together, there will emerge from this compilation of facts the right answers to any given national problem. The second group is composed of those who have an exaggerated suspicion of published government statistics. In this view, since government officials frequently cite statistics in support of their partisan and questionable proposals, there must be something wrong with the statistics themselves."

I think we have seen many examples of both these views. People often quote selected statistics which support their views and ignore all data in opposition to their particular position.

Mr. Hagedorn continues:

> "The truth lies somewhere in between. The figures published by old-line statistical agencies are generally prepared in an honest and competent manner, but no matter how honestly and competently the figures are prepared, it is a mistake to imagine that government statistics are facts which speak for themselves. They speak clearly only to those who have taken the trouble to investigate the definitions on which they are based and the techniques used in preparing them. They give answers to economic questions only when they are combined with a good measure to common sense, knowledge of non-statistical facts, and a basic understanding of what makes our economy work."

To government statisticians, this means that not only must we produce the most valid and reliable statistics possible, but also that we must make sure that we follow standard procedures in compiling the figures, that we properly apply our professional competencies to the analysis of data, and above all that

we must fully explain and be willing to defend our data development and analysis procedures. We must be humbly conscious of the fact that we do not know all the answers. When these principles are put into practice, we can feel confident that we are doing our part to keep the occupational safety movement vigorous and successful.

CHAIRMAN FERGUSON: Bear with me while I comment on a few of the things our speaker touched on. These are yardsticks: Where are we going, where have we been? In terms of fatal injuries in the manufacturing operations, 14,000 people died in accidents last year. That figure has been pretty stable for a number of years, but 25 or 30 years ago that figure was 23,000 or 24,000.

The thing you are primarily interested in comes down to the enforcement of workmen's compensation acts and the relation of statistics to this particular field.

We do have an obligation, and that is to prevent injuries to the man on the job, to his co-workers, to his family while at home. Injuries are costly to those directly involved and to the community in terms of lost services.

I cannot stress this point too strongly; but, the thing that we have always been very interested in, particularly in the last 5 or 6 years, is the number of States that are involved in special studies by the U.S. Department of Labor of certain facts and figures that are being developed properly. They are fundamental. In our work in the Business Research Advisory Council on work injury statistics, I cannot stress too strongly the special studies. Every time we have come through and developed one of these, we find that the accident curve drops in that particular industry when all of this material is called to the attention of the proper people. Are there any questions?

MR. CHARLES A. PEARCE: I agree with you about the importance of special studies. I think this is one of the most useful products of the BLS program. Is there a hope that that special study program will be stepped up in the near future?

MR. McELROY: I think all of you who are associated with State or Federal programs know that the answer to this is the difficulty of obtaining the necessary funds. We have been most anxious to expand this program. We have requested funds each year for about 8 or 10 years, to expand the special studies program. We have not reached first base yet.

Actually, at the moment, things are looking up a little. We have received some very substantial support from outside the government and from industry. We do hope that the program is on the verge of being expanded; perhaps not expanding as much as we would like, but nevertheless moving forward.

I would like to comment on one or two points of Bill Tarrant's presentation. He mentioned that the estimated cost of work injuries in the United States approximates five billion dollars. It was very interesting to hear that the Federal deficit was reduced to approximately four or four-and-one-half billion dollars last year. If we could prevent these accidents that occur in industry, we could almost wipe out that Federal deficit with the savings.

The four or five billion dollars that accidents cost usually comes out of corporate profits. This is something to think about, but more seriously, the five billion dollars that industry pays is only a small part of the true cost of occupational accidents to the nation as a whole.

I think Mr. Skolnik indicates in his findings that not over two-thirds of the loss to the injured person is really covered by compensation payments. Unfortunately, compensation payments generally have a cutoff point. They do not last the rest of the life of the individual who has experienced a serious or permanent impairment: However, the loss of possible earnings may last the rest of his life.

We have heard a great deal in the last couple of days about the Poverty Program. One of the sources of poverty but not necessarily the greatest, is in families of bread-winners who have been killed on the job or so seriously injured that their income has been drastically reduced.

We could make a good dent in poverty if we could eliminate these accidents. The people in the States and we contribute toward this objective by preparing and presenting the statistics that keep the safety movement alive.

CHAIRMAN FERGUSON: Thank you very much, Frank. Any other questions?

MR. ARTHUR LENZ (New York): One of the fundamental problems in workmen's compensation statistics is the diversity in the laws throughout the States. We who work actively in the field only learn about statistical techniques that are being used in other States at meetings such as this or through correspondence. Would it be possible for the Federal Government to act as a clearinghouse to disseminate more widely statistics in the field of work injury?

The only uniformity we have in this field is in the basic injury frequency and rate program, but in terms of workmen's compensation statistics, resources are limited, and publication is not very extensive.

We will hear today about costs; we will hear about an injury program; but, at each of these meetings, we hear very little and very infrequently about developments in statistical techniques in the field of workmen's compensation itself. I refer to the whole gamut of what happened to the fellow--what his occupation was, what his industry was, how the accident happened.

I think what is lacking here is not knowledge, but publicity, and a little light on the knowledge that we each have. I again suggest that perhaps this is a function that you might consider in the Federal Government, that of acting as a clearinghouse.

The more difficult matter, traditionally, is trying to develop these diverse statistical programs on a comparable basis. As a concrete illustration, we have had a conflict in the definition of what, in the various States, constitutes a week of lost time. Wisconsin uses 6 days; New York speaks of a calendar week; Illinois speaks of a week. I think we all speak of something quite different.

MR. McELROY: I do not like to monopolize the position here, but Mr. Lenz has raised a question that is very close to my heart.

In 1912, when the International Association of Industrial Accident Boards and Commissions was organized, their first order of business was to establish a committee on workmen's compensation statistics. That committee prepared a report, which was submitted at the 1913 convention recommending that the Department of Labor establish a clearinghouse for workmen's compensation statistics and that the Department take the lead in introducing standardized methods of compiling workmen's compensation statistics.

At that time, the Commissioner of Labor Statistics accepted the challenge, but he had to qualify it. He said, "We shall do what we can, but unless we get the necessary funds, it may be a while before we can get the program going." We are now in 1965, and the program has not been started yet, but the IAIABC has repeatedly adopted an identical resolution. The desire is there, the need is apparent, but the resources to do what Mr. Lenz suggests have never materialized.

When Max Kossoris was with the Industrial Hazards Division, he prepared a manual on industrial injury statistics which outlined the desirable types of workmen's compensation statistics that could and should be prepared by the individual States. This manual was one of the most popular of the Bureau's publications up to that time. I believe it was published about 1940. We still receive a fairly substantial number of requests for it from all over the world, but our progress in this field stopped with that particular bulletin. It is no longer available, unfortunately; it has been out of print for a long time, largely because it contained several chapters on accident analysis and on the computation of injury rates, the procedures for which have been modified substantially in subsequent years. The basic concepts of statistics of workmen's compensation that were contained in that manual are still valid; however, as far as putting into effect the recommendation that a clearinghouse be established, at this moment we are perhaps as far from achieving it as we were in 1913. I do not see any prospect in the near future of developing this sort of approach.

MR. LENZ: We appreciate the leadership, and we are all familiar with the excellent manual Mr. Kossoris put out. We still use it: However my point is that without the necessity of developing a special program, the BLS might take some of our published material which we cannot disseminate as widely as we would like to, make it available elsewhere, and provide us with material from other sources. When I say "clearinghouse," I do not suggest that the work be done by BLS. I suggest that when a technique is developed in one area, enough publicity should be made available so that other people will be able to evaluate that technique and decide whether they might be able to use it.

What I am suggesting is a much less expensive program whereby, if something is developed in California, people in New York and Wisconsin and throughout the country should have some idea what this is.

MR. McELROY: In answer to that particular point, when we receive a request from any of the States for specific information about a particular type of problem, we try to round up all of the available materials from the other States and to see that they are provided to the State having the problem.

The difficulty, of course, is that frequently the States will develop new aspects of their program, and we will not know about it. Sometimes we hear of these developments only through organizations and meetings like this. In the International Association of Governmental Labor Officials meetings, the States do describe what they are doing. This morning we will hear what Wisconsin is doing, and we will hear about a very interesting development in Illinois.

Unfortunately, we simply are not staffed to a point where we can send people to visit the different States and by that means actually keep track of what they are doing in the field of workmen's compensation statistics. This is one of the things we would like to do, but there are limits to how many areas one small staff can cover.

MR. WALTER KEIM: Frank, suppose they send this information to you for your use in your shop? Would it be possible for you to pass it on to other States you think might be interested?

MR. LENZ: Instead of attempting to cover the waterfront, why not pick out interesting developments in some of the States and review them in an annual article or monthly report, describing interesting developments during the past year?

MR. McELROY: To answer Walter, we do try to be placed on the mailing lists of all of the States to have them send us their materials.

When we have a report that is particularly significant and represents a new venture or an unusually good presentation of materials, we always write to the authors and suggest that they transmit the report to all the other States. We haven't the facilities to reproduce it ourselves, but we do encourage its distribution.

MR. KEIM: What I had in mind was something similar to the arrangement we have on Mr. Pearce's retail trade study. He advised us of the availability of this study. We, in turn, advised the other State statistical officials of this study and suggested they contact you for copies. Did you get any requests, Mr. Pearce?

MR. CHARLES PEARCE: We have had a number of requests. I do not know how many were as a result of your particular circulation since we have a mailing list of our own.

I think, generally, that States who are really interested in developments elsewhere find ways to get in touch with other States. Whether or not it would be worth the trouble and expense, it would be a great convenience to have an updated record of significant developments that are taking place in the various

fields, certainly in the field of workmen's compensation. We probably know less about what other States are doing in this field than in almost any other field I can think of.

MR. LENZ: I think the problem is that Workmen's Compensation agencies are not basically research agencies. They are not operating a business in the publishing or printing of manuals.

A State Injury Rate Program

Henry J. Gmeinder, Chief Statistician
Statistical Division
Wisconsin Industrial Commission

The year 1960 marked a turning point in our injury statistics program in the State of Wisconsin. The Wisconsin Council of Safety, in its 1960 Annual Report, noted that the leveling-off trend in Wisconsin's workmen's compensation injury cases indicated "the need for a new approach" in further reducing occupational injuries. This need triggered Wisconsin's work injury rate program.

The inauguration of our work injury rate program coincided with the 50th Anniversary of our Industrial Commission. The information gathered from this program was intended to complement our workmen's compensation injury statistics.

We began by surveying manufacturing establishments in 1961. In 1962, we added construction. The information for these two major divisions of industry are collected in cooperation with the Division of Industrial Hazards of the Department of Labor.

A standard work-injury rate program covering State of Wisconsin employees was started January 1, 1964; and now, in 1965, we have also asked private self-insurers to give us information so that we can compute standard injury-frequency rates. Now we are compiling and publishing standard injury-frequency rates for manufacturing, contract construction, State governmental employees, and non-governmental self-insurers. Additionally, last year we asked Mr. Forrest T. Moyer of the U.S. Department of Interior if he could give us standard injury rates for certain portions of the mining industry.

Information on standard injury rates is compiled in accordance with the American Standard Method of Recording and Measuring Work Injury Experience, Z16.1. Standard injury rates are based on all disabling or lost time injuries and are not limited to those with 4 days or more of disability, as the Wisconsin workmen's compensation statistics are.

On our injury rate surveys, we code the industry and employer file number. The place code tells us the location of the establishment. Other types of information compiled under this program are (1) exposure data, which include the average number of employees and total hours worked by all employees,

(2) number of deaths incurred and time charges assigned, (3) number of permanent impairments and corresponding time charges assigned, (4) number of temporary disability cases involving one or more days of disability, and, (5) number of medical treatment cases (where this information is available).

It is my understanding that only 12 of the 50 States have a cooperative arrangement with the U.S. Department of Labor for the collection of work-injury rate data. Ten of the States, including Connecticut and Wisconsin, participate in an annual survey. Two States participate in a quarterly survey. The purpose of this survey is to provide information that will stimulate interest in accident prevention and provide the safety movement with a measure of its problems and accomplishments.

The one report submitted to the State furnishes both the State and the Department of Labor with information they need to compile their respective summaries and, thus, avoid duplication. Data reported are held in confidence, and are not published in any form that would reveal the figures of any individual establishment or company. To avoid duplicate requests for the same information, however, the report may be made available, upon official request, to other governmental agencies having authority to collect similar information.

Under the cooperative agreement, the State agency provides and maintains a mailing list, addresses and mails the schedules, and maintains the necessary contacts with the cooperating establishments. After review and editing by the State agency, and after extraction of essential information by the State agency, the reports or listing tabulations are forwarded to the Division of Industrial Hazards for use in national injury rate compilations.

The Bureau of Labor Statistics supplies the schedule forms, letters of transmittal, and postage-paid envelopes. It also furnished supplementary letters and notes in connection with the editing of the schedules. One person in the State is officially designated as the cooperating representative.

The Division of Industrial Hazards and the State agency arrive jointly at technical decisions, and the Division of Industrial Hazards normally provides an annual work injury conference for the participating States. Each State issues its own releases and reports based on the data compiled.

Standard injury rates constitute the basic measure of work injury occurrence in the United States. They permit direct comparison of the incidence of disabling injuries and of the resulting losses per million man-hours of exposure in different industries, in different areas, and in different categories of plant size. In year-to-year comparisons, they indicate the basic trends in injury occurrence, as well as the industries and areas in which accident prevention needs to be intensified, and measure the success or failure of existing State- or industry-wide safety programs. Most important, they provide the norm, or basis of comparison, against which management can evaluate disabling injury experience in individual establishments.

Another major program of the Wisconsin Industrial Commission is the preparation of workmen's compensation statistics for accident prevention purposes.

Together, these two programs have been useful in setting up safety programs for trade associations and have led to the creation of special committees to study safety problems of certain groups and hazardous industries.

I like to think that everyone in Wisconsin has benefited from the injury rate data: labor, management, and the public in general. Safety or the lack of safety, of course, affects everyone. More specifically, what have we accomplished and what do we intend to accomplish in the near future.

First, through our work-injury rate program, we are giving Wisconsin manufacturing and contract construction industries an indicator or measure of the problems and accomplishments in terms of standard work injury rates by industry, area, size, and so forth.

Second, we have provided the Industrial Safety Steering Committee of the Wisconsin Council of Safety with a comparative work-injury rate record. Incidentally, the manufacturing establishments belonging to the Council have been experiencing an injury-frequency rate about half as high as those which do not belong. We have pointed out to nonmembers that assistance on safety programs is available from the Wisconsin Council of Safety.

Third, we like to feel that our special injury rate statistics and workmen's compensation statistics reports motivated the formation by our Commission of various special committees, most notably a special committee for the construction industry, and another for logging. Labor is also represented on these committees.

Fourth, the idea of working through trade associations is not new. The Industrial Commission and the Wisconsin Council of Safety are working with an increasing number of them. This seems to be an exceptionally good way to reach the largest possible number of employers and employees with a minimum of effort. The Wisconsin Council of Safety, a few years ago, set up a Steering Committee for trade associations as a division of its Industrial Safety Steering Committee. If an association desires to start a safety program, the Wisconsin Council of Safety arranges for a safety institute. Our Statistical Division then prepares and presents a special study of the accident problems and costs in this particular trade group.

Since July 1962, we have also issued special injury reports for the following industries: printing, publishing, and allied industries; lumber and wood products, except furniture; retail hardware, farm equipment and garden supply stores; mining and quarrying of nonmetallic minerals; manufacture of dairy products; local government; State government; contract construction; and various other manufacturing industries.

Tabulations and listings are now being run off by data processing for: State government; hospitals; special governmental districts; county governments; city and village governments; town governments; school districts; logging; dairy products; and primary-metal industries.

You will notice a preponderance of governmental agencies. These reports are in addition to our usual Statewide reports on occupational disease, disability, source of injury and accident type, violations, hearings, and amount of first payment.

The University of Wisconsin also uses our data. The School for Workers, which is a part of the University Extension Division, is very interested in work injuries. Our basic data were made available to the University for research and for various studies, including a special study of work injuries related to several hundred occupational classifications. We also prepare special reports for industrial safety management institutes conducted by the University extension program.

To round out our Wisconsin Industrial Commission's statistical yardsticks, we measure first the results of accident prevention programs in dollars and in humanitarian and performance standards; second, the adequacy of compensation for those who have sustained injury or diseases and for their dependents; third, the degree of physical restoration of the injured; and, fourth, the rate of return to employment.

Our Statistical Division would very much like to undertake new programs, if and when time and budget will allow. For example, we would like to compile standard injury rates for all industries in Wisconsin. We would like to determine the costs of accidents occurring either on or off the job. At the President's Conference on Occupational Safety, in June of last year, the workshop on improved cost data concluded without any expressed doubts or opposition that accident costs are essential elements to consider in effective management planning of safety programs. We would like to analyze information on file and that being generated through quality control and other statistical techniques. We would also like to maintain more adequate administrative statistics. Our Director of Workmen's Compensation and our Commissioners must have adequate administrative statistics for continuity of service, to provide the basis for self-appraisal and to answer inquiries from various sources.

We are already compiling some of the statistics, but we need to know more to do a better job in administering our workmen's compensation law--through the different stages from the filing of first reports to the closing of the case in our files.

Finally, we would like to analyze rehabilitation cases. Here, too, we are derelict in our evaluation of net results. We must certainly try to set up some statistical guide. The past is prologue. Past experience properly applied, of course, is the guide to future safety and administrative activities.

We are fortunate in Wisconsin because our Industrial Commission and the Wisconsin Council of Safety, over the years, have appreciated the value of statistics in planning for accident prevention work and in using such data for delivering messages on safety. Out of 19 improved service goals of our present Wisconsin Industrial Commission for 1965-67, four are directly or indirectly intended to stimulate improved results in accident prevention, through injury records or statistics.

First, extend specialized aid in the area of reports on injury frequency and frequency reduction to additional trade associations and specific industries. Favorable results have been obtained in the canning and logging industries through this service.

Second, establish a more active and effective State employee safety program. At the present time, accidents to employees of the State of Wisconsin will cost the State about half a million dollars in the next 2 years.

Third, emphasize research and statistical data. Collect and analyze only those statistics that can significantly add to the effectiveness of State service.

Fourth, identify companies with poor accident records and interest them in participating actively in safety programs. At present, the people who are most active are the ones with the best records. We need to interest and help the companies with the poor records.

On the national level, the President's Conference on Occupational Safety, held in Washington, D.C., last June underscored the importance and use of accident records, accident cost figures, and safety standards, to reduce the human and economic waste of needless on or off-the-job work injuries. I think the President's Conference has a special message for us here at the 23rd Annual Interstate Conference on Labor Statistics.

It was pointed out that human safety is of prime concern and part of the overall War on Poverty. We need to mobilize leadership in injury and accident statistics. This is especially true when we consider the implications arising from some of the observations made at our 19th Interstate Conference, on which occasion it was stated that workmen's compensation--the original social security program is the least served by statistics of any of the social and welfare programs in the United States, and that this should be a matter of deep concern to the States.

What has been our progress since then, and are we doing the job we should?

One of the principal objectives underlying workmen's compensation, just like our cooperative work injury survey, is the reduction of work injuries. We have goals and objectives. We have them on the national, State and divisional level.

FROM THE FLOOR: To what extent are the safety engineers on the Commission using the workmen's compensation reports for their contacts with the employers to educate them?

MR. GMEINDER: Of course, the people in our Safety Division automatically receive all of the information we put out, and they make individual requests for particular data, but how they are using these data, I just do not know.

FROM THE FLOOR: What cost factors are you using in your program? You touched on that, but could you expand your comments?

MR. GMEINDER: The cost factors we use are primarily these: We tabulate compensation costs, what the indemnity amounted to, and what the medical aid amounted to in compensable cases. These data are transferred to punch cards and, of course, normally printed in many of our tables. We have made "guesstimates" of total direct and indirect costs recently, of nonfarm, nonfederal major industry groups.

FROM THE FLOOR: Have you made any efforts to explore the area of wage loss or anything like that, in addition to those two factors?

MR. GMEINDER: No, sir. However, we have average weekly earnings, and time loss figures. So the potential is there, but that is something we look forward to as our budget will allow.

MR. ROBERT HAGOPIAN (American Insurance Association): In your work with trade associations, have you found these people receptive to the idea of getting into the safety program; and do you have any suggestions as to how the State agencies could help other organizations working in this field--for example, the Associations Committee of the National Safety Council, which I believe has been very active in Wisconsin?

MR. GMEINDER: I personally feel that the various trade associations have been very receptive to our information. As I noted, the Canners Association has used such information for 20 years in connection with their annual meeting. Construction trade groups, the Creamery Association, and other groups have been very receptive. Of course, now the Wisconsin Council of Safety is comprised of private as well as government organizations, so this is one of the reasons that we stress coming to the Wisconsin Council for Safety for assistance. We thus have two sources of help and service.

CHAIRMAN FERGUSON: I am happy to present Miss Esther Espenshade, Chief of the Division of Statistics and Research for the Illinois Department of Labor. Miss Espenshade is a graduate of the University of Chicago and is working toward her Ph.D.

Estimating Work Injury Costs

Esther E. Espenshade, Supervisor
Division of Statistics and Research
Illinois Department of Labor

Injury rates, which have just been discussed, are being used today rather widely in industry and government safety programs.

Also I want to add my endorsement to Mr. Tarrants' remarks on the need for applying methods of inferential statistics to injury rate data.

Although computation of the frequency rates for all disabling injuries or injury rates per 1,000 workers furnish valuable indications as to injury

incidence by industry, firm, and area, the failure to apply the techniques of inferential statistics to injury rate data is limiting their value and perhaps even misleading us because we are ignorant of their reliability. Injury rate data should include at least calculation of such measures of reliability and variance as the standard deviation, standard error of estimate, and the Chi-square test.

In 1949, I was invited by the American Statistical Association to present a paper at their annual meeting on Compensable Work Injury Statistics--the first, and, I believe, the only time that work injury statistics were discussed at a National American Statistical Association meeting.

As I had just begun to work with State injury statistics at that time, my paper treated work injury data in a purely descriptive fashion. Perhaps if we applied techniques of inferential statistics to the analysis of work injury data, work injury data would again become a subject of discussion at an American Statistical Association meeting and perhaps provoke discussion and research which would open new frontiers of knowledge and new avenues for controling occurrence of work injuries.

Although work injury rates are being used today rather widely, we still have need to explore their meaning and reliability, and their significance in safety programs.

Work injury costs, on the other hand, the subject of my discussion, are in the infancy of their development.

As I see it, the estimation of work injury costs has three aspects:

One, the macro--the aggregate or total cost of the universe of work injuries and industrial accidents in a state (or other area). More specifically, my interest was in estimating the cost of all work injuries and industrial accidents occurring annually in Illinois.

Two, the micro--or unit cost of separate or individual injuries. This second phase requires accounting type methods to establish actual records of the cost of individual injuries or accidents occurring in a plant or in other types of business establishments. This is an area of injury statistics that is still largely undeveloped or overlooked in the study of work injuries and as a method for improving industrial safety through explaining their cost factor.

Three, injuries are classified into groups or types primarily according to degree of severity, and securing the incidence and cost of each group or type based on recording the occurrence and the cost of individual injuries of each type. Then, relative incidence of the different types of injuries and their average costs can be used in making over-all estimates of total work injury and accident cost.

Frequently, persons associated with administering State Workmen's Compensation laws and others in industry when thinking of work injury costs often

look at the compensation indemnity or the medical cost (or, in other words, the direct cost) and think of these as a cost figure for work injuries. Many people who realize that indemnity and medical costs are only a small part of the total cost of accidents still use the famous Heinrich 4:1 ratio of indirect to direct cost to get a representation of total injury cost.

The cost of work injuries may be thought of as an iceberg--with compensation (indemnity and medical) payments or the direct costs comprising the visible portion, and with the many indirect costs and the cost of numerous categories of injuries which are not compensable in most States, comprising the submerged portion of the iceberg. Total Cost of Work Injuries in United States is estimated at $5 billion.

By comparison, the Illinois estimate of the total cost of work injuries and industrial accidents was in excess of $600 million. Since Illinois accounts for between 5 and 6 percent of the number of workers in the nation (i.e., non-agricultural employees), we would expect the work injury cost for Illinois to approximate $300 million, whereas our current estimate is $600 million or about 10 to 12 percent of the current national estimate of work injuries. Our proportionately larger estimate of work injury cost does not mean in any sense that work injuries and industrial accidents in Illinois are costing more than in other parts of the United States. Because the Illinois estimate takes into account various ratios and assumptions as to average cost of different types of accidents it is on a different basis than that being used in the national estimates prepared by the National Safety Council.

Comparison of the currently used national estimate and our estimate for Illinois indicates the need for more adequate data on the unit cost of different types of injuries and their frequency of occurrence since we lack complete reports for all types of work injuries. Having these data, we would be able to prepare estimates of work injuries and industrial accident costs, not just "guesstimates" or rough approximations. The importance of the Estimate which we have made for Illinois is that it furnishes the beginning framework or model for building more complete and accurate estimates.

One of the purposes of estimating the cost of work injuries and industrial accidents is to ascertain their economic cost to industry. The $646 million annual cost of work injuries and industrial accidents estimated for Illinois represents about 3 percent of the $20.6 billion paid out as wage and salary disbursements in Illinois in 1963, or about 4 percent of the $15.5 billion paid out to workers covered under our State Unemployment Compensation Act (four or more workers). In other words, a total cost of between $3 or $4 per $100 payroll is involved. This compares with the direct charge of between $1 to $2 per $100 a payroll which is the manual rate for Workmen's Compensation premiums for many of the industries in Illinois. Compensation Indemnity and Medical Expenses were $78.5 Million in Illinois in 1963.

Our estimate of accident cost in Illinois starts with the compensation indemnity and medical expenses, or losses, reported to the Illinois Department of Insurance by all insurance companies writing Workmen's Compensation insurance in Illinois--direct losses totaled $65,130,292 in 1963. Of the $65

million paid in losses by Illinois insurance carriers for Workmen's Compensation in 1963, it was estimated that 71 percent or $46,242,507 was for compensation indemnity, and 29 percent or $18,887,785 was for medical expenses covering both compensable and non-compensable cases.

The Illinois Department of Insurance does not show losses separately for indemnity and medical expenses. Therefore, in order to allocate losses as to indemnity and medical expenses, we used special data furnished by the National Council on Compensation Insurance which showed 183 companies writing Workmen's Compensation insurance in Illinois who are either members or subscribers of the National Council. Data for these insurance companies indicated that for the three latest insurance years medical expenses for both compensable and non-compensable cases (i.e., where no indemnity was paid) was 28.5 percent of the total losses. This gives our ratio of 29 percent for medical, and 71 percent for indemnity.

In addition, there is compensation indemnity and medical expenses for injuries paid by self-insurers. Since compensation indemnity paid by self-insurers was 20.6 percent of that paid by insurance carriers in claims closed in Illinois in 1963, we estimated compensation indemnity paid by self-insurers as $9,506,072, and medical expense as $3,882,762, or 20.6 percent of the amounts shown by insurance carriers, giving a total of $13,388,834 for self-insurers.

Thus, the sum of compensation indemnity and medical expenses for injuries insured by insurance carriers and by self-insurers totaled $78.5 million--$55.7 million for indemnity, and $22.8 million for medical. The total estimated indemnity paid for compensable injuries in Illinois, or $55.7 million, compares with $43.3 million in compensation indemnity reported paid in the claims closed in Illinois in 1963 (i.e., the total amount of indemnity paid for the 40,810 Workmen's Compensation claims in which the final payment of compensation was made during 1963, and in the 1,874 reopened claims).

Thus, the total amount of compensation indemnity estimated as paid on the basis of insurance losses ($55.7 million) was nearly 30 percent greater than the compensation indemnity reported paid in claims closed in Illinois. This illustrates how using State Workmen's Compensation indemnity payments as an indication of total indemnity payments underestimates the actual payments.

The word, "compensation," as used here means the sum of indemnity and medical payments as adopted by a standard definition by the International Association of Industrial Accident Boards and Commissions (IAIABC) and published in 1954 by the U.S. Bureau of Labor Standards. Too frequently in State reports it is impossible to determine what is meant by the term "compensation"--whether it is indemnity alone or indemnity and medical payments. State statisticians should be particularly careful to use the term "compensation" in accordance with the standard definition adopted by IAIABC and the International Association of Governmental Labor Officials.

In the Illinois estimate indirect costs were estimated as twice the direct costs of compensation indemnity and medical expense or twice the $65.1 million paid in direct losses, giving a total of $130,261,000 as the indirect cost.

Similarly, the indirect cost for injuries occurring under self-insured employers was estimated as twice the sum of $9.5 million for compensation indemnity benefits, and $3.9 million for medical expenses, or a total of $26,778,000.

The use of a 2:1 ratio of indirect to direct costs in the Illinois estimate was adopted as a compromise since injury cost studies made in the 1950's indicated that the Heinrich 4:1 ratio was perhaps too high. More recently, cost studies indicate that even this 2:1 ratio is too high. As additional studies are made and data on injury costs are compiled, it is hoped that more accurate data can be substituted for the arbitrary ratio of indirect cost to direct cost.

In our estimate for Illinois, it was indicated that there was a total of of about 50,000 compensable work injuries for which the sum of compensation indemnity and medical expenses (direct costs) totaled $78.5 million, or an average of about $1,500 per injury. Thus, our 2:1 estimate of indirect cost indicates an average cost of $3,000 per injury. This seems to us upon reflection an excessive item. However, indirect costs of injuries can be very substantial.

The terms "direct" and "indirect" costs have more recently been abandoned in favor of the precise terms "insured" and "uninsured" costs. The "uninsured" cost, as listed by Simonds in his study and used currently by the National Council, comprise ten items:

1. Cost of wages paid for working time lost by workers who were not injured.

2. Net cost to repair, replace, or straighten up material or equipment that was damaged in an accident.

3. Cost of wages paid for working time lost by injured workers, other than Workmen's Compensation payments (included as wage loss in Illinois estimate).

4. Extra cost due to overtime work necessitated by an accident.

5. Cost of wages paid supervisors while their time is required for activities necessitated by the accident.

6. Wage cost due to decreased output of injured worker after return to work.

7. Cost of learning period of new worker.

8. Uninsured medical cost borne by the company.

9. Cost of time spent by higher supervision and clerical workers on investigations or in the processing of compensation application forms.

10. Miscellaneous unusual costs. This includes less typical costs which vary widely with individual injuries. Among such possible costs are: public liability claims; cost of renting replacement equipment; loss of profit on contracts cancelled or orders lost if the accident causes a net long-run reduction in total sales; loss of bonuses by company, resulting from delays in work; cost of recruiting and hiring new employees; cost of excess spoilage (above normal) by new employees; and demurrage.

In preparing similar estimates of injury costs in the future, we would recommend that indirect costs be reduced substantially from the 2:1 ratio. Perhaps it would be better to use an average cost in the range of $200 to $400 per injury. Simonds suggests that if a fixed ratio is to be used, it should be a one-fourth to one ratio. He says that "a one-fourth to one ratio would be much more accurate for the uninsured cost of lost-time cases." These elements of uninsured costs can be very substantial. A few hours of lost work time by employees in a department can easily amount to as much as $100; spoiled equipment frequently as much as $100 or more; delays in production schedules and their consequences such as cancelled orders and contracts can be extremely costly and difficult to evaluate, so that an average cost in the neighborhood of $500 could easily ensue a great many injuries, with more in exceptional cases.

Premium expenses or insurance overhead in our estimate was the difference between $105,710,327 direct premiums written and $65,130,292 direct losses paid as reported to the Illinois Department of Insurance, or a total of $40,580,035--a known expense, not an estimate.

Administrative expenses of self-insurers was estimated at one-fourth the compensation indemnity paid by self-insurers, or $2,376,518. This figure is an estimate, and further study should be made of the cost of administering payments for injuries by self-insured employers in order to secure a better estimate of these administrative expenses of self-insurers.

In addition, there is the cost to the State in administering the Workmen's Compensation Acts in Illinois. This was estimated at one-half the Biennium appropriation, to the Industrial Commission, or $803,548.

Not only do employers have costs in connection with injuries, but employees have a substantial stake in the cost of injuries--in the form of wage losses. Loss in wages by injured workers compensated under the Illinois Workmen's Compensation Acts was estimated at $231,544,000 for injuries occurring in 1963. This includes both actual wage loss for time lost due to temporary total disability, and probable future loss of earnings resulting from permanent impairments and a consequent reduction in earning power.

For workers compensated under the Illinois Workmen's Compensation Acts who suffered permanent impairment and fatal injuries, we used the American Standards Association's method of evaluating injuries in terms of time charges, which were the aggregate for all injuries, reduced to a weekly basis, to give the weeks lost or charged. As a result of estimated time losses, we assumed workers injured in 1963 would lose for the weeks charged, the 1963 average

weekly earnings of $108.71 of manufacturing production workers; from this gross wage loss, compensation indemnity paid was subtracted to give net earnings lost of $231.5 million for injuries compensable under the Illinois Acts.

The loss to workers in actual and future wages of $231.5 million is almost half the estimated total cost of all compensable work injuries. Cost to employers, which makes up most of the remainder of the cost, totaled $236 million for injuries insured through insurance carriers, and $42.5 million for injuries occurring under self-insured employers. When the cost to the State of $800,000 is added in, this gives an estimated grand total of $511 million. Even if our estimate for indirect cost is as much as $100 million too high, the total cost of compensable work injuries is in the neighborhood of $400 to $500 million.

Returning to the analogy of the iceberg, the direct cost of compensation benefits as reported for compensable claims closed in Illinois was $43 million (or $55.7 million in indemnity indicated as paid from our estimate using insurance loss data)--the visible portion of our iceberg is only about one-tenth of the total cost. Too often the compensation indemnity costs are the only costs considered in connection with compensable injuries.

Non-compensable injuries under employers covered under Illinois W. C. Acts, were estimated at a cost of $23.7 million. These are the injuries involving lost time of from one to seven days. Since in Illinois only compensable work injuries are required to be reported, and only injuries with temporary disability of more than one week of lost time are compensable, we do not know how many one to seven days of lost-time disabling injuries occur in Illinois.

There is reason to think that injuries involving one to seven days of lost-time bear a relationship to the number of injuries with one week and longer lost time. Most State departments of labor or Workmen's Compensation agencies have recently received inquiries from us in the Illinois Department of Labor for information as to what reports they have on all disabling injuries, and particularly on whether they have a breakdown of the frequency of one-day to one-week injuries, particularly compared to the incidence of temporary disability with more than one week of lost time. Data we have accumulated from the States which have replied indicate that this is roughly a 1:1 ratio, but there is substantial variation indicated between the States.

Therefore, in our estimate, we assumed that there was one non-compensable (i.e., one to seven days) lost-time injury for every temporary disability with one week or more lost-time. Thus, since there were 18,774 compensable temporary disabilities (one week or more lost-time) in Illinois for 1963, we estimated that there was the same number of non-compensable injuries involving a loss of one-day to one-week. Earnings lost for these 18,774 non-compensable lost-time injury cases were estimated at a loss of about $21.74, and assuming an average of three days' disability, totaled $1,224,440 in earnings lost.

Indirect costs were computed for the 18,774 non-compensable lost-time injury cases at an average cost of $100 per case, giving a total of $1,877,400. The $100 average cost was based primarily on Simonds' studies in which he concluded. "There are a number of reasons, however, for thinking the $100 average uninsured cost figure for lost-time injuries is pretty typical."

No lost-time injuries (first-aid and doctor cases) were estimated to be 30 times as numerous as estimated lost-time injuries--also based on the findings in Simonds' studies. Thus, we calculated 30 x 68,774 (sum of 50,000 compensable injuries and 18,774 estimated non-compensable lost-time injuries) giving 2,063,220 no-lost-time injuries--about one injury for every two persons in the employed labor force of the States. These no-lost-time injuries were estimated to have an average cost of $10 per case, giving a total of $20,632,200.

This estimate of over 2 million no-lost-time injuries seemed to us fantastically large. However, Simonds in his book said, "There is no question but that 30 to 1 is too low a ratio to cover the total of both doctor's cases and first-aid injuries in industry in general in comparison with the number of lost-time cases." Simonds also quotes a study made by the Michigan State University Bureau of Business Research; questionnaires returned from companies in eight of Michigan's major industries suggested that there may be 150 to 175 first-aid injuries for each lost-time case. These studies indicate the 30 to 1 ratio is not too high.

At any rate, an improvement in our estimating technique would be to estimate separately doctor's cases and use an average cost for this type of case; then to make a separate estimate of the number of first-aid cases which have generally a much lower injury cost.

In the case of injuries to Non-Covered Employees and the Self-Employed, we estimate a cost of $98 million.

Here we attempt to estimate the cost of injuries to employees not covered under the Illinois Workmen's Compensation Acts. Most of this estimate is derived by securing the ratio of employees and self-employed persons who are not covered under the Illinois Acts, and assuming that these workers were injured in the same proportion as were the workers employed by employers covered under the Workmen's Compensation Acts. However, separate estimates were made for the items compensation, medical, and administrative expenses of employees insured under Federal Compensation Acts such as employees of the Federal Government, interstate railroads, and longshoremen.

The total Illinois employed labor force for 1963 was estimated at 4,221,700. Of these, 3,399,900 were in industries within the scope of the Acts. Employers of about 95 percent of these workers were insured either by insurance carriers or by self-insurance under the Acts, thus bringing about 3,229,900 employees or 76.5 percent of the State's employed labor force under the provision of the Acts. The remaining 23.5 percent, or 991,800 employed persons (chiefly self-employed, agricultural workers, employees of interstate railroads, and the Federal Government) were not covered under the Illinois Acts. Thus, since the 991,800 non-covered workers are 31 percent of the 3,229,900 employees of employers insured under the Acts, the injuries under covered employers were raised by 31 percent to get the estimate of 21,320 disabling injuries to non-covered workers. For these non-covered workers, accident cost comprises wage loss and indirect costs. Except for Federal and for interstate railroad employees there were also compensation, medical, and administrative costs which were estimated independently.

In Simonds' study, he indicates that the number of no-injury accidents may be estimated by applying a 1:1 ratio to the number of lost-time cases. In our estimate, this is the ratio we used. Therefore, with 90,094 lost-time injuries (50,000 compensable injuries plus 18,774 non-compensable, one to seven days, injuries under covered employers plus 21,320 disabling injuries to noncovered workers), and assuming one no-injury accident for each lost-time injury, this 1:1 ratio gives 90,094 no-injury accidents which were estimated at a per case cost of $150 amounting to about $13.5 million.

The cost of no-injury accidents vary widely. For instance, for some years I kept a file of clippings reporting accidents in Illinois. In many of these, the cost ran into millions of dollars--as, for example, a railroad wreck where trains were derailed, tracks torn up, and all railroad travel had to be diverted for a period of days, as well as the loss resulting from damaged merchandise. One such wreck alone could cost millions of dollars. Thus, although our estimate of $150 is only an approximation, the total estimate of $13.5 million is certainly a very small estimate for all no-injury industrial accidents in the State. To this estimate probably should be added a sum for fire damage.

Workers and employers share almost equally in injury costs. When the various elements of accident costs are separated as to cost to employers which compensation indemnity and medical expense, premium and administrative expense, indirect cost of lost-time injuries, and the cost of no-lost-time injuries, our estimated cost for employers totalled $326.5 million for injuries occurring in 1963. The total wage loss to workers was estimated at $319 million. Of this amount, $231 million was the net earnings lost by workers who were compensated under the Illinois Acts; $1.2 million was for earnings lost in lost-time injuries for non-compensable injuries occurring under employers covered under the Illinois Acts; and $86 million was the wage loss for the 21,320 non-covered lost-time injuries. Thus, employers and workers both have a major stake in reducing work injuries and industrial accidents as both bear almost equally the brunt of their cost.

Since most of this conference is centered on the theme of "War on Poverty," and to quote Mr. Hyman H. Bookbinder of the Office of Economic Opportunity, "Everybody wants to get in"--perhaps we should add studies of the effects of work injuries and their cure (i.e., safety programs) as one of the many facets of the "War on Poverty."

Certainly, we need to improve our studies on the cost of individual injuries and to record these findings in such a way that we can secure better data for making over-all estimates, and to establish some more meaningful averages to use for the different types of injuries such as quoted in my study.

I can scarcely close without offering some suggestions which may improve the statistics relating to work injuries:

1. A resumé of what statistics (i.e., types of injuries) are reported, state by state.

2. Comparison of injury rates by industry, from State to State--to answer such questions as: Are injury rates constant year by year; do they show definite trends; are variations random? With the calculation of standard deviations and standard errors of estimate, at what point do changes in injury rates in each industry become significant?

3. Correlation of injury frequency rates, compensation indemnity, and losses paid by industry, and manual insurance rates.

Putting Injury Statistics to Work

Asa Lombard, Safety Director
Bullard Company

I was asked by Dave Pinsky of the Connecticut Labor Department if I would talk to you people. We, in Connecticut, are very fortunate to have Dave as our statistician. He does an excellent job, and industry enjoys cooperating with him.

The only way that we in industry can prevent injuries is to prevent their occurrence, and this is what we want to do. You have often heard about the man falling off of a three-foot stepladder. He picks himself up, and he is not hurt. The next man lands on his head, breaks his neck; this you cannot control.

A good safety man, in my opinion, should not be interested in severity because if he does a preventive job, if he reduces the occurence, the severity and cost will take care of themselves.

I have passed out some charts which may be of some assistance in explaining our safety program to date. I think you will realize that our company hired many new people to meet war demands during the 1940's. Such an influx will affect any statistic, of course. This chart is typical of many companies in the country that I know of--and Bob Ferguson will substantiate that this is typical of what happens when an industry gets interested in a safety program. It gets results.

We use statistics of lost time with the aim of getting the most out of them. You will find, as your lost time declines, the number of injuries will also decline. As you improve your lost-time frequency, then you discover that the number of cases requiring the care of a doctor will drop. We have a high number of doctor's cases in our industry because so many cases require some type of medical assistance.

I would like to tell you a story about an employer that to my way of thinking has probably done one of the outstanding jobs in the country, and this is the approach that the safety man used.

The plant manager had a monthly meeting of all persons under his supervision; they started on a program to reduce minor injuries; and this company got to the point where they wanted to try to prevent unsafe practices that employees commit. They instituted a program where supervisors spend part of their time every day, looking for unsafe acts that employees might commit. It was a pain in the neck to supervisors; they did not like it. At one safety meeting management asked, "How is it working," and the supervisors replied "It's not working." No unsafe practices had been found.

All of supervision was ready to drop the program. Finally, Griffin, who was the plant manager, asked my opinion. I replied that I was probably going to be unpopular, but this was still a worthwhile program, i.e., to get supervision to look for unsafe practices. He decided to continue the program.

This plant went on to establish the present world's safety record in their industry, and I doubt if they average a quarter of an accident a year that results in lost time.

Some of the other charts that we have which you might be interested in present a break-down of the day-shift and the night-shift. We build a ratio of the number of employees to the number of doctor's cases that they have, trying to get the last bit of ammunition that we can use in a preventive program.

Sometimes in order to alert a supervisor, we will compare the number of cases he has against the total for the plant. We point out to him that with his employees he had 24 percent of the first aid visits in the plant, and this was a high ratio.

I was interested in the cost figures that were mentioned by the previous speaker. I, for one, do not know whether or not Heinrich is right. Bill and I used to have discussions about his 4:1 ratio. I do not know the right way to compute these figures.

I have recently come up with an idea of my own, and here again because we have some new people coming into the plant, we are pushing for additional observations as to the cause of accidents. I took the total number of doctor's cases, the two lost-time accidents we had last month, the actual time lost; lost time from work including time spent at the doctor's. I took the total number of first-aid cases and averaged them out on a half hour basis. This meant the Company had lost the production of eight people for a month. If we had 40 people out for a week with our average weekly wage at $150 a week-- the loss of productive wages was $6,000 for the month, or $72,000 for the year.

Now if we take Heinrich's indirect ratio of 4:1 for the indirect cost, this means $288,000 for the year. This is hard to sell in your own plant; you have got to do better than that.

I took machine time, as an alternative. Our machine costs runs from $15 an hour to $30 an hour and if you take $20 an hour as an average; this means the figure was $32,000 for the month, or $384,000 for one year.

In an attempt to develop improved statistics, we have used occurrence charts. We have a casual type of occurrence chart for all injuries, not just lost-time cases. We break this down by type of machine: milling machine, drilling machine, horizontal boring mill, turret lathe or hand tools. Also, we determine the type of injury incurred as well as the extent of the injury.

I said it was a little difficult to make sure whether the statistics we are working with are valid or not. Industry has been criticized and the finger has been pointed at them since there has been little progress made in the last fifteen years in the reduction of accidents. For your information there is a loading factor in the figures which maybe you are not aware of; there is a deductible amount the employee would have to pay if he took care of a non-occupational injury. Instead he comes in on Monday and says, "Last Friday when I was going out the back door, I slipped over the step and I sprained my leg." and you may suspect that the employee was working around in his backyard when the injury occurred.

Now this is what I would like to point out as one of the problems that we as safety people have and one of the things we do in the use of the statistics that you people put together. I do not know how we can arrive at a weighting for some of these problems we have.

Industry on the whole is doing a better job; it is not good enough; we are not satisfied.

CHAIRMAN FERGUSON: I would like to open the program for discussion at this time.

MR. ABRAHAM J. BERMAN: This is more of a comment than a question.

For somebody who has struggled with over-all cost estimates for the State and somebody who does not do it on a more or less regular basis the way Esther Espenshade does, but on an urgent demand for a government safety conference or this kind of thing, I can probably appreciate Esther's problems with this thing better than a lot of the rest of you. It is a job which is extremely difficult because of what I feel is the jungle of workmen's compensation and accident statistics.

You have got to try to put together a lot of bits and pieces coming from many different sources. Esther indicated some of the sources. One source she did not indicate I might mention, is data from the National Council on Compensation Insurance.

MISS ESPENSHADE: I used that. That is how we got the breakdowns.

MR. BERMAN: The National Council has some other data. They are in New York, so I can go up and talk to them. It is not as easy for Esther to do it.

The key point, though, is that when you get all through with this process, you get a big figure. In New York, we ended up with 750 million; it could have been a billion if you add in other factors.

I would like very much to commend this work of Simonds and Grimaldi and any of you who get into the cost estimating business should certainly get hold of that report; it is excellent. The only trouble with it, as Esther indicated, is that it is based on extremely small samples, and a lot of these massive relationships end up with adding a hundred million here and a hundred million there; so your estimate might actually be based on, twelve cases, fifteen cases, something like that, where you get an average cost on a particular kind of industry.

CHAIRMAN FERGUSON: How many cases did you have? Do you recall what you had?

MISS ESPENSHADE: You mean in my data?

MR. BERMAN: Simonds and Grimaldi.

MISS ESPENSHADE: Simonds refers to only about a thousand cases in the industry, and I think the Navy Yard cases were larger.

In regard to Mr. Berman's remarks on this point, the kind of material which has just been claimed company by company for these relationships can be very useful. We can build up tremendous experience if we have records for a number of years on the relationship between doctor's cases or lost-time cases, and this information could be brought together easily by the cooperation of a large number of companies. If we had a thousand or so, we would have a million or two accidents immediately to analyze for these relationships.

MR. BERMAN: Simonds and Grimaldi did a terrific job; it is probably the best piece of research in the field and what everybody has to use when you are doing cost estimates today because it is the best job done, but a great deal of additional information is certainly needed on this point; also, some information on how some of these basic relationships change.

Mr. Lombard interested me, also, in terms of a good safety program. The question remains, however, what are the cost of accidents in his company? It might surprise him, because as a matter of fact in a company like his with a very low frequency rate, that is where the other things begin to mount up, and when he had to he used Heinrich's 4:1 ratio.

MR. LOMBARD: No, I only used that as an example. My figure was higher.

MR. BERMAN: And do you have records?

MR. LOMBARD: Yes.

MR. BERMAN: Good.

MISS ESPENSHADE: This is what we need to bring together.

MR. BERMAN: If more companies did this kind of thing, it would certainly shed a good deal of light on this cost estimating business.

As I said to begin with, cost estimates can be a tenuous proposition. It is costing New York State employers and employees three-quarters of a billion dollars for accidents, a large figure, but then somebody may say, "Look here; nationally, they say it is five billion dollars and New York accounts for 15 percent of the nation; you have only got 10 percent of the labor force; what is the matter with you?"

You may take the whole thing and call for some kind of consistency in estimation by State, but here again it appears difficult to do.

CHAIRMAN FERGUSON: Any other questions you want to ask on this cost picture or any comments you would like to make on it?

MISS ESPENSHADE: I would like to ask how the five billion national estimate was derived.

MR. McELROY: I, of course, cannot give you all of the details of that estimate because we did not make it. It is a National Safety Council figure.

The important element that makes it seem inconsistent with Abe's figures and Esther's figures is the fact that they use a 1:1 ratio for indirect costs. In other words, they compute their direct costs from the compensation material available from the insurance companies and from the various States, and then they estimate the indirect costs as being equivalent to the direct costs.

MR. BERMAN: Is this based on anything, Frank; is this based on anything that we can use as a guide?

MR. McELROY: They are basing their procedures on the findings of Rollin Simonds.

Rollin Simonds was financed by the Council to do the original research. The essential thing to take into account in evaluating the Simonds approach is that he does not feel that there is a universal ratio.

The ratio varies widely from company to company. This is quite understandable, but in any event, in all of his research he found to his own satisfaction--if not to everyone else's--that the 4:1 ratio was out of line. He felt that this was exaggerating the indirect costs substantially.

The Council in the absence of any other evidence finally accepted a ratio of 1:1. They admit right from the start that this is arbitrary. They have not got any widespread or comprehensive figures to support it, but there is such a tremendous demand for figures on aggregate costs. Every speaker in every safety conference we hold in the country wants this figure and as you say, he wants a big figure.

MR. BERMAN: Frank, is this method of the National Safety Council written up; in other words, what they actually did to get their estimate so that if we wanted a State estimate comparable to the national, we could just simply go ahead and use 1:1?

MR. McELROY: I have not seen it published, but I think Gene Miller would be the one to ask on this.

MISS ESPENSHADE: Since the source of this estimate is quoted nationally, I have got a U.S. Department of Labor estimate because it is in their safety bulletin material; it is the National Safety Council estimate, and I have discussed this with Gene Miller.

There is another difference which Mr. McElroy did not indicate, which I did not discuss in any great detail in my report, and that is the wage loss. As you will notice, in the estimate we prepared, it is about 50:50 between the cost to employers and the cost to workers on wage loss. Now, the method we use of putting the time charged on it is, in a sense, tied up with the wage loss in the future for the future value of the man in the reduction of earning power supposedly as a result of his permanent injury, which may or may not occur. He may go back to his old job, even though he has an award for a partial loss of use or loss of use of a member or of a back injury.

There again we ought to look at what type of wage loss we want. Now, whether mine is the right approach or not, I do not know, but certainly the workers in a large State have a large wage loss that is non-compensated, and how much of it is actually represented by this amount, I do not know, but it does get attention of workers when they realize how little the compensation is paying out of their potential and even their current work loss. With Workmen's compensation payments averaging less than 50 percent of earnings in Illinois and about 62 percent nationally, the workers on a temporary basis have a very large stake in the injury program.

CHAIRMAN FERGUSON: Asa has something he wants to add here.

MR. LOMBARD: When I spoke of forty people or eight people being out for a month, this was for cases requiring medical treatment for lost-time and for first-aid. During this time, such people were not productive, so I said that we had a loss of wages, or productive hours on the job, this is a loss in services since the worker was not producing anything, which is a cost of $6,000 for the month or $72,000 for the year for these forty people that were not producing. I said that would be $288,000 for the year. Then I went on to say that our machine time is another loss; when that machine is not working, it is an overhead expense; it is between $15 and $30 an hour because of the cost of this equipment. I said that that amounted, if you took an average of $20, to $384,000 lost production because the machine was down.

MR. BERMAN: This 4:1 ratio, as I recall, is supposed to include the loss of the machine, isn't it?

MISS ESPENSHADE: This is exactly what we should have documented. It would be simple enough in the framework of Simonds' analysis, which I think is good, to build up enough samples to get some real facts on which to make our estimates. It is ridiculous for us to try to make conclusions out of a study as fragmentary as numbers of injuries, with all of the injury records that are kept throughout the United States. If we could just bring this information

together, we would have something that we could feel more assured of. At least Simonds, I think, has done a good analysis of the types we should look for and the problems.

MR. ARTHUR LENZ: I appreciate the need for the speakers to talk in terms of billions for safety programs and accident prevention and for its public relations value, but what I found intriguing is the build-up of that estimate.

The kinds of things that we are presented with in a Workmen's Compensation agency is the legislature coming to us and saying, "If we lower the waiting period from seven days to three days, how much would it cost industry," when we have no information on the numbers involved, so I also am an advocate of more information on doctor's cases, first-aid cases, and in the area where the law does not compensate; in some jurisdictions, the first three days; in others, the first week.

I would like to see more attention paid not to an estimate which we all agree is very flimsy and which as statisticians none of us would accept, but to more discussion about how the data were developed.

I would like to see attention given to those areas which will assist us in answering our legislatures and labor and industry in our own States when it comes to a question of modifying or increasing benefits. I would like the statistical attack to be with a rifle and one that will be directly useful.

MISS ESPENSHADE: Where we have Workmen's Compensation data, why don't we tabulate some of this information for some of the areas anyway on the number of days lost per injury as a distribution? There is hardly a single tabulation that shows any distribution breakdown between the States, so those that have the information and reports should certainly run some distribution studies.

MR. BERMAN: This is probably one of the most useful jobs you can do in terms of pin-pointing the cost of accidents. This is dollars and cents; this influences industry; this is how much it is costing you; it is not just costing you the cost of Workmen's Compensation; it is costing you the cost of machinery that is down; it is costing you many other things.

MISS ESPENSHADE: I would like to ask one question of the man from Pennsylvania on their reports. Pennsylvania has an interesting situation because they have injury rates per thousand workers by industry for compensable injuries and the standard injury frequency rates by industry.

I took a rough check of those, thinking the compensation rates per thousand are roughly two million man-hours against the frequency rates per million. Now, this is one thing on which we can make a comparative study industry by industry that might help the basis of frequency rates in standard.

CHAIRMAN FERGUSON: Can you answer this?

MISS ESPENSHADE: Do we really need two kinds of rates? Does the Workmen's Compensation rate per thousand give us any better information than the frequency rates, or vice versa?

FROM THE FLOOR: As a safety man, we do not particularly care for either one of them. We are going to get cost figures and other factors with which we can impress management or impress employers that there is a problem that needs to be tackled. Rates do not mean much when you are talking to top management. We have got to get this whole field moved into something along the line that Mr. Lombard was talking about.

MISS ESPENSHADE: When you get to the cost rate, take the annual rates given in Skolnik's article as 40 cents per hundred dollars as compared to the four-dollar rate that is the actual cost per hundred dollars of payroll. Take our cost estimate now and relate it to the 15 billion dollars; the total wages in Illinois. Using Skolnik's wages covered, you get the aggregates again.

MANPOWER INFORMATION NEEDED FOR THE PLANNING OF TRAINING AND EDUCATION PROGRAMS

Chairman: Robert E. Johnson
Economist and Actuary
Western Electric Company

There is always one risk that you run when you pick a chairman. He is liable to deliver a speech and take all of the time. I promise that I will not do that, but rather only introduce the subject briefly.

I think we need to take a look as to why we are where we are. Some figures are circulating that today's population has more than a billion man-years more than the same population would have had at the turn of the century, as a result of what medical science has done to prolonging life. About half of these years are in the so-called working age years, with the remainder, of course, in the so-called senior citizen years. I suggest we look at these figures; perhaps they will help us understand some of the problems that we see.

Let me say that for the first time in a number of years the business sector of our society has recognized, too, these problems. Let me tell you about a few events. The National Industrial Conference Board conducted an all-day meeting on public affairs; they discussed poverty, education, civil rights, and unemployment. They set up a division under vice president--Martin Gainesborough, one of the most active economists that we have--just to try to pull together the figures in these fields. You often hear of business leaders, presidents of companies such as General Electric, and Westinghouse, taking an active part in such discussions.

The National Association of Manufacturers is setting up a similar program, to learn what they can do in some communities on the unemployment problem.

The U.S. Chamber of Commerce set up a committee of a hundred businessmen, most of them presidents of major companies in this country, to produce a series of 11 pamphlets, hopefully this year, on the Poverty Program. The first one is available, and I recommend that it be considered as time allows. The Chamber of Commerce is looking to leaders of the academic world to prepare position papers, which will serve as a basis of discussion. So it seems to me that here is another large potential ally in the War on Poverty.

A year ago last May, the President of my company held his annual conference. We asked people from the academic community and some of our own people to discuss the unemployment problem. When the session ended, the President got up and said, "Look, we've got 6 percent unemployed in this country; any time we can solve a problem in the Western Electric Company within 6 percent, we'll get the rest of the way; I want you fellows to get out into your communities and find out what is going on and what we can do to help lower this 6 percent figure."

The backdrop to this program this afternoon is that we have a number of new Federal laws that attempt to assist in this problem of education and training.

We still have, of course, a debate as to what is the scope of unemployment, the 4.6 percent rate, as Otto Eckstein told us may not be a true rate; when another month comes along, it may be 4.8 or even 5 percent. The general opinion, as I hear it among economists, is that it will take a consolidated effort to get to an interium rate of 4 percent.

We have with us today to start the program two gentlemen who will discuss "Research Programs of National Resource Agencies." The first gentleman is from the Office of Manpower Analysis and Utilization in the U.S. Employment Service, Bureau of Employment Security, U.S. Department of Labor; he is Vladimar D. Chavrid.

RESEARCH PROGRAMS OF NATIONAL RESOURCE AGENCIES

Vladimir D. Chavrid, Office of Manpower Analysis and Utilization,
U.S. Employment Service, Bureau of Employment Security,
U.S. Department of Labor

During the last several years, perhaps as never before, there has been wide recognition of the manpower problems in America as they relate to the under-privileged, the under-employed, and minority groups. Not since the 1930's, when much of the pertinent legislation was passed, has so much progress been made in this direction.

If you were in a communist ruled country, one of the most difficult questions you could be asked is, why a Nation as affluent as the United States could consistently have a segment of its population in unemployment and poverty.

I was exposed to this sort of a thing in 1959 in Moscow for about 6 weeks, and in 1961 for about the same duration in three other large cities in Russia. Had the programs existed then that we now ha it would have been so easy to answer many of the questions. It is in this last several years that there has been much attention paid to this problem. Of course, there was the Employment Act of 1946, but it really was no more than a statement of principle which created the Council of Economic Advisors. In terms of the direct manpower programs, the first legislation was the Area Redevelopment Act, followed by the Manpower Development and Training Act and shortly by the Vocational Education Act of 1963.

The Vocational Education Act of 1963 specifically provides that there must be an agreement between vocational education people and the State Employment Service for provision of job market information and other things before money is allotted to the State vocational system by the Office of Education.

There is a need for a closer tie, with those who are responsible for the educational system, for the curriculum, for the kind of courses that are given, and the manpower agency, to assure that the educational programs provide the skills that are needed both currently and, especially, in the future.

As you are aware, there has been a great emphasis on the Youth Program, on providing the needed training for youth. To meet these needs, it is important

to have an adequate supply of information on which to base effective training under the Vocational Education Act, the Manpower Development and Training Act, and the Economic Opportunity Act.

This is so because meaningful training programs must be based on realistic examination of prevailing and future occupational needs in terms of national programs. I will cover this particular subject very briefly and this in terms of the Dictionary of Occupational Titles. As you know, the first dictionary came out in 1939, there was another revision in '49, and a third revision is coming out within a few months.

In the new dictionary, the kind of information that will be provided will be very useful in many ways that were not used before. It will be divided into two distinct parts. The first will be an arrangement of occupations in the order pretty much the way we now have; although there are slight differences, basically it is the same. The second part of the dictionary will be arranged by occupation in terms of worker trades. This would include such things as the amount of training time needed in a given occupation; the needed aptitudes, interest, and temperaments, and the physical demands of the occupation. This has been based on the research that started many years back under a sizable grant from the U.S. Department of Defense.

Also, we are trying to undertake research aimed at the ultimate development of the non-reading test. We have found that it is very difficult to discover individuals aptitudes if they do not know how to read or write, to begin with. You cannot give them a reading test, so we are trying to develop the kind of test that will determine the individual's aptitude through pictures, through a variety of other things other than his ability to read.

Perhaps the subject that is of greater interest to you is job market information, the kind of program that we now have. Several important tools have been developed to provide occupational job market information to meet these and other needs. As a matter of fact, what I will describe has been presented here, before. One of these is the area skill survey. Others are the training service, occupational guides, and industry manpower surveys, and more recently experimentation on job vacancy studies.

Many of these surveys attempt to provide both the current picture in individual occupations, and communities, as well as the future outlook. Area skill surveys deal with a forecast of 4 years hence. This forecast is not only a projection of the demand for workers, but it also relates to the supply of workers that are available now and will be available within the next 5 years or so. Currently, 2 years and 5 years are the longest periods in the forecast.

A determination is made as to whether there will be a shortage or surplus in any given occupation. There have been about 150 such surveys made. They are, to be sure, of different quality and different coverage. Some of them have been used most successfully in developing state programs. For example, an area skill survey in North Carolina has provided the basis for establishing the entire vocational and technical education system.

When the Manpower Development and Training Act was passed, the area skill survey, which takes quite a bit of time to prepare, was supplemented by what is known as the training need surveys. There were approximately 4,000 such surveys made throughout the United States. These have a short-range forecast of 1 or 2 years, and they are done by individual occupation. There may be a half-dozen occupations thought to be shortage occupations based on the data already available in the Public Employment Office.

By the way, I should mention that the demand information for these studies is obtained basically from the employers. Usually, it covers all of the large employers and a sampling of the small employers.

In other kinds of studies we deal with a specific occupation or group of occupations; for example, the North Carolina studies in medical occupations. Right now one is going on in South Carolina, and there are a few others where you select a particular field of work and go into a particular industry to develop occupational information on either State or area bases.

The third kind of information developed for vocational education, is what is known as individual job guides. This program has been in effect for quite a number of years. In terms of the numbers developed and the quality of work, perhaps the greatest effort made so far is in the State of California, under the supervision of one of our panelists, Margaret Thal-Larsen.

The long-range forecasts have developed quite a bit of interest in providing information on current job opportunities. About a year ago, we began to work on this program jointly with BLS so far as the Washington operations are concerned. With the President's and the Secretary of Labor's blessing, we began to see what could be done in developing data on current job vacancies.

Studies have been made twice in 16 areas. The first round of studies was completed quite a few months ago; results of the second round are about ready to be analyzed.

The initial effort in this direction is very encouraging so far as employer response is concerned and also in terms of some of the operational uses of these data. In quite a few areas thus far, a training program has been instituted, based on these data. This has provided some informational tools in some of the shortage occupations for which training can be provided under the existing legislation, especially the MDTA.

We have learned one other thing from this program that is quite encouraging in some ways. In some of the larger areas, the unfilled job openings at the end of the month are very much of the same kind--though not in the same numbers--as those that are showing up in this unfilled job vacancy study; there is a very close resemblance, in terms of the kind of occupations that we now have in the Public Employment Office.

To be sure, the relative numbers are only about one-third, but this reveals more can be done as of now with the existing data in this general area of the occupational job market information, using our existing records.

To this end, we are considering establishing a regular reporting program of unfilled job openings by occupations and the reason for the existence of those unfilled job openings at the end of the month. While we don't know what the national job vacancy figures would be, there is no question if a better measure were available, that unemployment could be reduced and I think it could be a very significant reduction.

We have found, for example, in terms of the mobility of labor that in some occupations, in the same occupations in different areas, you find vastly different relationships between the number of job vacancies as reported in this survey and the number of people registered with the Public Employment Service.

In some of them, if you could just relocate these people immediately, you could achieve a balance in quite a few areas. But in terms of the total, it would not reduce unemployment by one-half, or anywhere near that. Some of the surveys that have been made would provide good clues on the kind of training that can be carried out in individual areas, however.

What are some of the major problems and some of the solutions that we are looking for?

One, in some way we would like to consolidate, and formalize the gathering of information on a systematic basis so that there would be as little duplication as possible. While we have advocated this for some time, we have never received enough funds to proceed along these lines. Consolidation would help some. Hopefully, there should be one of these overall assessments of manpower needs--projections, if you will--in the current employment and the future outlook in individual areas, once every 2 or 3 years.

This information should then be kept on a current basis by such means as job vacancy surveys or in the absence of that, some reporting of unfilled job openings in individual communities so you would be assured that whatever you projected could be corrected if necessary. If you projected a shortage and suddenly something develops and a surplus results in that occupation, you would call it to the attention of the people using this information.

Now, this current assessment can be made every 3, 4, or 6 months. Similar information should, of course, be developed, but perhaps not in the same detail, for the State as a whole. Many of the programs, vocational education and other educational programs, are administered in most States on a school district or area basis rather than a state-wide basis.

There has been some criticism--perhaps rightfully so--of the inability of the employer to project future requirements. We hope to develop a program, jointly with the Bureau of Labor Statistics, whereby the national figures can be translated into local figures as a check on some of this information that is obtained from the employer. Or, we may have the opportunity to discuss this information with the employers, to give them the national viewpoint and thus make it easier for them to make the projections.

This may be accomplished when the Bureau of Labor Statistics develops its national projections. Then the Bureau of Employment Security will try to develop a manual for State use explaining the use of these data. As I understand it, the projections that would be available through the Bureau of Labor Statistics would be to 1970 or 1975.

Hopefully, something like that can be done in terms of using these data for local projections. One other thing is now going ahead. We are making a survey--I won't say a "re-survey"--in several areas which made this long-range projection 2 years ago or 5 years ago. We have engaged an outside group to go to the employers to examine how accurate these projections were and what resources the employer used in making these projections for their individual establishments.

I might say, however, that if these projections were to materialize as forecast, it could either mean that all of the programs that were commenced have taken place, or none of them has taken place. Suppose you are projecting a shortage in any one occupation of a thousand people. The occupation has ten thousand now, and you say that 5 years from now the need is for 11,000, or 1,000 more. If the employer's projection was correct, if the local educational vocational system began training, if the employers realizing that there would be this kind of a shortage began their own training programs, then perhaps 5 years later you will have 11,000 if it were a real projection.

If none of these things has taken place, then you may have at the end of 5 years the same 10,000 that you now have with a shortage of a thousand workers. The question is: Has the projection been accurate or not? That it has been useful goes without saying--if the problem remained the way you forecast it but no action was taken.

Of course, there are many other things that can take place that will change this kind of a forecast, so that if the forecast doesn't materialize, it does not mean that the forecast did not serve a useful purpose.

One other thing that I would like to mention, and this is very important because many statisticians like to make projections. A manpower policy projection of this kind may not serve a useful purpose. When we ask the employer, "What are your shortages now; what do you think you will need in the fugure," we also ask him to assume that there will be available manpower to fill those needs. We are not asking him for a forecast of his employment; we are asking him for the need. Unless you do that, you will never know what your manpower program should be, especially so far as training is concerned.

I will go back some 20 years. If during World War II we asked the employer about the number of workers on the payroll several months hence, he would say, "The same number as I now have; this is a labor shortage area; I probably will not be able to get these additional workers."

We didn't ask them: "What are your needs; how many additional people do you need in order to fulfill your contract working at the same standard work-week."

The point I am trying to make is that there are two kinds of forecasts. There are forecasts of what actually will happen; thus hiding the problems; and there are forecasts of the actual need which would reveal the problems and help those who are responsible for these programs to find some solution.

So far, we have been talking about the need for these data in education. We have recently made a survey of State agencies, State employment services, to find out what kind of requests they have received from the vocational education people under the Vocational Education Act of 1963. We discovered that about two-thirds of the States need a great deal more information than is currently available. So we are faced with this kind of a problem. There will be increasing pressures for this type of information; there will be increasing pressures for both current and future outlook data.

In this sort of work and in any of these programs, one of the things making it extremely difficult is the sort of skepticism and the reluctance of the statistician to provide this information to an individual who will make certain, very specific use of it. The statistician fears that the data may not be accurate. Now, I am sure that the judgment of the individual who gathers these data will be far better than the judgment of the individual who has very little and few dealings with this kind of data. I often feel that the amount of information that is available now in the Public Employment System can provide answers to many of the questions that come up in terms of shortage and surplus occupations, if it were utilized in the way we hope, within the next year or two, when and if we can develop a much better reporting program.

I have covered quite a few areas dealing with this one subject of occupational job market information. There is a great deal of work that needs to be done--Seymour Brandwein and I just came from a conference dealing with this subject. A vast amount of educational work needs to be done both ways. We, frankly, are not always too sure what the conference participants need, and they are not too sure what they want. Much work would need to be done by the educators, the statisticians, and those who are responsible for manpower programs in a locality.

I think that a great deal has been done with the enactment of the Manpower Development and Training Act, which forced the vocational education people and the Employment Service people to get together and work. With the Vocational Education Act, the same thing will occur. However, a close relationship has developed both at the State level and especially the local level. The amount of influence the manpower people will have on a kind of training that will be provided will not be too significant. This in turn means that there could be and will be many people who would be trained in occupations that may be in a surplus supply, and more criticism and talk of the structural imbalance would result.

Research Programs of National Resource Agencies

Harold Goldstein, Assistant Commissioner for Manpower and Employment Statistics, Bureau of Labor Statistics, U.S. Department of Labor

I am also going to talk about the same subject, but perhaps with a little different approach.

My approach to this question of manpower requirement projections for planning training programs stems from years of experience in the occupational outlook research program conducted in BLS. I would like to recount a story that may not be very well known.

We had a postwar labor problems program. One of the main things that we were really concerned about was what would happen after the war; would we be plunged into another serious depression? We hired a staff composed of distinguished college professors to discuss this problem with leading people in industry. They tried to cover all the major industries, all the major companies, to try to find out what was going to happen to employment after the war.

The conclusions were never published, and I think this fortunate, for the reputation of the Bureau of Labor Statistics as well as for public policy in the United States; fortunate, because what they found by talking to these hundreds of big companies about what their employment was going to be several years later was that the companies saw the future in terms of their past experience. If you added up all these forecasts by these companies, we would have been in one winding of a depression right after the war.

We embarked on a somewhat different approach, after that, and I think an approach that makes sense. I will talk about that in a moment, but I am concerned--and I think a lot of us are concerned--that now 25 years later, we are still depending on employers' forecasts or statements of their future manpower needs arrived at by asking them and adding up the results.

If you examine these forecasts carefully, I think you will find that they fall short of being as good as you could want for a number of reasons. One of them is that many employers, most employers, simply do not know what their business is going to be like 5 years or 10 years in the future. They haven't conducted any studies; they may not even have any time to spend answering your inquiry. So they give you any answer that occurs to them.

Any tests, any studies that have been made of what has happened afterwards have shown that no sound agreement whatsoever exists between the projections made by employers and the actual events that occur.

A second thing that makes these types of forecasts less useful in terms of saying something about the future is that each firm is treated as a separate entity. Each firm is treated as if it were in a vacuum, unconnected with the rest of the industry in which it lives and with which it competes, unconnected to the economy and the rest of society. All of the information that we have or that relates to what is happening in that industry goes by the board; it is not consultedat all, unless the employer happens to have been reading studies or to have been making studies himself--and most of them have not.

The third problem is that it costs a lot of money to go around interviewing and polling numberous people, so we cannot repeat these surveys as often as we ought to in order to see what the future is going to bring. Conditions do change and you have to check your forecasts frequently.

Finally, one other comment--and I think Bill Chavrid addressed himself to this--when you go around asking people what is going to happen in the future, you don't know what you have; you don't know what assumptions he made; you don't know whether the assumption that this man made is consistent with the assumption that the other man made down the street. Unless you are very precise, as Bill pointed out, you don't even know whether he is giving you a forecast of how many employees he thinks he will have, or an estimate of his needs.

This is very important. What we should be dealing with is not forecasts of what will happen, but estimates of manpower requirements. I don't believe we should be forecasting at all; I don't believe we should be forecasting the supply of labor in any occupation except for illustrative purposes. The whole purpose of this activity is to try to adapt our manpower supply to our needs by training programs, and by vocational guidance; if we can't get enough people through increasing our training to meet the need, then maybe pointing this out to industry, will lead them to make better utilization of the people they have, and thus modify their manpower requirements.

The minute that you contaminate the information that you are getting by considerations of supply, you are losing the value of this information as a guide to policy programs and action.

If we set aside an attempt to discover future manpower requirements, for the purpose of basing training programs, by polling employers for their judgments, what do we do? The Bureau of Labor Statistics and the Bureau of Employment Security are working together, as Bill has said, toward what I would call a more analytical approach.

Some of the hallmarks of this analytical approach are these: First of all, we assume that there is an interrelated economy in the United States. This seems like a pretty obvious assumption to make, but if you are getting an atomistic response of employers, you are not really making that kind of assumption; you are not putting the correct assumption into effect.

This assumption means: For those industries which sell to a national market--and this means most manufacturing industries, the transportation industry; national industries like the insurance industry; wholesale trade; mining--for those industries that sell to a national market, their employment and manpower requirements are going to be determined by the whole national market for their product. You then can comprehend this problem by studying the potentiality of this national market.

For those industries that are not related to a national market but to the local population and its consumption, for example, retail trade, State and local governments, school systems, construction, and a number of others, you have

to look at the local population and its growth, the amount of income that will be available in the community and changes in those, to get a clue as to the future manpower requirements.

Now, whether the industry is national or local in terms of its market, it has certain other characteristics in common with plants in that industry in other communities. For one thing, each industry has its own technology, whether it is a steel plant in Youngstown, Ohio, or in Baltimore; it has a common kind of technology; therefore, all of the technological changes going on in the steel industry affect all of those plants. If you can get a handle on that problem, you have insight into the problems of steel plants in each community.

Another thing that every plant has in common with other plants in its industry is, of course, the occupational composition which is related to technology. The steel industry uses certain kinds of workers; the restaurant industry uses quite a different group. Information collected in one community can help you in another community.

A third major assumption that we are making concerns the U.S. population as a whole. This sounds self-evident; but it is important in this respect. I have just illustrated how local population growth can be very important in making local projections. Each State has to make some assumption about its population growth and about the effect of migration--whether there will be net in-migration or out-migration--and what the age and sex composition of those migrants will be. Clearly, we get an education program in the United States that would be incoherent and inconsistent if different assumptions were made by the different States, by the different communities as to their population growth and migration picture; for example, if California assumed that all the migrants would be coming to California and the State of Florida assumed that all the migrants would be coming there. Again, national studies of population growth and migration can shed light on the problems of each community.

This is not to say that local people do not have a great deal of information that would be helpful to you, nor is this to say that somebody sitting in one place, whether Washington or New York or any other place, can make or has the omniscience to make all the projections of population change, all the projections of employment requirements by industry for the country as a whole. This is obviously wrong.

The problem is to put together--as Bill Chavrid has said--information and judgments that you can bring from the locality with what you can learn at the national level and by analysis of national trends.

The way we propose to move ahead to make it possible for the States, the regions, the local areas, to project their manpower requirements as the basis for estimating training needs, is to prepare two kinds of information for them. First, information collectible nationally or analyzed nationally which may be useful to them as background for their work in the region, State, or area; and, second, suggestions and ideas on how to do this.

These are some of the things that we are thinking about bringing together as a publication of the U.S. Department of Labor for this purpose.

First, projections of the population of the United States published by the Bureau of the Census both for the country as a whole, by age and sex, and also by State will be used.

Second, projections of the labor force made by the Bureau of Labor Statistics for the Nation as a whole and projections for the various States consistent with the Bureau of the Census population projections will be added.

Third, projections will be included of employment by industry to 1970 and 1975, made in the BLS by a variety of techniques with as much emphasis as possible on getting industry detail in those industries which I characterized earlier as depending on a national market for their growth.

Now, in making projections by industry, a number of resources are available to us. First of all, we have something like 20 years of experience in the occupational outlook research program in which we have been doing this. Second, there are a great many new developments in analytical techniques, projection techniques, developments by university people, by private research organizations, which we hope to draw on. There is a lot of this work going on in foreign countries.

One of the most significant new techniques and one of the most promising is the interindustry analysis approach which provides a sophisticated technique for moving from projections on consumption for each product to projections of the amount of production in each industry that is required in order to meet aggregate demand for the product in question.

Let me illustrate by saying that if you can project the number of automobiles purchased every year by consumers, on the basis of the number of families, the average number of cars per family, rising income levels, trend toward more and more people moving out to the suburbs, and the patterns of consumer credit, you can use the interindustry input-output technique to estimate how much steel will be needed to produce those automobiles, how much rubber, how much coal, how much railroad transportation, all the way down the line, so you can use this approach as a powerful tool to analyze production requirements in each industry.

These industry projections will require more work on the part of the BLS especially with the changing technology in each industry and factors affecting technological change. We hope to be able to use all this information. These studies show, for example, what happens when automation is introduced into a plant and how fast automation is being introduced, and so forth. We hope to draw on this information, too.

A fourth thing that will be included in the publication is projections of employment in each occupation nationally. These projections are especially important for agencies like the Office of Education which has to make some appraisal of the whole picture. Are we training, are we educating enough people in each occupation through the work we are doing?

It is also important to provide information for appraising the output and the manpower requirements in many occupations which have a national market, particlarly among the professionals. You cannot look at each community; you cannot expect each community to train its own engineers and physicians, and so forth. They don't do it. The engineers and physicians and the other professional people move from one area to another. They go to school here, and they work there, and in this case you need nationwide projections of manpower requirements as a base for your training programs.

A fifth type of information that we will be providing in this publication is occupational composition patterns for each industry. We have these patterns developed for about 130 different industries with a good deal of occupational detail based largely on definitions in the Dictionary of Occupational Titles. We are now working with funds provided by the Office of Manpower, Automation, and Training, to develop estimates of these occupational patterns for 1970 and 1975 on the basis of all of the information we have been able to get on the changing occupational compositions in each industry, how technology affects it, and so forth.

These will be rough projections, but I think they will be useful in arriving at projections of employment for occupations. If we can project employment by industry and the occupational composition patterns for future years, we can make estimates for employment for occupations across the board.

These occupational composition patterns will be useful, as I suggested earlier, in the locality and in the State. I think that, for most industries in any locality, occupational composition is going to be just about the same as it is in that industry nationally. Therefore, I think, it would be wasteful to go around to all of the laundries, all of the cleaning and dyeing places, all of the restaurants in the community and laboriously collect information on their occupational composition when a national pattern would give you a pretty good estimate of how many waiters, how many cooks, how many laundry operators, how many truck drivers, you have in the community.

I would suggest that the collection of occupational employment data locally should be centered on those occupations and industries which are important and significant in the local community. When you do that, you will be able to cut down your work load by more than half, I would guess.

Finally, one other very significant type of information we hope to put into this publication would be tables of working life which we have developed at a national level. These tables can be used to estimate the number of people in an occupation dying or retiring, withdrawing from the labor force, over the next 5 or 10 years, on the basis of the age composition of the members of the occupation.

These tables need some further refinement. We use them now, but it would be very important to refine these on the basis of research on the differential occupational death and retirement patterns in the various occupations.

This last comment, the need for refinement and improvement, applies to everything I have been saying.

To summarize, then, we are moving toward a more analytical approach, making it possible for States, areas, regions--for many manpower studies you need regional summarizations--to take advantage of national information to develop their projections of local information. I think that anything we put out in the next year or so will have to be subject to frequent revision, but it will be a step forward. I am very glad to see recognition of the need to move ahead in this direction, on the part of a number of the State people, the State Employment Security people. I know that the State of New York and the State of California have both done a lot of serious work in this type of analytical projection method, and I am very delighted to see that they are represented on the program today.

Chairman Johnson: Thank you, Harold, for giving us some interesting insights. I think you could have added that the packages that our two previous speakers have been alluding to will be helpful to those of us in industry, too. It doesn't stop with the State and county. We are struggling with the same problems. We also would like to know, and sometimes I have as many as five different estimates of the number of employees of the Western Electric Company five years hence on my desk with management asking me which one they should bet on when they are setting up training programs, recruiting programs, et cetera. Much of this material will be helpful to some of us.

The Canadian Experience

Jack P. Francis, Director
Economics and Research Branch
Canadian Department of Labour

In Canada, as in the United States and many other countries, there has been a tremendous expansion of education and training programs in recent years for young people, and for adults. This expansion has generated an urgent need for research and information which will provide some guidance for policy decisions about the kind of training which should be provided, how different types of educational and training programs should be related, and the effectiveness of the total effort. I shall mention some of the work which is being done in Canada.

In talking about the kinds of research needed to support decisions about training policies and programs, it is important, from an economic point of view, to distinguish between two rather different objectives of educational and training policy. The first objective, long-run in nature, concerns the amounts and kinds of education and training which should be given to young people so as to maximize their chances of surviving in a rapidly changing and relatively unpredictable labour market.

The important feature of this situation is that considerable expenditures have to be made far in advance of the returns that can be expected. This is basically an investment type of expenditure and its primary concern, again from an economic point of view, is to contribute to and facilitate economic growth. Here we need to know how much investment in education and training is necessary

and what kind of investment it should be, in terms of the broad structure of the educational and training system. Answers to this kind of question require assumptions about the goals of economic growth and development in the period with which one is concerned.

The other major objective of training policies and programs is relatively short-run in nature and is concerned with the functioning of the labour area. In this case, the primary concern is to provide the kinds of training needed to help workers change, modify, and improve their skills and knowledge as employment and job requirements vary. Here, the problem is basically one of mobility rather than growth, and the task is to facilitate the process of occupational and industrial mobility by providing the required amounts and kinds of training at the right times for the right people in the right places. This kind of training is an instrument of labour area policy and is primarily concerned with adult workers.

Education and training is growth-oriented and primarily concerns youth; therefore information is needed on the broad characteristics of future manpower requirements of the economy. The task of providing such information in Canada has recently been helped significantly by the newly formed "Economic Council of Canada," which has just published its first Annual Review entitled Economic Goals for Canada to 1970.

The Council examined the problem of simultaneously achieving the goals of full employment, a high rate of economic growth, a reasonable stability of prices, a viable balance of payments, and an equitable distribution of rising incomes over the next 5 years. Given the population and labour force expansion likely in Canada over this period, the Council estimated annual growth rates for total national production and productivity, and set forth its view of the structure of the demand for goods and services which it judged would exist in 1970 if the goals were realized.

This analysis, apart from providing a broad framework for the development of economic and social policy, has provided the basic information needed for a picture of future manpower requirements in the nation as a whole. Within this framework, we are now engaged in working out manpower requirements data consistent with the projections of the Economic Council of Canada.

The task consists of converting the projections of gross national product by sector to estimates of employment by industry and, then, to estimates of employment by occupational groups. Of course, it will also be necessary to develop estimates of potential replacement needs on a comparable occupational basis, thus making it possible to assess total potential manpower requirements between 1965 and 1970. To complete the picture, estimates of probable new manpower supplies for the same occupational groups will also be developed on the basis of population growth and the size and character of the educational and training system as extrapolated from past trends. My description of the task to be accomplished has been greatly simplified, but this groundwork will make it possible for us to set forth the implications of the trends in requirements and supplies for earnings, for education and training, for immigration, and for mobility.

This key project, which will be based on a very rudimentary model of the economic system, will be a continuing and, we hope, an increasingly sophisticated on, as time goes on. To improve out techniques, we are trying to build a series of specific research projects which will provide more information and help to improve the reliability of the conclusions.

One of the basic needs, for example, is to develop an occupational classification system which is training-oriented rather than job-oriented. Such a classification system needs to relate occupations on the basis of their education and training requirements, so that the occupational categories used in a manpower forecasting model of this kind may be as meaningful as possible in relation to the structure of the education and training system. Here we will be relying heavily on work which is already going forward in the United States.

Another important need is for an up-to-date input-output matrix of the Canadian economy. Such a matrix is a basic tool for this type of analysis. Important work on this task is already in progress in the Dominion Bureau of Statistics in Canada. We also need to know much more about the rate at which capital is likely to be substituted for labour and about the substitutability of various kinds of manpower. Much work has yet to be done in this latter field, but it is an essential area of research from the viewpoint of training policy.

The second major objective of training policies and programs, as previously mentioned, concerns the functioning of the labour area. The essential task here is to provide the kinds of retraining, further training, and basic educational upgrading which will, on a least-cost basis, make it possible for existing labour supplies to move into vacant jobs. The perspective here is relatively short-run, and the need is to have advance and current information on the kinds of manpower which are or may be unemployed, and on current and emerging job opportunities.

This is the matter of labour area information, and discussion, to be realistic, must recognize the important role of the employment service in the development of such information. In Canada, the National Employment Service has just recently been transferred to the Department of Labour (it was formerly part of an independent Unemployment Insurance Commission), and important steps are now being taken to strengthen and develop its great potential for providing information on labour conditions. One of the priorities here will be to develop a system whereby disruptive labour shortages can be anticipated so that training authorities can be alerted and the appropriate training courses initiated as early as possible.

There has been some discussion in Canada about the possible need for comprehensive job vacancy statistics. Our feeling, at present, however, is that there are unsolved problems of definition and of objective reporting which do not make the development of any broad statistical program in this field worthwhile at this time.

The basic problem with labour area information on the demand side, it seems to us, exists at the level of the individual company or establishment. Generally, employers in Canada have made considerable efforts to anticipate their

markets and to plan their capital investment; they have done very little to anticipate and plan for their manpower needs. Until the calibre of information which is available at this source is greatly improved, public efforts to strengthen labour area information services will be operating under a handicap. In this connection, the Economic Council of Canada is studying the amount of work done by a selected number of large companies to anticipate their manpower requirements and the methods employed by them in doing so. One of the purposes of this study is to accumulate information on how this can best be done by individual companies so that the techniques employed can be brought to the attention of other employers throughout the country.

It is important to have detailed information on the characteristics of those who are unemployed (and ideally on those who are threatened with unemployment in the near future) so that training courses can be designed with regard to the educational and training levels of those individuals. Much information of this kind, of course, comes from the regular operations of the employment service; We are also planning to deepen this knowledge by carrying out, on a sample basis, a national survey of the characteristics of the unemployed. The first of these studies will be made this fall, when unemployment is seasonally low in Canada, and the second this winter, when unemployment is at its seasonal peak. We hope these surveys will be carried out from time to time, so that we have periodic information in considerable detail regarding the identity of the unemployed. Thus, training policy could be formulated not only in relation to forthcoming job opportunities, but also by taking into consideration as fully as possible the characteristics of those who are to be trained.

It is also important to develop a method of evaluating training policies and programs. Obviously, if we can find out how successful current training policies and programs are in helping people to survive more successfully in the labour market and to improve their incomes, then we are in a better position to make the whole training effort more successful.

This is a difficult field of research because it almost always involves longitudinal studies extending over considerable periods of time. There is, however, one project now going forward in this field which we call "The Career Decisions of Canadian Youth." In this study we are attempting to identify and measure the influence of the school system--in terms of kinds of schools, course programs and curricula, types of teachers and teaching arrangements, and the kinds of vocational guidance, counselling and other services which are available to high school students. Briefly, what effect, if any, is the school system having on the vocational and educational goals of young people? Is it contributing to their vocational maturity in a realistic way or not? Is it doing a better job for some kinds of students than for others? What are the different effects, if any, of vocational and technical course programs as compared with academic ones?

This study will be a large one for our country. It will be based on a sample of between 350 and 400 schools and 125,000 to 150,000 students. It will include the administration of a number of questionnaires to each student, (a basic

questionnaire on socio-economic characteristics and attitudes, plus two psychometric tests), and a questionnaire to each teacher, guidance counsellor, and principal. Enumeration will take place twice, first this fall and again next spring, so that changes over the school year can be measured.

Since this study will give us a basic sample of the present high school population, we also intend to follow the individuals in the sample after they leave school and enter the labour force. This, of course, is an extremely difficult undertaking, but we hope to accomplish it by arranging for the advance assignment of a social insurance number to those in our sample. In this way, information on their future employment and unemployment experience can be secured automatically from our social security records. Such information will be invaluable for future follow-up and evaluation studies.

I have mentioned some of the needs for information to plan training and education programs, and have indicated a few of the steps being taken in Canada to meet these needs. There is a growing awareness and concern throughout Canada about the development of information of this kind, and both provincial and Federal governments are responding to this concern by shifting research activities in this direction and expanding their total research expenditures. As this happens, it will be important to establish some mechanism which will provide a picture of all the research activities and plans which are under way or being developed. Such a mechanism will serve an important purpose in helping to avoid duplication and in providing a basis for greater co-ordination of the total effort. In fact, a clearing house of this kind is being established by a Federal-provincial statistical and research committee of the Canadian Association of Administrators of Labour Legislation. This committee is also helpful in identifying basic research needs that are of common interest, and in proposing action, to provincial and Federal government authorities. These are important developments in a situation where needs are many and urgent and where competent resources are scarce.

Mr. Chavrid: Mr. Goldstein, in your projection for 1970 and 1975, what will be the base year from which the projection will be made?

Mr. Goldstein: 1964 or 1965.

Mr. Chavrid: I think there was some misunderstanding as to what I said.

When we ask the employer about his anticipated employment need, we ask him for needs, not levels. At all times, the instructions to the employer are very specific. The question is whether we get the information back in those terms.

Right after World War II, if we had taken the employer forecasts of requirements, we would have come out with much the same kind of unemployment figures that developed in 1946-47. Employers had a difficult time in recruiting and keeping workers on the payroll during World War II; they were continuing to keep them on the payroll even though there was no actual work for them. Economists, on the other hand, thought that the employers would be more rational and would lay off those workers they didn't need; thus, they estimated a much higher rate of unemployment.

Of course, had the employer forecasts been taken, there would not have been the Employment Act of 1946, because the levels of unemployment would have been relatively low; however we started this program, and I think that gave us the real reason for the passage of the Employment Act.

Mr. Hyman Alterman: Bill has suggested that we ask the employer about his future employment needs. This may give the impression that in each organization visited there is only one individual who can supply the information we are after. If we are to ask an economist from within the company as a representative of the employer, he might make an estimate based upon general estimates of growth rate for the industry and perhaps for the country. If we ask the responsible person, who in this case happens to be the personnel director, he might project his immediate needs. If the person answering for the employer also happens to be responsible for sales, he might project his sales quota which is set for him as a matter of company policy. If we ask an executive of the company who has in his mind hopes for future automation of his operations, he might give a different estimate.

I venture to suggest that all of these people within one company sitting together at an informal conference would not be likely to agree with the same estimate of future growth, particularly if they are separated into as small a unit as an occupational group. What we are really getting in our answers is a mix of different opinions from different people representing the employer. If at all feasible, we could make it part of our policy to try to seek out a specific type of responsible person, so that if nothing else, we would be able to understand the underlying bias inherent in these particular estimates.

Mr. Chavrid: There have been surveys made sometime ago on this kind of projection of total employment, and as I recall, the best projections that were made in these individual companies were not by the top executive, nor by the

lower executive, but by a junior executive who took it upon himself to seek out the information from all those concerned from different departments in the company.

We are now conducting studies specifically on employee projection by occupation, and we hope to find out who has been making them, who is making them, and where the best sources of information are in the establishment.

Mr. Seymour Brandwein: The point you make is sound. It indicates one of the obstacles still to be overcome in turning to employers for the development of projection data.

I think you will realize that, despite the limitations of turning to employers, there is an additional function involved. Part of the purpose of government as an employer is to encourage the development of manpower planning within each company and to raise the degree of attention and concern in an area which--with many notable exceptions among larger companies--has attracted little attention. One has to go back only 10 or 12 years to recognize there were no comprehensive and reliable data on forecasts of capital expenditures. It was only by working with a cross-section of representative employers that attention could be drawn to projections in their own organizations that would lead to responsible findings. Hopefully, over a decade, we might reach the point where each company would take account of some centralized or standardized approach to manpower projections.

Mr. David Mann: Do your manpower forecasts and projections of manpower needs and training contain indices with respect to minority group training or minority group employment by occupational mix?

Mr. Goldstein: We are not trying to make any projections of requirements by race or age or any personal characteristics for very good reason.

I do not believe there is a viable concept in a democracy of requirements of workers by race, but we are trying to get some line on a question that is bothering a number of people.

It has been observed that the trend in employment in some of the farm and low-skill occupations has been downward. Many of the projections that have been made call for a further decline in the proportion of low-skill jobs, particularly in areas of employment for Negroes.

The question is: to what extent would a further decline in the proportion of jobs held by Negroes create further employment difficulties for them? I think an illustrative projection could be made, assuming the same proportion of whites and nonwhites in each occupation as now exists. What would happen to total employment of whites and nonwhites? Would there be a gap in jobs for nonwhites or Negroes?

This kind of an illustrative projection will be made, and I think it will show us if indeed there would be a decline in job opportunities for Negroes.

It will indicate, among other things, the need for opening avenues to other kinds of employment opportunities for Negroes through education and reduction in discrimination.

Mr. Charles A. Roumasset: Mr. Francis, regarding your survey of the influence of the school system on occupational choice, I do not see quite how, in the period of 8 months or a year, you can determine the influence of a whole set of forces which have extended over the entire life of the student. I do not know what you can accomplish with a complex questionnaire. A simple one addressed to the young man in the labor force asking "Why and how did you make your choice?" would suffice.

Mr. Francis: The independent variable is the school system with its various characteristics. The universe of schools will be sampled on a stratified basis. We will pull out and analyze data obtained for different types of schools, different types of course programs, for teachers with different backgrounds and different types of training, and schools with various kinds of vocational guidance services. All of the other variables, such as the individual student's background and the type of family and community from which he comes, will be regarded as constant in the study. We recognize that what we are dealing with is a phenomenon that is the result of a great many factors, but we want to look at only one of these.

The set of factors we want to know about are those in the school system; therefore, these are the ones we will concentrate on; the rest, we will hold constant. To do this, the usual approach would be to take a group of students at the beginning of whatever school program you had in mind--in this case, high school--and follow them through to the end of the program. This is a 4 or 5-year operation, so we plan to telescope this period into a year by measuring the progress of students in all grades of the high school over the period of 1 school year. Our analysis will then link together these changes for grades 9 to 10, grades 10 to 11, grades 11 to 12 and so on. Thus, we hope to telescope 5 years into 1, and in doing so focus on just one set of variables. We plan to focus on the school system because it is something about which we can take action most directly.

State Needs for Manpower Information in the Field of Occupational Training and Education

Charles A. Pearce, Director
Division of Research and Statistics
New York State Department of Labor

This afternoon I want to look at some of the needs for information in the field of manpower training and education that are suggested by our experience in New York State. In doing so, I'll disregard the need for data on job vacancies and job openings, of the sort required by the Manpower Development and Training Act and related short-term training programs, and concentrate on broader and longer-range needs, particularly requirements on the manpower demand side.

The first is a general need: one should have data that give an orientation--a perspective--on the kinds of skill required for future public and private employment. The data called for consist of projections of the number of jobs by occupation, including, as an intrinsic element, estimates of the impact of changing technology on skill needs.

Estimates of this sort--both Statewide and for areas within the State--are very high on New York's priority list for research. In 1960, we published Statewide estimates covering the period 1960-1970. A revision and extension of these estimates, and local area estimates, is being prepared now.

The orientation function of demand data is important, because the impressions that governors, legislators, department heads, budget planners, school officials, lay education groups, and industry and union officials have about future skill needs help to shape the magnitude and kind of educational programs that are proposed, adopted, and financed at Federal, State, and local levels.

If there is one thing we can be certain of, it is that almost everyone speaking about manpower training and education will make some assertion about the kinds of job skills needed in the future.

The impressions people have about occupational education and training are important; therefore, it is necessary that we provide them with good projections and sound interpretations. If good estimates are not available, poor estimates or vague and superficial generalizations will be used and repeated until they take on the appearance of authority, or, it will simply be assumed that the future will be like the present.

Misinterpretation concerning future skill needs can easily result not only from poor projections but also, as frequently happens, from publicizing projections without benefit of the kind of realistic interpretation that the manpower statistician or economist can give the data.

An example of inadequate reading of the data is found in assertions that automation, space-age technology, and so on, are rapidly carrying us into a situation where a high-school education will no longer suffice as preparation for a job; that practically everyone will need some sort of post-secondary education or specialized, protracted job training.

One cannot talk with any assurance about the situation 50 or even 25 years from now, but insofar as we can glimpse the picture of the next 10 years, this view is not realistic.

Actually, we estimate that jobs of higher skill accounted for about one-third of the employed labor force in New York in 1964, and probably will not exceed 38 percent, or thereabouts, in 1975. I include here professional, technical, managerial, and craftsman jobs. The situation in the nation as a whole probably is not much different.

The relatively lower-skill jobs, such as those held by clerical workers, sales people, operatives, service workers, laborers, and farm workers--jobs that usually do not require post-high-school education or protracted job training--will continue to account for the majority of positions. We estimate that, including both replacement and expansion needs, up to two-thirds of all jobs to be filled during the next decade will be in this lower-skill category.

Especially important to proper orientation about job needs during the next 10 years is the expected increase in jobs in the service category--domestic workers, hospital attendants, practical nurses, waiters, kitchen workers, janitors, and also protective service workers such as policemen and firemen. The rise in these service jobs can be attributed in large part to population growth, urbanization, and higher living standards.

Some persons have the impression that modern technology will require a vast expansion in technical manpower, especially at the technician level. It is true that job needs in technical occupations will increase more than in other fields; but this does not mean that technical occupations represent a large demand for manpower or a field of many employment opportunities.

Our recently completed New York State survey of technicians and technical specialists shows them to be only about 2.5 percent of the total employed labor force. Even when professional engineers and scientists were included with technicians, their combined number was only about 5 percent of the total. Despite the increase that is expected to take place (over 50 percent in the case of technicians and technical specialists, somewhat less in the case of engineers and scientists), at the end of 10 years, total employment in these technical fields will fall considerably short of 10 percent of employment in all fields.

I suspect that this kind of misinterpretation of the manpower situation may be resulting, not in overemphasis on technical education, but in inadequate attention to meeting manpower needs in the lower-skill categories (especially in service occupations); and also perhaps in a failure to recognize that for many persons, in the labor force, there is little prospect of obtaining jobs above the lower-skill levels.

Another use of data on manpower requirements is to help identify the need for vocational, technical, and professional education facilities at the State and local level.

Almost any statement justifying or favoring an expansion of educational facilities will include some kind of manpower projection. Thus a report made several years ago on the demand for higher education in New York State cited the manpower projections of the State Labor Department to support the statement that there would be a demand for all the highly trained manpower that would be turned out following an enlargement of the State University--an enlargement needed to accommodate the vast increase in the number of young people.

This kind of statement is not an easy one to document, since it requires a matching of projected needs and projected graduations on a field-by-field

basis. What may be true in one job area may not be true in another. But outside the occupational fields of teaching, engineering, and science one does not often see careful comparisons of this kind.

When a proposal is made to expand facilities for vocational and technical education, manpower-requirement data are regularly referred to. However, it is my impression that such data do not figure in any primary way in reaching conclusions concerning the need for educational facilities; rather, they serve in a secondary role as points for checking other indications of need.

This, at least, is my impression of current studies and recommendations for establishing vocational and technical education facilities in 24 areas (mostly multicounty areas) throughout New York State. These studies, which were sponsored by the State Education Department, were carried on by local groups, usually with the help of a consulting firm or of university personnel. In each case it was concluded that new facilities were needed.

An examination of half of these reports showed that -

...Each included some kind of estimate of current employment by occupation.

...Some, but not all, included or referred to long-range projections of manpower requirements. Several cited the State Labor Department's Statewide projections, made in 1960.

...One cited figures from the projections in Manpower Challenge of the 1960's, by the U.S. Department of Labor's Bureau of Labor Statistics.

...Two developed local projections based on a simple extension of 1950-60 occupation trends, as shown by the Census.

...A few referred to the 1963 or 1964 manpower reports of the President but included no figures from this report.

...One attempted a more sophisticated projection, utilizing a Statewide industry-occupation matrix, along with local industry projections.

...All gave figures based on surveys of local employers. Some gave employer-reported figures as to the number of workers now employed, by occupation, and the number that employers said they would employ 3 or 5 years from now; sometimes replacement needs were included. Other reports simply cited employer opinions about shortage occupations and growth occupations in the area.

...In addition, employers usually were asked to indicate what subject fields the vocational-education program should cover, with respect to training for entry jobs, for upgrading, and for retraining persons with obsolete skills.

...Some reports also included opinions of officials of unions, of employer associations, and of local employment offices as to manpower and training needs and as to the value of vocational education.

...All the surveys projected the number of students who would not be going to a regular college. They also ascertained from 10th to 12th grade students, and from recent dropouts, their interest in vocational education, and the subject-matter fields, if any, in which they would like to take vocational courses.

...All the studies also canvassed parents to find out whether they approved of their childrens' plans and interests, and to ascertain the parents' own interest in taking vocational-education courses.

From a reading of the reports and talks with some of the people involved, I gather that the material on student needs and interests constitutes the primary basis for findings concerning the need to expand vocational-education facilities. These findings may then be modified to bring them in line with the views of key employers, vocational educators, and other persons in the community.

To the extent that they figure at all, statistical projections of manpower requirements serve as check points to confirm conclusions already reached or to play up some areas of occupational emphasis in the proposed program and play down others.

Perhaps, the lack of quality projections for local areas has something to do with the fact that projections are not used more in planning facilities. But it seems clear that the studies have placed primary weight on estimates of the number of students and on students' preferences and have done so because these are directly translatable into estimates of needs for facilities. Translating manpower requirements into facilities is a much more involved matter, among other reasons because it means taking other sources of supply, such as industry training and upgrading, into consideration in reaching a decision about the number of students to be trained.

As far as the check-point function of projections is concerned, it is important for us to realize that Statewide and national projections, as well as projections for the specific local area, are relevant to local determinations of educational needs. The fact that little or no need for electronic technicians is seen in an area should not rule out electronics training if State and national projections show electronics occupations due for substantial expansion.

If I may presume to speak for them, vocational educators consider that their primary responsibility is to meet needs as expressed by their students and the students' parents, but to meet them in a way that is oriented to trends in job opportunities either in the area where the students live or in areas to which they can be expected to move to obtain jobs.

This manpower orientation is an especially important supplement in view of the fact that student views about job opportunities are likely to be uninformed.

Projections of occupational requirements are used by the guidance and counseling officials of high schools, of employment offices, and of other agencies that have job-placement and job-advisory functions. These officials constitute a bridge between the lack of accurate information among young people about job opportunities and the more or less solid ground of what is known about prospects--both short-range and long-range prospects--on the basis of job projections and judgments derived from nonquantitative information. BLS occupational outlook publications have been the main source of data to fill this gap.

Ideally, for guidance purposes, projections should be available for both the local area and for broader areas--regional, State and national. The guidance perspective should not be restricted to the immediate locality.

Actually, as we all know, comparatively few local areas are blessed with good projections, and prospects are not especially bright that many will have good projections in the foreseeable future.

We in the New York State Department of Labor have just completed 10-year projections of manpower needs for technicians and technical specialists for major labor areas in the State, as well as for the State as a whole. We included replacement as well as expansion needs, and data on how many jobs could be expected to be filled by upgrading, assuming a continuation of past practice.

Estimating how many jobs there will be in the future in various occupational fields is only one of the functions of manpower research in helping to guide vocational and technical education planning. Another is to help in planning and evaluating the structure and content of the program and curriculum.

Among the kinds of relevant information the manpower researcher can supply are -

...Employers' education and experience requirements in the different occupations.

...Kinds and level of subject matter knowledge and technical skill that are utilized in performing the jobs.

...Kinds and level of schooling, job training, and job experience that have contributed most to developing skills utilized on current jobs (that is, education, training, and job histories of workers).

...The extent and character of manpower training carried on by employers, the frequency of upgrading, and employers' views concerning the respective roles of the schools and of industry in manpower training.

Our survey of technical manpower in New York State was designed to help answer some of these questions so far as technicians and technical specialists are concerned. The results of the survey have been presented in our forthcoming publication, Technical Manpower in New York State.

Similar studies are needed of the skilled crafts in relation to high school vocational-education programs, and apprenticeship training. We know from our own studies of the metal trades in New York State, and from Federal studies (such as the BLS studies of mobility among tool and die makers and certain other crafts, and especially, OMAT's noteworthy monograph no. 2, Formal Occupational Training of Adult Workers, 1965) that many persons become craftsmen without the benefit of either formal high-school vocational education or apprenticeship training. We also know that apprenticeship-training programs in many instances disregard and give no credit for related vocational course work received in high school.

In New York, we feel we should have a good deal more information than we do concerning the significant skill-development processes of education, training, and work experience in the skilled crafts. We expect to point some of our research in this direction.

Manpower Program for a State

Margaret Thal-Larsen, Executive Secretary
California Commission on Manpower,
Automation and Technology

I believe that if I fail to give you any background whatsoever, you will end up wondering why I am here. Why should I, the representative of the so-called "Automation Commission" be talking to you labor statisticians and administrators, about a manpower information program that is meant to serve as a basis for a manpower training program?

This would be a good question.

Also, if I give you no background, I think you will not have the perspective against which to judge this program, including the fact that it is the product of essentially a lay group, a group that is not a Bureau of Labor Statistics or an Employment Security agency, but a group of outsiders. This fact, I believe, gives the program much of its significance and its interest.

The Commission on Manpower, Automation and Technology was set up by act of the California legislature in June, 1963, and it has been operating actively since about March, 1964. There are certain aspects of this Commission that I believe predisposed it towards developing a manpower information program, although this never was at any time its specific goal.

One of these is the fact that this group of men tends to think of itself, I believe, as a means of communication in the economic sphere. I have heard them call themselves "insiders" and "outsiders," and the outsiders outnumber the insiders. The outsiders are the laymen. They are the appointees of the California Governor and the legislature. Three of them are public members and as you might guess, all three of these are college professors: of industrial engineering, of industrial relations, and of law.

Six of the men represent the leadership echelons of labor, all different types of unions from different parts of the state. Six represent large employers, one of them an agricultural employer, and eight are from the legislature; four from the Senate, four from the Assembly.

Now, we come to our "minority group," our "insiders." These are State agency chiefs from the Departments that are most concerned with manpower programs: the Department of Employment, of Industrial Relations, the Superintendent of Public Instruction and the heads of Agriculture, Social Welfare, and the Economic Development Agency.

So, as you can imagine, a group intensely interested in communicating, representing such diversified fields, would quite likely--and they did--stress the importance of an adequate information program.

Another feature that pushed them in this direction was the fact that when thirteen of these twenty-nine men wear their other hats they become California's Manpower Advisory Committee for purposes of M.D.T. and other training programs. In their search--and this has become more pointed in recent months than it was originally--for an over-all training policy for the State, they have come more and more to a realization that such a policy must rest upon an adequate manpower information program.

A third factor pushing the Commissioners in the direction that they have gone has been their manner of operation. I would be inclined to characterize this as one of interminable talk. They have conducted public hearings; they have held numerous meetings of the Commission itself and of its committees; they have sponsored technical institutes; they have worked with a large number of volunteer consultants. In the course of all of this talk, they have often asked, "What do you need for more effective operations," and the answer has almost always been, "More manpower information." So, it was inevitable that they should go down this path.

I have been talking about a "program." I have been using that word because it was the word I found on the agenda. Possibly, I should mention in what sense I am using this word. I mean by program a proposal or a recommendation because I am talking to you about a proposal that has been made to the Governor and the legislature of California. It is not a program that we have in effect at this moment. However, just to prove to you that it is impossible to say anything about the California Commission without getting into some kind of discussion, I should also mention that there are those who say there is nothing new about this proposal, and in a sense they are right.

You will recall that Mr. Goldstein complimented California by saying that a great deal of analytical work has been done there. In the sense that many persons like yourselves have already amassed an enormous body of manpower data in California, the Commission's proposal is not a new program. But, it is a new program in the sense that it is more comprehensive, more coordinated, and certainly more centralized than anything that we have at this time. Also, it has several new elements of input-output and of control and feedback--you can

tell that I have been associating with engineers as well as college professors--that we do not have in the State of California at the present time.

This brings me to the question: precisely how did this Commission that was charged by the legislature to appraise, continuously, the impact of automation on the labor force and to suggest adjustments, get into the manpower information business?

This rather cumbersome charge from the legislature has been expressed much more succinctly by certain prominent officials in California. They have said, "The task of the Commission is to solve automation," so I can answer the question very easily as to how they got into the business of manpower information. It was in their efforts, curiously enough, to solve automation.

It came about in this fashion: At a meeting of the Commission, one member decided that a very fine way to solve it would be to develop a system of education and training--and here I quote--"which would fit the California's labor force to the needs of the modern technological economy." To devise such a system is surely a task about as large as the original one of solving automation.

So the Research Committee was asked to submit a plan to the full Commission for developing a system of education and training that would do just exactly this, solve automation. The Research Committee was somewhat stupified by the magnitude of this instruction, but hopefully it called a meeting to start out on the task. It took the Research Committee no time at all to decide that this large order simply had to be broken down into smaller, bite-size pieces that would be manageable.

To this end, the Research Committee appointed some sub-committees, one of which was on vocational counseling, a subject in which the Commission has had a tremendous interest from the start. The Commissioners have regarded the vocational counseling system as our line of communication in the world of work. Counselors are the ones who must assist people to get the proper form of education for the jobs they can expect to find. So are these lines of communication properly staffed; are these people expert enough in the techniques of counseling?

While considering problems of this sort, someone asked the eminently sensible question, "Counseling for what," and this turned out to be indeed the key question, and we were back once more to where we had been in the very early days of the Commission, looking at job market information, this working capital, you might say, that the counselor needs.

Then there were still more meetings. Mr. Goldstein kindly came out and helped us with one that was held with the American Statistical Association. A demonstration project was launched with the California Department of Employment to learn what it would cost to expand the production of labor information along certain fronts.

At last, after all of this talk and this experimentation, one comparatively brief Commission recommendation emerged. What I want to discuss is this recommendation which has come from a lay group that is, in a lay fashion, talking about matters with which you have spent your working life in a professional capacity. For that reason, I think it will interest you to learn what a group of essentially outsiders thought should constitute an adequate state labor area information program.

At the outset, the Commission called on the legislature and the Governor to create a comprehensive and coordinated manpower information program. The emphasis on these two words is very strong, and I find that some of the Commissioners in alluding to the program tend to add a third word, "Continuous." Generally speaking, these men are more interested in setting up a structure of government that can attract and retain well-trained people and turn out this work on a continuous basis than they are in the production of any specific reports.

Next, the responsibility for a major part of this program is centralized under one man. One agency is directed, in cooperation with the Commission, to carry on this program, and this one man is the Administrator of Employment Relations which, in the State of California, means the man who reports to the Governor for both the Department of Employment and the Department of Industrial Relations. We do not have a labor department in California.

It is this man who is to have final responsibility for most of the components of a manpower information system. The first item of output that is stressed is labor projections, short-, medium-, and long-term projections on a coordinated basis for the State as a whole, for the standard metropolitan statistical areas in California, and where necessary the smaller communities. Mr. Pearce has talked to us quite a bit about projections. I can say on an empirical basis that in all of the hearings the Commission has held, it has had by actual count more requests for information on future labor needs than any other area.

Currently in California, we have no such projections by occupation for the State as a whole. Where projections by industry have been made--and some very fine ones have been made--they are now obsolete.

I would also like to say that the Commission did not spell out the methods it would like to see used in the making of occupational projections. This has been left wide open because a general belief exists that there should be much more exploration of various techniques. Depending on circumstances, an area skill survey might be the answer in one case. An occupational matrix applied against a judgment estimate of future employment in a given industry might be the answer in another. Or there may be cases where an input-output study is available to provide the estimates of future employment upon which occupational projections can be based.

In fact, the reason why we gave our institutes in cooperation with the American Statistical Association was not to drum up any additional enthusiasm

for the production of labor force or occupational projections, but rather to instill in some of the very articulate persons demanding information a greater respect for the technical difficulties of making such estimates.

The next item of output asked for in the Commission's program is an expansion of intensive studies about industry. This is a type of report that exists today in California and has a considerable usefulness just as it stands. It is believed that expanding the production of these reports would bring into the hopper more data that would be useful for occupational projections. There is also a requirement for a stepped up production of occupational guides.

When we asked the school district heads what they wanted by way of manpower information, they asked for about a four-fold increase in the production of occupational guides. They also wanted a great deal of additional information which could be used for the long range planning of curricula and facilities.

The next major category of data finding its place in this program is job vacancy data. You probably know that Los Angeles was the site of one of the pilot projects conducted on job vacancies. It is the Commission's hope that we will develop these data on a State-wide basis and for all of the State's major metropolitan areas.

One rather unusual item in the Commission's program is a continuing household sample survey. This, too, sprang out of our public hearings. The Commission has believed from its inception that we possess insufficient labor supply information. We do not know enough about total unemployment, particularly youth unemployment. We had no way of keeping up on the occupational changes in our employment. Further, the population forecasters tell us that they are greatly hamstrung by the fact that there is no source of data to show how California's population is changing in its socio-economic characteristics to aid them in making future population forecasts. Consequently, the Commission came up with a recommendation for a quarterly household sample survey in California, both for the State and local areas. We have just been informed that $350,000 is what an economic model of such a survey would cost.

The Commission's program also calls for a step-up of special labor force studies in order to determine what are the characteristics of our present labor supply, particularly among the disadvantaged groups, so we may have more data for special programs where these are needed.

The recommendations of the Commission also include what is called a manpower research program unit. This unit--brought under the direction, again, of the Administrator of Employment Relations--has been placed in California's Department of Industrial Relations. This agency, in California, has the C.E.S. contract. Thus it was believed to constitute the best channel for pioneering occupational research carried on by the B.L.S. at the national level and by the Department of Employment locally.

There are a few elements in the system proposed by the Commission which are not directly under the Administrator of Employment Relations. One of these

is conducting industry manpower conferences. A great deal has been said today about getting employment information from employers; a great deal has been said before the Commission, and that body has come to certain conclusions. One is that employers are not as reluctant to give this information as has been frequently alleged. So far as their ability to give accurate information is concerned, there can be some doubt however. This doubt is no reason for failing to go to employers to learn as much as they can tell us. The word "conferences" can mean "conferences" in one instance and "consultations" in another, whichever is the best method for a particular situation. In any case, the proposal is to resort to the representatives of the employers to learn their views on future developments in their industries. Determining the proper approach has been left to the Economic Development Agency because of its particular prestige with employers.

One matter that may emerge from these conferences is that it is much easier to get from an employer an estimate of his future production whether it be in terms of so many feet of plywood or so many passenger miles than it is to learn the occupational composition of the future workforce producing these units. The problem is a matter of translating units of production into people. This is the area where the employer is deficient and the one where such agencies as our schools demand information.

Employers need--and it may be that this responsibility falls on government where the need is greatest--to develop a new breed of expert who can take what we may be able to get from the employer as to future production levels and turn this into occupational projections. We don't know, but we have asked for studies that may furnish needed insights as to future occupational patterns at given levels of technology. Some interesting work of this type is being done in California at the present time.

Studies on technological change have been assigned to the Administrator of Employment Relations, but it is quite possible that his responsibility should be only to see that studies are carried on in State universities or that those prepared at the Federal level are utilized.

Another element in the Commission's program is the holding of annual statistical resources and requirements conferences. This is an effort to get the users of the data into contact with the producers of such data. For this, the Department of Finance was made responsible. On June 25th, we will have our first complete report from California's Superintendent of Public Instruction.

In conclusion, I would like to say that the total output of this system I have been talking about forms the crux of what the California Commission feels is necessary for training and education. In fact, the Commission would say this output is necessary not only for training and education, but also for the efficient administration of an employment service, for the knowledgeable conduct of labor-management relations, and for all the other adjustments to technological change that we have been told must be made.

Research Under the Manpower Development and Training Act to Improve and Extend Manpower Information

Seymour Brandwein, Deputy Assistant Director
Manpower and Automation Research
Office of Manpower, Automation and Training
U.S. Department of Labor

David Bushnell and I have just come from a two-day session at the University of Wisconsin on manpower information needs for educational planning. I want to touch on just three things. One is to note a new aspect of the OMAT research program. Two is to tell you about the debate at the Wisconsin meeting from which I have just come, since it is significant for all of us. Three, I want to offer a reminder that the information needed is hardly of a statistical nature alone.

The Department of Labor has an appropriation administered by OMAT to supplement and go beyond the BLS and BES manpower research activities; these funds are used largely to tap and stimulate academic and other research resources outside the Labor Department, including possibly State agencies.

I want to cite one new development, however, which bears on shortages in our own field--the shortage of good manpower researchers and the shortage of competent people in related fields: psychologists, sociologists, those who devote attention to manpower problems. Under this year's amendments to the Manpower Act, we will be getting some funds to use for small research grants to attract and support promising graduate students to train them for work in manpower research; we are looking ahead to strengthening our relationships in this respect with universities. Hopefully, we will be able to provide grants for perhaps three or four dozen persons a year initially, and thereby start building an enlarged pool of persons with some ability, preparation, and interest to draw on for manpower research.

Now as to the conference in Wisconsin, it brought together a couple of dozen top-flight academic economists, several educators and a number of manpower experts to consider what sorts of occupational information are needed to help plan for training and education for work. Remarkably, about half of those at the meeting took the position that we already have about as much data as we need, that particularly on occupational projections it would be a waste of time and money to do any more, and that anyone interested in training and education should worry about problems other than projection information--which they would not know how to use anyway.

I have over-simplified this, of course, but it is a fair description of their reaction, at least in the early part of the conference. I am speaking about the academic economists and they, mind you, are able, technical, analytical men who are not frightened by statistics and whom you would expect to be prime supporters of efforts to improve and enlarge manpower information.

As they expressed skepticism about occupational data and projections, several things became clear, which should offer some guide to us. One is that they really did not understand what was available, how it was developed, how it was used, and how it could be used. They did not understand because they had not really worked with the data; time and again they would say, "We do not know anything about this area," but then launch into strong criticism. They had some misconceptions, and for this I am afraid, the producers of the data may be as much to blame as the critics are, because the data quite often are presented cold with only limited interpretation or guides as to their usefulness and recognized limitations.

Secondly, they were so worried about the misuse of projections that they were unwilling to consider their good use. They may have a point here.

Thirdly, there were assorted comments about needing less statistics and more facts. The point that there are a lot of competitive, overlapping and non-comparable data which only a technician or analyst could rationalize could be a point to consider.

Also--and this is critical--they felt the use for which the data was intended was not given enough attention, that is if the data are to be used for planning, the data developers must be more specific about planning for what, for whom and by whom, and for what time span, and so on, since different objectives and different settings require quite different types of information. It is beyond dispute that they have a good point here too.

It is easy to get annoyed at these reactions and attempt to make some sophisticated reply, "but you do not understand,"--and we did--however, there is more to it than that. I will not go into detail but on the plane flying here I tried to crystallize some of the implications for us.

The central one--it is hardly new, but it is critical--has been emphasized by Mr. Pearce and Mrs. Thal-Larsen, that too many of us, in devoting our attention to the collection and reproduction of data, are not doing as much as we should on dissemination, on interpretation for policy and program needs, on getting the information used where it should be used. This means more than putting a bright cover on top and it means more than enlarging the mailing list.

Mind you, I am not opening now the question of whether we are gathering data that is needed or necessary or whether what is available is as reliable as we would like.

It is clear to me that the pace at which we proceed to the enlarged and improved programs discussed at this Conference will be shaped significantly by how well and by how much better we do the following: One is how well we pull together, synthesize, or--if you will--digest the information which the non-technician too often sees as scattered miscellany. Two is how well we distribute and advertise our research.

I think some of that task may be beyond us but it does present a challenge in trying to identify and to present differently to various people the types of data relevant for different objectives, rather than relying as heavily as many of us do on the time-honored tradition that "we get the data and it is up to others to figure out how to use it."

It means we have to do more to translate and interpret the information, to explain how it can or should be used and how it should not be used. Of course, all these directions for needed action mean that labor statisticians really have to do more homework on things other than statistics. It means learning more about other institutions, how they operate and what problems confront them.

Now, since my topic on the program is "Needs in Adult Training," I will close with a brief illustration of the too-often overlooked fact that training for employment often requires many types of manpower information other than employment, unemployment, and occupational data. This is true particularly in efforts to train some of the most disadvantaged, under-educated groups for whom cultural and other problems beyond lack of skill bar the way to reasonable and regular employment.

For this, I will simply list some of the distinctive needs and information-seeking objectives set forth by just one of the special demonstration training projects financed by OMAT. This particular project is being conducted by an organization called Action for Appalachian Youth and its efforts focus on rural young people in the West Virginia mountain areas. The first question is how to get such youngsters to respond to training opportunities. The project will try to visit and counsel with them in their native "hollows" rather than merely issue a general call for interested youth to come to some central location.

A second question is how to determine potential for training. Since this is a relatively uneducated group it is necessary to use non-verbal tests to determine aptitudes and capacities, so the project will use job tasks as a measure of capability.

A third problem is that most of these youngsters need a great deal of preparation even before they can be started on any sort of skill training, and the project plans to provide literacy and other types of basic and disciplinary skills required before specific occupational training can be absorbed effectively. Also, since many of these youngsters have found it difficult to function in a traditional school setting, the project will try to provide the training in a work setting.

Finally, assuming these youths can be reached and can have occupational skills developed, can they effectively move into and hold on to a job? The prospects are dubious because there are other obstacles, so the project will try to prepare them for an urban setting by providing the training and a period of adjustment at a residential center. Since adjustment to urban life will often present other problems which may bar their way to continuing employment, the project will also experiment with a period of follow-up counseling after the youth gets placed in a job.

We could cite many other training problems confronting particular disadvantaged groups. Various experimental and demonstration projects are seeking information and insight on how to identify and best meet these problems. This concern should be part of the province of labor statisticians and not alone a responsibility left to other social scientists. I look forward to increased participation of labor statisticians in the measurement and solution of these problems.

Research Needs in Education

David S. Bushnell, Director
Occupational Research and Planning
Office of Education
Department of Health, Education and Welfare

When Harold Goldstein and Commissioner Clague invited me to talk on the occupational information needs of education, I was very pleased because I knew this conference followed immediately on the heels of the conference held at the University of Wisconsin on the same subject, and I could borrow from that some of the ideas offered to us. We were co-sponsors of the conference, and I think Seymour mentioned that the answers were few and the questions were many, so what I brought with me are questions.

I am going to tell you just two things, leave two messages with you that are relatively simple. The first is to describe briefly a new research program which has been established in the Office of Education. As I do that, those of you who are not interested in doing research or perhaps getting money for research can just rest your ears until I get to the second topic. The second topic will be to talk about some of the research needs that we do have in the Office of Education on which you perhaps can give us some help.

Just last fall, Congress in its wisdom, saw fit to institute a research program under the new Vocational Education Act of 1963. They earmarked ten percent of the vocational education appropriations for research, an amount in excess of $50 million through the fiscal year 1967. This portion of the annual appropriation for Federal support to vocational education will be used by the Commissioner of Education for grants to colleges, State departments, public or non-profit private research agencies and, with State board approval, to local education institutions. Further, each State is required to allocate at least three percent of its annual Federal allotment for activities and services designed to improve its vocational education program. Such ancillary activities include research and development. From the scope of this effort, it can be seen that research and development will have a major part to play in adapting vocational education and occupational preparation to the dynamic pattern of our economy.

The ability of our public school system to adapt to national and local needs has been studied carefully by many task forces and associations in the past decade. The question of how to prepare youth and adults for continuing

employment has been the subject of attention by twenty-five Federal agencies. The relationships between these agencies and State and local authorities is a subject worthy of study itself.

What are effective vocational guidance and counseling procedures, and what techniques and materials need to be developed for the non-academically bound youngster? These are but a few of the questions to be attacked with the support of the Occupational Research and Planning program (ORP).

In staffing and implementing our program we hope to attract research personnel from each of the major disciplines--psychology, sociology, economics, anthropology--to devote their best research resources to the planning needs in vocational education. Three Review Panels, composed of leaders in these related disciplines, have been established to review and recommend action on all proposals submitted for funding. ORP intends to offer the following services to the research community:

1. Stimulation and implementation of research and development projects through contractual arrangements with appropriate institutions.

2. Consultation in the preparation of research proposals, with special emphasis on assistance to institutions, school districts, and community colleges not experienced in the planning and writing of proposals.

3. Sponsorship of seminars, conferences, workshops, and institutes for present and prospective vocational education personnel, with attention to the development of educational research talent.

4. Assistance in the expansion of State and regional research and development capabilities.

5. Dissemination of research and development results in effective and understandable ways, augmented by the establishment of several centers to serve as clearing-houses of information in the area of occupational education.

In addition to these functions, the staff is in the process of implementing a small grants program aimed at developing promising ideas, supporting feasibility studies and library research, or planning of larger research programs.

Training proposals concerned with the updating and upgrading of vocational educators and administrative personnel will not be subject to panel review and can be negotiated more rapidly. Experimental, pilot and demonstration programs should serve to support innovative and applied efforts which warrant dissemination to other institutions faced with similar problems. Each application falling into this category should make adequate provision for careful evaluation of the proposed projects.

Let's take a look now at the types of proposals received and projects soon to be funded under this new research authority. During our first six months of

operation, we have received more than 500 proposals. Most have come from colleges and universities, but there are a few from local school districts, State offices, and non-profit organizations. In general, these proposals can be classified in one of three major categories:

1. The identification of current and future employment opportunities and related skill needs. Such studies propose to examine the range and type of employment opportunities available in our economy. Assessment of the competencies individuals need to enter into and progress in such opportunities are also being proposed. New methods for conducting regional job surveys, the identification of skill clusters associated with a variety of occupations, and the development of counseling and guidance data appropriate to the local level illustrate other types of applications.

2. The development of human resources. Many researchers will focus on the individual needs of students, improved ways of teaching culturally-deprived youngsters, developing aptitudes and cognitive skills, motivating students to pursue appropriate courses and careers at relevant age levels. Some have sought to conduct studies on how to provide youngsters from deprived backgrounds with the opportunity to develop their reading, writing and reasoning skills before they become overwhelmed by secondary and post-secondary school programs.

3. The development of educational resources and training programs. A large number of investigators are exploring these problems. We expect to spend a considerable amount of money this year on improving vocational education curricula, on developing new patterns of organization for vocational and technical schools, and on devising appropriate roles for community and junior colleges to play in post-secondary and continuing or adult education programs. A number of pilot and demonstration programs currently underway at State and local levels will be evaluated and written up for circulation to other appropriate institutions. Improved guidance and counseling procedures, greater use of new instructional technology, improved instructional materials, teacher training, design and development of residential schools are all projects which fall into this category.

Please recognize that this program has been in existence for only six months, and it would be foolhardy indeed if we thought that we had successfully identified all of the problems associated with our field of interest. We hope to screen selectively and fund those studies which will contribute to the achievement of the objectives specified under the new law. It is our earnest desire to encourage all institutions, who have something to contribute to an effective research program, to submit their ideas for our consideration. Through your cooperation, research and development in the preparation of youth and adults for gainful employment will help to shore up the nation's economy, just as research and development in industry has helped to insure the continued viability of the modern industrial enterprise.

Chairman Johnson: There is one question I would like to ask of Mr. Russell. Have we come anywhere near the problems that you suggested in your letter?

Mr. Wendell H. Russell: Yes, I believe we did. I am very glad that I attended this Conference. I have already made contact with many people from the fifteen southern States that we are surveying this summer and if there are those with whom I have not yet talked, I will be glad to see them. I will be around for the rest of the Conference.

Chairman Johnson: Do we have any questions?

Mr. Brandwein: I thought it might be useful to pose for Dave Bushnell a question which we brought up recently in Washington. In identifying the financing of studies, I know that you had some specific things in mind; but it would be useful to sketch out where the dividing lines come in terms of where you can allocate your funds, as against where the Labor Department should be allocating ours so that we don't develop waste.

Mr. Bushnell: It is a difficult question because there are some gray areas.

I think we would be principally concerned with what kind of skill needs we ought to be identifying and relating training to. This means that we would like to get from three- to four-year advance projections at the local level which would relate the vocational training then to the local manpower requirements.

I do think that with the Department of Labor--and I know we talked about O M.A.T. working on better models for projecting job opportunities, and the B.L.S. is doing some of this also--there ought to be a viable connection between the vocational education people and the State Department of Labor people and the Employment Security people so there is better integration of this information with their planning for vocational education.

Mr. John W. Lehman: Another question that comes to my mind relates to the need to translate information for its use by the policy person; also, in regard to the technician, when are we going to start to form relationships with the pursuers of the data in order to give them the reasons they need to provide these translations because that, too, requires reasons, and it seems to me this is a key point we have missed over the years. What can we do about this?

Mr. Brandwein: I think you are right, and I should make it clear that although the resources which have been appropriated for O.M.A.T. to use in supporting research are not yet of the magnitude which Dave Bushnell is struggling with, we have deferred some of them.

Mr. Bushnell: We haven't had any trouble. Let me say that we have deferred some of these funds to support the fields of activity which I think would encourage experimentation. There is no question if you do not do this effectively that one time in three you are going to put your foot in your mouth, and even if you do an effective job, you are going to find yourself in the middle of some scalding hot water, but the contribution is something that will be worthwhile.

Any time you are ready to try a new tack with some of the data and you need to have help, we will consider the possibility of financial support for it.

The Last Five Years: Economic Expansion
and Persisting Unemployment

Chairman: Ewan Clague, Commissioner
Bureau of Labor Statistics
U.S. Department of Labor

Robert A. Gordon, Professor
Department of Economics
University of California

MR. EWAN CLAGUE: In 1961, there was an article in the Reader's Digest which summarized their views on the subject of unemployment and employment in the United States, and it ended up with the assertion that the figures were being juggled in order to get more budget for the Bureau itself and other parts of the Department of Labor. Furthermore, the article suggested repudiating the BLS and the statistics associated with it.

It was this situation that prompted President Kennedy, at the suggestion of Secretary Goldberg, to appoint a special expert committee to review employment statistics. I might say, by the way, that one of the problems we faced at that time was that the Reader's Digest never prints any letters from its readers, so even Secretary Goldberg couldn't write a letter to the editor, commenting on this article. I tried in my way, and I couldn't either, so in some respects the situation was serious enough that the President felt it was essential to do something to meet this basic challenge to our facts as well as the insinuations in the article.

A committee of six members was appointed to appraise employment and unemployment statistics. That committee was headed by our speaker this morning, Professor Robert A. Gordon of the University of California. He assembled his committee; they came down to Washington and worked for a period of a year--not he himself, but working with staff assigned to work with the Committee--reviewing our statistics, and those of the Bureau of Employment Security.

The Committee published a report which at that time and still today represents substantially the last word on employment and unemployment statistics. The Committee completely exonerated the BLS from any charge of juggling figures in its published report.

The Secretary of Labor accepted these findings, and since that time, the various departments have been trying to put the recommendations into effect. We haven't gone as far as we would like, but some things have been achieved.

We have had the good fortune to be able to capture Professor Gordon on his way back from a conference where he spoke on this general subject, and for that reason we are able to have him here this morning. This conference took place earlier this week, overlapping our own, so we asked Professor Gordon if he would be willing to give us a talk on the general subject of economic expansion and what interpretation of this we can offer to the public.

I give you now Professor Gordon.

PROFESSOR ROBERT A. GORDON: Thank you very much, Ewan.

At some time during his life, one begins to look back at his career and pick out some crucial point in it. In the field which is certainly one of the most technical ones in the aspects of labor statistics, I was a babe in the woods that day in late 1961 when a call came in from the White House. I tried to consider why this happened during the 3,000-mile trip to Washington, and it was obvious that it was not because of any expertise or competence on my part but the fact that a few of my good friends in Washington who were there then decided to get even with me for some imagined wrong. Suddenly, I became an expert to deal with manpower and employment statistics.

With your permission, I am not going to talk this morning about manpower statistics directly. Rather, I am going to talk about what has been happening during the last 4½ years, which constitute perhaps the most remarkable period of cyclical upswing and expansion this country has ever experienced; and we still have an unemployment rate above 4½ percent.

Although output has been expanding for more than 4 years, and the preceding recession was both brief and mild, unemployment has remained at an unsatisfactorily high level. The unemployment rate did not fall below 5 percent until November 1964, and it has remained in the range of 4.6 to 5.0 percent during the first 4 months of 1965.

The cyclical upswing has been unusually steady and moderate. While the rate of expansion compares favorably with that of past upswings, prices have been exceptionally stable; inventory accumulation has been kept at a minimum; profit margins have been maintained unusually well; few supply bottlenecks have developed; the supply of money and credit has continued to expand at an unusually steady rate; and, with perhaps a few exceptions, there has been little evidence of the sort of exaggerated short-term expectations that a prolonged boom usually engenders.

These features of the current upswing raise two questions. First, why have we not been able to achieve a closer approximation to full employment after 4 years of steady expansion? And, second, would an expansion rapid enough to have brought the unemployment rate down to 4 percent by now have been undesirable for other reasons, either because it would have brought about an unacceptable rise in prices, or because it would have set in motion forces that by now would have led to another recession?

This last question is not asked as often as it should be.

Let's gain some perspective on the present upswing by comparing the present business cycle with the several that preceded it. We have already noted that by past standards, the pace of advance in the current upswing has been relatively moderate. The rate of advance has been slower than during the 1949-53 or the 1958-60 upswing, although more rapid than in the 1954-57 expansion. However, the 1960-61 recession was one of the mildest on record,

whereas the total amount and rate of decline in the 1957-58 decline were among the most severe--actually the most severe--of the postwar recessions.

If we compare average rates of change in gross national product (GNP) between cyclical peaks, thus combining each cyclical expansion with the preceding recession, we find that the most recent period from the peak in 1960 through the first quarter of 1965 gives a very good account of itself. The average annual rate of growth in GNP since the 1960 cyclical peak has been 4 percent, much more than during the interpeak intervals 1953-57 or 1957-60, although still considerably less than during 1948-53.

Let us examine the changing patterns of growth and the major components of what we call "aggregate demand"--consumer expenditure, private investment, and government expenditure, both Federal and State and local, on goods and services. When we do this, the retardation in growth which occurred between 1953 and 1960 stands out, as does the acceleration in growth that has occurred in the last 4 years. The reasons for the retardation in 1953-57 were different from those that explain the slow growth between 1957 and 1960, and this contrast is of considerable significance in understanding the reasons for the high level of unemployment that came after 1957.

The period 1953-57--what we loosely call the "boom of the Fifties"--was actually a period of retarded growth which culminated in the investment boom and inflationary price rise of 1955-57. The drag on the economy during these years came entirely from the Federal Government, whose expenditures on goods and services declined sharply between 1953 and 1957. The rate of growth in private investment during this period was moderate, about 3.1 percent per year, but the increase in investment between 1953 and 1955, the first part of this boom period, was at the rate of no less than 6 percent per year, and gross capital formation then remained virtually constant at this high level through 1956 and 1957.

This horizontal movement during the prolonged investment boom of 1955-57 brings down the average rate of increase for the entire period 1953-57, and the moderate average rate of increase for the entire 4-year period does not fully reflect the magnitude of the investment boom that occurred during the mid-1950's.

The effect of the decline in government expenditures during this period was to hold back the expansion of total output, and the unemployment rate rose from 2.9 percent in 1953 to 4.3 percent in 1957. Paradoxically, wholesale prices were relatively stable in 1953, a year presumably of full employment, but rose sharply in 1956-57, when unemployment was above 4 percent.

Then came the end of the investment boom and the sharp business contraction of 1957-58. Recovery from this recession was sluggish. The explanation for this sluggishness clearly lies in the combined behavior of Federal spending on the one hand and private nonresidential investment on the other. Although total output continued to grow at a modest pace between 1957 and 1960, both nonresidential construction and expenditures on producer's durable goods showed net declines between 1957 and 1960.

The Federal Government sharply decelerated the rate of decline in its expenditures after 1957, but there was still some further net decrease in Federal Government spending on goods and services between 1957 and 1960. The one type of nonconsumption expenditure that showed marked acceleration and growth between 1957 and 1960 was residential building. The average rate of increase in this type of investment jumped from 3 percent during 1953-57 to 6 percent during 1957-60.

But even with this housing boom, the average rate of increase in total gross private domestic investment amounted to only 1.2 percent a year. If we take out inventory change, the rate of increase in private investment was only four-tenths of a percent a year. With total government expenditures rising at a rate of less than 2 percent a year, it is not surprising that the growth in total output averaged only 2½ percent between 1957 and 1960, somewhere between 1 and 1½ percentage points less than the rate needed to maintain full employment--and you know the result. The unemployment rate rose from 4.3 percent in 1957 to 5.6 percent in 1960.

I don't think it is putting matters too strongly to say that what the American economy had to recover from when expansion began again in 1961 was not the mild recession in 1960-61, but the relative stagnation of the late 1950's, particularly in the period 1957-60. This stagnation was associated with an absolute decline in private nonresidential investment that the Federal Government made no attempt to offset either through increased spending or a cut in taxes.

As has been increasingly recognized in the last few years, the tax reduction that was eventually made in 1964 should have been made in 1958.

Now, I will return in a few minutes to talk further about stagnation in private investment after 1957, but I should like now to take a further look at the current upswing. As we have already seen, the net rate of growth in real GNP since the 1960 peak has been much higher than during the two preceding peak-to-peak periods. Indeed, the growth rate of 4.1 percent achieved during 1960-64 is one on which we would ordinarily congratulate ourselves. It has, however, had only a modest effect in bringing down the unemployment rate, in terms of annual averages from 5.6 percent in 1960 to 5.2 percent in 1964. Then the accelerated expansion in the first 3 months in 1965 brought the seasonally adjusted quarterly average to below 5 percent for the first time since the last quarter of 1957.

Accelerated growth since 1960 has been stimulated particularly by the marked and widespread revival in private capital formation. The 1960-64 rate of increase in gross private domestic investment, both inclusive and exclusive of inventory change, has been by a considerable margin the largest of any peak-to-peak period since the revival of private investment immediately following the end of the war.

The marked change in the trend in Federal expenditures is also to be noted. For the first time since 1963, Federal spending ceased to be a net deflationary force during the interpeak intervals that I am examining. The acceleration here

considerably more than offset the modest retardation in the rate of growth in State and local government expenditures.

So far, I have been leaving out the consumer, who had a very important tole to play, but I shall save a discussion of his role until a little later.

We have been tracing the changing rate of expansion in total demand during the postwar period. It is now time to take a look at the supply side of the picture, where we get into some of the manpower aspects of the problem a little more closely.

We can do this most conveniently by examining the course of what has come to be called potential output or potential GNP at full employment. Now, what potential GNP would be at full employment boils down to assessing the combined effect of the growth in the labor force and the net increase in labor productivity that have been going on, and this latter--growth in labor productivity--is particularly difficult to measure, as you know, and represents the net effect of a variety of forces: Growth of capital stock, change in the composition of capital stock, shifts in the industrial and occupational pattern of employment, changes in the intensity with which factors of production are being used, net changes in the quality of the labor force, primarily through education and training, and a residual set of influences that are loosely referred to as the course of technological change.

Under Walter Heller, the Council of Economic Advisors from 1961 through 1964 continued to estimate that the potential output at full employment was growing at the rate of 3½ percent a year. This 3½ percent figure represented roughly a 1 percent rate of growth in the labor force and a net increase in labor productivity of 2½ percent. Some economists have been urging that this estimate was too low, even for the period before 1964, and that it is considerably too low for the rest of the 1960's.

There is some evidence that the upward trend in productivity in the early 1960's has been higher, than the Council has estimated, and since the early 1960's, a sharp acceleration in the growth of the labor force has been under way. This acceleration in the rate of growth of potential output is recognized, albeit somewhat belatedly, in the January 1965, Economic Report of the President. In this Report, the Council offers the following statement:

In its past three Annual Reports, the growth of potential GNP since mid-1955 has been approximated by a trend line rising at a rate of 3½ percent a year. It now appears that the growth of potential has recently stepped up: A real growth rate of actual GNP somewhat greater than 3½ percent has been required to prevent a rise in the unemployment rate. 13/

13/ Economic Report of the President, January 1965, p. 81

The Report goes on to state that "The best estimate of recent potential growth must be placed somewhat above $3\frac{1}{2}$ percent and below 4 percent." 14/

It then proceeds to portray "growth rate of potential GNP at $3\frac{1}{2}$ percent from 1955 through 1962 and 3 3/4 percent thereafter." 15/

Having made this concession and recognizing the sharp acceleration in the rate of growth in the labor force that is now occurring, the Council then goes further:

> The prospects for growth of the labor force and productivity suggest that the increase of potential GNP in 1965-70 will exceed the $3\frac{1}{2}$ percent annual rate of the 1955-62 period and even the 3 3/4 percent rate estimated currently. Indeed, over the next 5 years it is likely to average about 4 percent a year, a rate approaching that of the early postwar period. 16/

The Secretary of Labor in his latest Manpower Report of the President goes further:

> If we assume no more than a continuation of the long-term productivity trend, and no significant changes in the workweek or the work year, the combined requirements for additional real gross national product...imply the need for an average annual increase well above 4 percent between now and 1970. 17/

> Taking into consideration the need to create jobs to reduce the unemployment rate from the current level of 5 percent to a more acceptable level, it will be necessary to sustain an annual average rate of increase in real GNP about equal to this year's high rate of growth for the next half dozen years. 18/

This implies the need for a growth rate of about $4\frac{1}{2}$ percent a year for the rest of the 1960's with no letdown at all.

Let us accept for the moment the Council's estimate that potential GNP in 1964 was about $27 billion higher than the GNP actually achieved. That is, to have had a 4 percent unemployment rate, GNP would have had to been about $27 billion higher than it actually was.

14/ Ibid.

16/ Ibid., p. 92.

17/ Manpower Report of the President, March 1965, p. 47.

18/ Ibid.

This is the level of GNP that would have been required to bring the unemployment rate in 1964 down to 4 percent. For this level of GNP to have been achieved by 1964, starting from the actual level of output in 1961, we would have needed an annual rate of increase in GNP between 1961 and 1964 of better than 6 percent a year and an annual rate of growth since the cyclical peak year of 1960 of about 5.1 percent.

This would not have been an unprecedented performance. The economy expanded this rapidly from 1949 to 1953, but it took the stimulus of the Korean War to do it. Various European countries have been able in the postwar period to maintain such high rates of growth for a considerable period without being interrupted by a serious recession. But I have doubts that the American economy could have maintained such a rate of expansion during 1961-64 without, by last year, running into some combination of the following difficulties:

Prices certainly would have risen faster than they did during the last year and a half. In the absence of earlier and stronger measures to curb the outflow of capital than were in fact taken in 1964, the balance of payments situation would have been worse than it was. Such balance of payments deterioration combined with the speed of the expansion, rising prices, and the approach to full employment almost certainly would have led to the Federal Reserve authorities adopting a moderately tight monetary policy in 1964, and very probably the rapidity of the expansion and the faster rise in prices would have generated considerably more inventory accumulation and led to other stresses and strains that in the past have typically developed in the late stages of a prolonged growth.

As a result, I think it is likely that had we achieved a 4 percent unemployment rate by 1964, a cyclical contraction would today be much more imminent than seems to be in fact the case.

To achieve an average unemployment rate of 4 percent, say, in 1967, the rise in real GNP between 1964 and 1967 will have to be at an average annual rate of virtually 5½ percent, considerably higher than the rate achieved during 1961-64. To achieve this goal, not only must the recent rate of expansion in aggregate output be accelerated, but of course, we must avoid a recession for another 3 years. Even with the new sophistication now being shown in Washington in the use of fiscal and monetary policy, one does not have to be much of a pessimist to express some doubt that unemployment can in fact be brought down to 4 percent by 1967.

And, as for Senator Clark's goal of 3 percent by 1968, more than mild skepticism would regretfully seem to be in order. This is apart from the structural problems involved in achieving and maintaining an unemployment rate as low as 3 percent in the United States.

Let me turn now to examine in greater detail the behavior of each of the main components of aggregate demand that I have mentioned. Let us begin with private investment.

I have already commented on the stagnation in private investment that occurred after 1957. Until 1962, total fixed investment in constant prices remained below the peak reached in 1956. Thus, we went through a 5-year period with no net expansion at all in private capital formation. In the absence of more aggressive action by the Federal Government, it is no wonder that growth was slow and unemployment rose.

Let us look particularly at the period 1956-60, the interval between two successive cyclical peaks in gross capital formation. Including change in inventories, gross investment in constant prices showed a small net decline. Excluding inventory change, total fixed investment was virtually the same in 1956 and 1960. The record would have been much worse except for a $2 billion rise in residential building and a significant increase in private nonprofit institutional investment.

Plant and equipment expenditures by business showed a net decline of nearly $3 billion between 1956 and 1960. In real terms, plant and equipment expenditures remained significantly below the peak reached during 1956-57 until last year, and even after the leap in expenditures in plant and equipment between 1963 and 1964, the net increase in plant and equipment expenditures between 1956 and 1964, an 8-year period, averages out at an annual rate of not quite 1 percent a year.

Given this behavior of private business investment, it is hardly surprising that aggregate demand has not risen rapidly enough since 1956-57 to keep the unemployment rate down to 4 percent.

As I see it, at least three sets of forces were at work by the mid-1950's to bring about a marked retardation and even absolute decline in private business investment. First, there were underlying forces at work to reduce the overall marginal capital output ratio and, therefore, the ratio of gross investment to GNP at any given rate of growth in total output.

Second, the investment boom of 1955-57 rested in part on the satisfaction of pent-up demands: the constriction of capacity to meet the pent-up demands for consumer durables, and more generally, accumulated demands for expansion and modernization of capacity, which had been held back by the Korean War.

Third, expectations were too optimistic in 1955-57. Investment in some lines generated a larger capital stock than was warranted, given the level and underlying trend in demand, and as a result, considerable excess capacity resulted. The capacity utilization rates achieved in manufacturing in 1955 and 1956 have not been matched since, even in 1964. According to the latest McGraw-Hill survey, the rate of operation in manufacturing in December 1964 was still below the preferred rate, although considerably closer to this preferred rate than a year earlier.

The expansion in plant and equipment expenditures accelerated markedly in 1964. In terms of 1954 prices, the rate of increase in such expenditures between 1963 and 1964 was a bit above 12 percent, and for manufacturing alone, the increase between 1963 and 1964 was about 16 percent. A comparable rate of

increase now seems very likely for 1965, with a larger fraction than in recent years going for capacity expansion rather than replacement and modernization.

Similar acceleration, however, is not evident in the other types of fixed investment, which add up to about half of gross capital formation, exclusive of inventory investment. Indeed, this other half of fixed investment, of which residential building alone constitutes two-thirds, showed little change between 1963 and 1964. As a result, total fixed investment rose by 6.3 percent in 1964, or only about half the rate of increase in plant and equipment alone.

This is still quite a respectable figure. Along with the tax cut, it helped to generate a 4.7 percent increase in GNP between 1963 and 1964. As we have seen, however, it appears that even this rate of increase in GNP would hardly be enough to bring the unemployment rate down to 4 percent in the next 2 or 3 years.

The probability that a rate of expansion in total fixed investment of better than 6 percent can be maintained for many years strikes me as being rather low, even with good economic management in Washington. The outlook for much expansion in residential building in the next few years is not promising, and this increases the need for very rapid expansion in plant and equipment expenditures, conceivably at a rate that may not be sustainable for very long. But, this remains to be seen.

I have already referred to the shifting trend in Federal Government spending during the postwar period, and, indeed, it is not unfair to say that at least until recently the Federal Government has been one of the major sources of instability in the American economy. In real terms, Federal Government expenditures on goods and services expanded rapidly between 1960 and 1962, rose very little in 1963, and showed a modest net decline in 1964. Thus, on the side of expenditures on goods and services, the Federal Government has been a drag on the economy during the last 2 years.

This has come about, of course, through a moderate cutback in defense expenditures, which in 1964 still accounted for more than 80 percent of total Federal spending on goods and services. State and local government expenditures, however, increased more rapidly during the last 2 years than between 1960 and 1962, although the average rate of increase over the 4 years, 1960 to 1964, was noticeably lower than during the preceding decade or more.

To evaluate the Federal Government's total effect on aggregate demand, we must look at more than just its direct expenditures on goods and services. We must take into account not only the behavior of tax receipts, but also the rapid expansion of transfer payments and their effect on private income and spending.

In current prices, GNP rose at an average rate of 5.1 percent between 1960 and 1963, accelerating to 6.6 percent in 1964. The rate of increase in disposable income after taxes between 1960 and 1963, a figure of 4.8 percent, was slower than GNP. Between 1960 and 1963, personal disposable income after taxes was rising more slowly than GNP, suggesting that the net effect of leakages and transfer payments was to hold back moderately the rise in consumer incomes after taxes.

Then, as a result of the tax cut, this relationship was reversed in 1964, even though the rise in GNP accelerated. In current prices, GNP rose by 6.6 percent between 1963 and 1964, but the rise in disposable income was significantly larger--7.3 percent. This change to a more rapid rise in personal disposable income than in GNP is entirely accounted for by the substantial reduction in personal income taxes resulting from the tax cut.

But we should not confine our attention only to the Federal income tax. As you know, Congress is well on its way toward a substantial reduction in Federal excise taxes. Sometimes, some of us are inclined to forget that State and local indirect taxes are far more important than those of the Federal Government, and they have been increasing faster than GNP; this continued to be the case in 1964.

A moderate acceleration in the rise of such tax revenues was another reason why personal income continued to grow less rapidly than GNP.

A further reason is to be found in the behavior of Government transfer payments, which also decelerated their rate of increase in 1964. The rise in Federal transfer payments to individuals in 1964 was only about 60 percent as large as the increase that took place in 1963. On the other hand, there continues to be a strikingly rapid increase in Federal grants in aid to State and local governments, permitting the latter to continue to increase both their expenditures on goods and services and State and local transfer payments.

Let us take a closer look at the 1964 tax cut. There is no question that this action had a strong expansionary effect on the economy. In the face of a continued rapid rise in personal income, the Federal Government collected 5.6 percent less in personal income taxes in 1964 than it did in 1963. If we take the five calendar quarters from the fourth quarter of 1963 through the first quarter of 1965, we find that disposable income increased at the striking rate of 7.2 percent per year. With a decline in the rate of personal saving during this five-quarter period, personal consumption expenditures expanded even more rapidly.

In other words, the tax cut obviously was a big shot in the arm to consumer spending.

Further fiscal stimulus is scheduled for 1965. First, there is a second and smaller installment in the reduction of income taxes enacted in 1964. In addition, a liberalization of social security benefits retroactive to the beginning of the year and a substantial reduction in excise taxes will very soon be passed by Congress. A substantial offset, however, will be the sizable increase in social security taxes beginning in January 1966. Medicare payments presumably will not begin until July 1966.

On balance, the net additional fiscal stimulus from these sources in the calendar year 1965 will be significantly less than that resulting from the tax reduction effective in 1964. Some moderate deflationary pressure will be exerted in the first half of 1966 on the side of the Federal Government, since

the rise in social security taxes will be considerably greater than the second reduction in excise taxes scheduled to become effective in January 1966.

Fiscal policy should probably be given a good deal of credit for the rapid expansion in private investment that has occurred during the current upswing. The new depreciation guidelines and the investment tax credit enacted in 1962 undoubtedly provided an additional stimulus to plant and equipment expenditures. At the same time, particularly the more generous depreciation allowances as well as the continued rise in profits helped to generate additional cash flows available for investment.

At least for the time being, it seems to be clear that Congress and the Administration have chosen to apply an expansionary fiscal policy as needed primarily through tax reduction rather than through accelerated increases in Federal spending, particularly on goods and services. Transfer payments to persons will continue to expand, particularly in the near future, as a result of liberalized social security payments and Medicare, and the trend in grants in aid to State and local governments is still strongly upward, but the tendency seems now to be toward reducing the Federal Government's share of the GNP, including the share that it diverts through cyclically sensitive income taxes. Continuation of this trend will weaken somewhat the effectiveness of the Government's automatic stabilizers and place increased responsibility on private spending and on the expenditures of State and local governments, both to maintain a satisfactory rate of growth and to avoid the sort of cyclical instability which private spending has been prone to in the past.

Now, finally, I come to the consumer. In the last Annual Report, the Council of Economic Advisors referred to the dependable consumer who could be counted on year in and year out to spend from 92 to 94 percent of his disposable income after taxes on goods and services. In this respect, consumers have been behaving in this upswing as they have behaved in previous postwar expansions, but a couple of differences are worth pointing out.

In the first place, consumers seem to have been even more dependable in this upswing than in the preceding expansions. Over the 16 calendar quarters beginning with the second quarter of 1961 and ending with the first quarter of 1965, consumer expenditures varied between only 92.0 and 93.4 percent of disposable income, or, turning this around the other way, the personal savings rate varied between 6.6 and 8 percent of disposable income. This range was somewhat wider both in 1954-57 and 1958-60.

Also, on the average, consumers have been saving a somewhat larger fraction of their disposable income in the current upswing, an average of about 7.3 percent since this expansion began, compared with averages of 7.0 and 6.9 percent of their disposable income during the two preceding upswings.

Interestingly, the rate of personal savings averaged just about the same both for the period from the second quarter of 1961 to the fourth quarter of 1963 (before the 1964 tax cut) and for the period from the first quarter of 1964 to the first quarter of 1965, which includes a full year's effect of the

tax cut as well as the effect of the automobile strikes in the last quarter of 1964 and the surge of pent-up demand for automobiles in the first quarter of 1965.

It should be noted, however, that there was a fairly steady decline in the savings rate during the first 2 years of the upswing. For about a year from the fourth quarter of 1962 through the third quarter of 1963, personal savings remained in the narrow range of between 6.6 and 6.8 percent of disposable income. The savings rate then moved to a higher level from the fourth quarter of 1963 through the year 1964. It then fell to 6.8 percent during the booming first quarter of 1965.

It remains to be seen whether it will rise again. It is not likely to fall much, if any, lower.

I have compiled some additional material for judging the effects of the 1964 tax cut, and this material also provides a perspective on the continuing boom in automobile sales. I have tried this experiment. I have divided the period since the beginning of 1962 into subperiods in order to average out some of the erratic fluctuations we get when we take quarter-to-quarter changes. I have then computed average disposable income after taxes and average expenditures for each of the major categories of consumer expenditures, including automobiles, for each of the following periods: each of the two halves of 1962 and of 1963, the first three quarters of 1964, and the fourth quarter of 1964 combined with the first quarter of 1965.

Combining the first three quarters of 1964 picks up most of the effect of the first installment of the tax cut, in particular the substantial reduction in payroll tax withholding. Combining the last two quarters--the fourth one of 1964 and the first one of 1965--permits us to allow for the effects of the automobile strikes. I then computed the ratio of change in consumer expenditures to the change in disposable income as derived from these subperiod averages I have just described.

The rise in consumer expenditures was greater than the rise in disposable income in the second half of 1962 and again in the first half of 1963. In this early part of the upswing, for a given dollar increase in disposable income, consumers were increasing their spending more than a dollar.

Relative to the continued rise in disposable income, the rate of expansion in consumer spending then tapered off after the first half of 1963. I have suggested that taking together the first three quarters of 1964 might help us to assess the effects of the tax cut on consumer spending. The rise in total expenditures relative to disposable income during this period--these three quarters--compared to the second half of 1963 was not much different than the ratio of increase in spending to increase in income which occurred during the preceding half year. It would appear that the accelerated rise in disposable income associated with the tax cut went particularly into consumer durables, especially automobiles, and interestingly also in nondurables, but the incremental ratio of spending to income fell off sharply in the case of services.

A further substantial rise in disposable income occurred in the next 6-month period, covering the fourth quarter of 1964 and the first quarter of 1965. The incremental ratio of consumption to disposable income also rose, from 0.85 in the first three quarters of 1964 to 0.91, but the incremental ratio fell off sharply in both durables and for automobiles, with more than offsetting increases for nondurables and services.

The decline in the incremental ratio for other durables was even sharper than for automobiles.

Can we say anything about the prospective relationship between consumer spending and disposable income in the months ahead? While prediction is no part of the purpose of this paper, a few further comments might help to put recent developments into perspective.

The relatively high savings rates from the fourth quarter of 1963 through the fourth quarter of 1964 suggest there may still be some pent-up demand and the savings rate may possibly remain below 7 percent for a while longer. The incremental ratio of total consumer spending to disposable income has shown rising tendencies since the beginning of 1964, but there is no assurance that this ratio will rise much further.

It would also appear that expenditures for services have been responding relatively sluggishly to the rise in income since the beginning of 1964, and a change toward a somewhat more rapid expansion may be in store here.

The dependable consumer, to use the Council's phrase, has indeed done a good job in helping support the current expansion, but he is by no means an automaton, responding in completely predictable fashion to every change in his after-tax income. His rate of personal saving has varied, and some of the changes in the patterns of his expenditures have been quite dramatic. It would appear that he is likely to continue to give strong support to expansion in the months ahead, and this will be particularly the case if he can be induced to keep his savings rate down below 7 percent.

I should like now to offer a few observations about some other characteristics of the current business expansion, particularly those aspects of the behavior of the economy that have contributed to the duration and the steadiness of the upswing.

Indeed, it can fairly be said that this has been a remarkable expansion in the degree to which various types of excesses and maladjustments have been avoided. We can begin with the behavior of prices, about which there has been much discussion.

As is generally known, wholesale prices have been remarkably steady, although there has been some inching up in recent months. The index of industrial materials prices was no higher in mid-1964 than at the beginning of the upswing, but there has been a significant rise in the last 9 months.

The rise in the consumer price index has been quite moderate, with as yet no clear tendency toward acceleration in the rate of increase, although some disturbing increases have occurred, particularly in food prices in the last couple of months.

Behavior of prices reflects in part the behavior of labor costs, which in turn depend on changes in hourly earnings and in labor productivity. Labor costs per dollar of real corporate GNP declined during 1961 as is typical in the early stages of recovery and have shown surprisingly little increase since then, much less than during the latter part of any previous postwar expansion.

Indeed, labor costs per unit of output in manufacturing have actually drifted downward since mid-1962, and this tendency toward decline was still apparent in the early months of 1965.

It finally needs to be added that the excess capacity carried over from the boom of the 1950's has contributed to the good behavior of prices and probably also to the continued rapid rise in labor productivity.

It has been typical of past cyclical expansions that eventually, as the boom continues, costs begin to encroach on prices and profit margins begin to fall. This happened in each of the postwar expansions preceding the present one. But it has not happened in the current upswing.

The ratio of price to unit labor costs in manufacturing was still rising in early 1965, and so was the ratio of profits to income originating in the corporate sector as a whole. The rise in total corporate profits after taxes accelerated in the latter half of 1963 and then, after a more or less horizontal movement during 1964, accelerated again in the first quarter of 1965.

Another feature of this expansion has been the close control of inventories and orders. Stock-sales ratios for manufacturing and trade have tended downward through the entire upswing, and at the end of 1964 were at their lowest level in 10 years. As the Department of Commerce has pointed out: "The downward drift in the ratio in 1963 and 1964 has been quite different from the increases during the advanced stages of previous upturns." 19/

There was a substantial increase in inventory investment in the fourth quarter of 1964 and the first quarter of 1965, but this was presumably temporary, associated with stockpiling in anticipation of the steel strike and restocking of cars after the automobile strike.

Not only private business but also the monetary authorities have behaved well. The rate of expansion in the money supply both excluding and including time deposits has been unusually steady. Despite concern over the balance of payments, the Federal Reserve authorities have carefully avoided putting

---

19/ Survey of Current Business, January 1965, p. 9.

monetary obstacles in the way of expansion. While Treasury bill rates have been forced up to minimize the outflow of short-term capital, long-term interest rates have held remarkably steady during the entire upswing. Indeed, corporate municipal bond yields as well as mortgage yields were generally no higher in the early months of 1965 than at the beginning of the upswing in 1961, and in some cases they were even a bit lower; this is a remarkable performance over a long and vigorous upswing.

Corresponding with this behavior of interest rates has been a steady advance in the volume of bank and nonbank credit. If we have failed to achieve full employment after 4 years of rising output and employment, the blame can hardly be put on the monetary authorities. This is in contrast to the monetary tightening that occurred in 1959-60.

I shall make no attempt to deal at length with the balance of payments problems that have beset the United States in recent years; except under the most skillful management, these difficulties can seriously interfere with the rate of domestic expansion that we need to get closer to the full employment goal. I shall limit my comments to the following points:

First, during the current expansion, exports have risen more rapidly than imports with a consequent improvement in our balance of trade on goods and services account. The improvement was particularly marked in 1964. Domestic expansion had not led to a deterioration in our balance of trade in goods and services. This good performance is due to the rapid expansion of our exports, which more than offset the increase in imports induced by the continued expansion in domestic output and spending.

The second point: The most important reason for this improvement in the merchandise trade balance is undoubtedly the improved competitive position of the United States resulting from the relative stability in the American price level combined with the continued rapid growth of our principal customers.

Third, given the need to continue governmental aid abroad at something like the present level, our balance of payments problems stem primarily from the large outflow of American capital. The outflow was particularly heavy in the fourth quarter of 1964.

Against this background and given the official assumption that the present gold value of the dollar must be preserved, the monetary and fiscal authorities have acted with skill and circumspection to achieve the twin goals of not interfering with domestic expansion while at the same time seeking to reduce the balance of payments deficit. The chief measures have been tie-in arrangements to direct the proceeds of foreign aid toward the purchase of American goods; the interest equalization tax passed in 1964; the new set of measures announced by the President in February 1965 primarily, but not exclusively, aimed at securing voluntary restraints on the outflow of capital; and the wage-price guideposts so far as they can be said to have had some effect in holding back the rise in wages and prices.

The answer to our balance of payments problem is not yet in sight, although it may be surmised that the deterioration in the latter part of 1964 was only temporary. Fundamentally and in the long run, assuming stable exchange rates at present levels, the answer must be found in two directions.

First, continued improvement in our competitive position, resulting from a less rapid rise in American than in foreign prices, and second, the development of more adequate sources of capital abroad.

We can also count on a steady increase in the income on American investments already made abroad, and, of course, we must maintain profitable opportunities for a steady expanding volume of domestic investment so that not too much American money will go abroad in the first place.

In the last Economic Report, the Council of Economic Advisors predicted that the GNP in 1965 would be within a $10 billion range centering on $660 billion. The figure of $660 billion was widely accepted both in and out of Washington as a reasonable forecast for this year's GNP. If prices rise this year at the same moderate rate as they did in 1964, this implies and increase in real GNP between 1964 and 1965 of about 4.1 percent. Potential output has now begun to grow at 4 percent or better, so the Council hardly did full justice to the problems still facing us when it said cautiously that: "The increase in output is likely to exceed the growth of potential, reducing the gap moderately." 20/

The reduction in the gap and in unemployment will be very moderate indeed.

GNP rose unusually rapidly in the first quarter of 1965. The rate of increase for the remainder of the year, will be much lower. Indeed, expansion in real GNP during the final three quarters of this year, at an annual rate of not much over 3 percent if prices continue to rise at their recent rate, would yield a GNP for all of 1965 of just about the predicted $660 billion. In other words, we can grow at an annual rate of 3 percent, maybe a little better than 3 percent, for the rest of the year and achieve the predicted annual figure of $660 billion.

The sharp rise in GNP in the first quarter of 1965 brought the seasonally adjusted unemployment rate for the first quarter down to about 4.8 percent. Unless the expansion in output for the rest of the year is more rapid than is now predicted, unemployment in the fourth quarter of 1965 will not be much lower than 4.8 percent.

This brings us back to the dilemma which I suggested at the beginning of this paper. We must run awfully fast these days just to stand still. Rapid growth at the rate of 4 percent or better per year is needed to prevent unemployment, open and disguised, from rising. Yet to expand still faster in the next several years, fast enough to bring the unemployment rate down to 4 percent or below, greatly increases the probability of accelerating price and

---

20/ Economic Report of the President, January 1965, p. 85.

wage inflation and eventually of another business recession. Constructive fiscal and monetary policies in the last 4 years have helped us to achieve substantial gains. Still further advance toward the goal of full employment while at the same time avoiding the conditions that might bring on another recession will be increasingly difficult from here on. It will call for much wisdom and imagination in Washington and for cooperation and constructive long-range planning by business and labor.

Annual Percentage Rates of Change in Components of GNP, in 1954 Prices, Selected Intervals, 1948-64

	1948-53	1953-57	1957-60	1960-64
Total GNP	4.71	2.58	2.49	4.05
Personal Consumption Expenditures	3.36	3.64	3.20	3.91
Durable goods	6.11	3.85	3.11	6.41
Nondurable goods	2.39	2.89	2.17	2.93
Services	3.76	4.57	4.58	4.13
Gross private domestic investment*	0.32	3.52	1.19	4.21
Residential nonfarm construction	3.59	2.99	5.96	4.01
Other construction	4.57	4.19	-0.61	2.09
Producers' durable equipment	-0.27	2.26	-2.64	6.13
Net exports of goods and services				
Exports	2.21	10.44	.68	7.29
Imports	6.21	4.46	4.04	5.46
Government purchases of goods and services	14.90	-2.72	1.91	3.84
Federal	20.76	-7.42	- .70	3.32
State and local	5.84	6.01	5.30	4.36

*Total gross investment includes net change in inventories, but percentage changes in the latter are not shown here separately.

MR. SAMUEL D. ARONS: Professor Gordon, would you comment on your appraisal of the effectiveness of the contribution that the various manpower programs in the Poverty Program have made in the recent period and what contribution you feel they will be making to the outlook for the next year or so.

PROFESSOR GORDON: You are all familiar with the old argument that has now been going on for a half dozen or more years between the so-called "structuralists" on the one hand, and the "deficient aggregate demand" people on the other. I, in one sense, have always labeled myself a "deficient-aggregate-demand person:" given enough demand for goods and services the jobs will be there, and the people will go to work. This is still my basic position.

But unlike a few of my extreme "deficient-aggregate-demand" friends, I have always felt there is a crucial place for manpower policy. The way I would like to put the structural unemployment problem and did put it in an article about a year and a half ago is that the problem is not that structural unemployment has gotten worse significantly but that we have always had it and it has always been a problem. We have always had high teenage unemployment rates, we have always had a disgraceful situation with respect to nonwhite unemployment rates, and unskilled common laborer rates have always been extremely high. In this sense, we have always desperately needed a manpower policy, and it has taken us over a century to develop one.

We are concerned to the extent that we can develop a manpower program that will make it easier to absorb particularly the new entrants into their first jobs, and to that extent we can expand aggregate demand a little more rapidly with less risk for inflation and accelerated price increases. A manpower policy won't remove the inflation problem, but it does help in holding back the amount of wage and price inflation that you get with a given rate of rapid increase in aggregate demand.

Now, on the Poverty Program, to the extent that it is in effect a random collection of little pieces of manpower programs--that's what a fair amount of it is--what I have said holds. Beyond that, I would like to go much further than the Congress has been so far willing to go. I would like to see a massive expenditure program directed toward some of our most urgent social needs and in which we could directly put to work many of the people it is going to be difficult to place even with an elaborate manpower program.

MR. HAROLD GOLDSTEIN: You did not seem to be very hopeful of a significant reduction in unemployment in the next few years. Assuming that we can employ effective manpower policies, assuming we can lick the inflation problem, how would you suggest that we move ahead toward a lower unemployment level? Do you think that further tax reductions beyond what is contemplated now may be a useful appraoch?

PROFESSOR GORDON: I start with the fact that from what we can make out about the prospective increase in the labor force and if present productivity trends continue, we are going to have to run fast just to stand still. Even Gardner Ackley in a recent speech said that it looks as if prospective growth in full employment potential will be better than 4 percent, and when I challenged Otto Eckstein with this last Monday he said, "Did he really say that?" It apparently got through without one of the staff taking a look at it.

To bring the unemployment rate down further, we have got to expand in real terms at the rate of something like 5 percent, and keep it up, not just this year but next year, 1967, and so on.

One of my problems is that I have spent a good part of my adult life studying something which an economics department and the business world would call "business cycles," and I do not think the business cycle is dead in the United States, although the European countries have done a pretty good job of practically attenuating it out of existence.

Unless the Government is prepared to go beyond anything I think Congress will accept, we are, during the next several years, going to rely uncomfortably heavily upon this boom in business plant and equipment expenditures, and it cannot last forever.

At the same time, the American people through the Congress seem to be making a basic policy decision, and that is to take any reductions we get in defense expenditures, to the extent the world situation permits, in the form of tax cuts rather than a substantial increase in nondefense expenditures.

As I said in my paper, we are moving back toward increased reliance on private spending by a tax-cut policy. The net effect of the tax cut is very stimulating, as was evidenced in 1964, but over the next 5- to 10-year period, it is going to be more and more necessary for private consumers, private business, and State and local governments to do two things: To expand total spending to increase jobs at the rate of better than 4 percent a year, or better than 5 percent if we are to move back to the 4-percent unemployment rate, and to avoid a recession.

I am all for American business, and it has learned a tremendous amount in the way of long-range planning, avoiding speculative excesses, and controlling its inventories, but I am not yet optimistic enough to believe that without powerful countervening action by the Federal Government, through the kinds of monetary-fiscal policies we have had in recent years, we can both maintain an adequate rate of employment and avoid recession. From this point of view, I am not as optimistic about the next few years as I would like to be.

I think it is going to be awfully tough to get down to that 4 percent figure. Here is where the manpower part comes in again. I think Gertrude Bancroft at our meeting in New York indicated that a 4 percent unemployment rate a decade ago, with the present composition of the labor force, means something like 4.2 percent today. If you take the structure of unemployment in 1956 and 1957 and adjust for the increased importance of the high unemployment groups--teenagers above all--this means that to be where we were in 1957 --or whenever we had 4 percent, we did not have quite 4 percent in 1957--we would have something like 4.2 percent today. There has been structural worsening, if you want to put it that way.

Here is certainly one crucially important role for manpower policy. Spending on manpower and poverty programs will generate jobs and also make the labor force more adaptable to the jobs that are already there.

MR. CHARLES A. PEARCE: Dr. Gordon, would you say anything about the influence of wages on employment? I understand this was discussed quite a bit at the conference you referred to a little while ago.

PROFESSOR GORDON: George Hildebrand and George Delehanty presented a very interesting paper at the conference, reporting on what is to be a longer range project. It is clear that Hildebrand believes that wage levels and wage differentials do affect the level and pattern of unemployment, and this is my view, also.

I came out in the conference and said flatly that I was in favor of whatever it is called, a differential or multiple minimum wage law, not a single minimum wage but one geared to the difficulties we have in getting new entrants into the labor force. I do not think it is realistic politically to talk about reducing the present minimum wage for certain disadvantaged groups. But in further increases in the minimum wage that will almost certainly take place, I would like to see the present rate continued, let us say, for teenagers or certain types of new entrants or other particularly disadvantaged groups.

I think the kind of minimum wage law we have does affect our ability to absorb new entrants into the labor force and the ability of those who lose jobs because of obsolescence of skills to get rehired. Just a personal anecdote--I have had a little experience with our local high school in Berkeley in recent months, trying to find jobs for underprivileged kids both while in school and when they graduate from school, and we keep running up against that minimum wage. Our employer community in Berkeley is a pretty enlightened one; we have got a good deal of cooperation from them; we have something we call a work-creation program which they contribute mone to; they are making jobs available as part of the summer employment program. But, in terms of taking a good many of these boys and girls on at marginal types of jobs which the employer would almost create for the purpose, which would not hurt their pocketbook too much, what the boys and girls would be willing to do at $1.00 an hour, they are not willing to do at a $1.25 or $1.40 an hour.

I think there are other problems. There is no question in my mind that certain unions have seriously hurt employment opportunities in their trades in this country. I am not going to fight with them about the wages they can extract from the labor area but, for instance, an awful lot of amateur plumbing and electrical work is done around the house these days which, at a lower or differential rate, would certainly get done with employed labor.

While I cannot undertake to report in detail on everything that Hildebrand and Delehanty said in their paper, they do say that in the preliminary statistical work they have done there is some evidence that wage differentials have affected employment, and there were a fair number of people at the conference who felt--not everybody, but some--that we should be more discriminating in the way we apply our minimum wage regulations.

MR. PEARCE: Would you care to comment on the proposal to increase the overtime rate?

PROFESSOR GORDON: I have always thought of myself as a liberal, But as a professional economist, I have a good deal of respect for the play of market forces; I always want to stop and think before we start tinkering with prices any more than we already do. Where we fix overtime rates is a part of that tinkering with labor and the price of labor. On the whole--without having thought the matter all the way through--I find myself opposed to further increases in the differential. I do not think that I would enjoy starting an argument on that subject this morning because I have to confess I have not thought through my own position in a great deal of detail.

Something that came up in casual conversation this past week made me think about the possible desirability of taking a look at our differentials on second and third shifts and of asking what are the possibilities of getting more people into more jobs by having rates that would make second shifts more attractive--relative to overtime on the first shift--to both workers and employers. Again, that is something that I have not thought through.

While, generally, American industry is not working at overcapacity levels, we are beginning to hear scattered reports of plants that cannot expand output --and thus employment--any further without putting in more work stations. They go as far as they can with overtime on one shift, but it is a one-shift operation. To the extent that workers are more willing to take second shifts and to the extent that the overhead is not too high for employers to go ahead with it, we might be able, as we expand demand, to get some more elasticity in the system through wage differentials that encourage the use of second shifts.

Again, I am speaking off the top of my head in an area in which I am no expert.

FROM THE FLOOR: You mentioned here the matter of a tendency toward reduction of the Federal share of GNP. Would you care to speculate or consider what might be the future potential of the State and local share of GNP growth given the trends that are now in process like reapportionment, possibly an urban Cabinet post, and so on, with more urban problems involved?

PROFESSOR GORDON: I mentioned briefly in my paper that the trend in transfer payments from Federal Government to the States is still markedly upward, and this is likely to continue.

As most of you probably know, there were a set of task forces at work on national policy at the time of the election, the idea being that the recommendations that came in from these task forces would help to shape the legislative program that the President submitted to Congress.

At the time of last year's election and the months immediately before, Walter Heller had begun talking privately about using some part of the prospective tax cuts that were ahead of us for remission to the States instead of turning it back to the taxpayer directly and then having the taxpayer spend it.

The Federal Government would collect it and then on the basis of some formula pass on what the Federal Government did not need to the State and local governments, presumably through the States.

A major problem facing State and local governments is the relative income inelasticity of their major sources of tax revenue. They do not rely anywhere nearly as heavily on the income tax as does the Federal Government. The Federal Government has largely preempted that major source of revenue, although many States do have a moderate but not highly progressive income tax and some sort of corporate income tax.

To me, a major constructive fiscal program could be laid out whereby as income continues to rise, Federal tax revenues would be permitted to rise more than in proportion because of their progressiveness. We would then lay out a program in which some part of this increase would be remitted directly to the States according to some reasonably fair formula.

Now, I gather that part of the problem is getting an agreed formula. The States that pay most--States like New York, Pennsylvania, and California--pay a lot of income taxes, and when there is going to be a remission to the States, they want to get their slice back. On the other hand, where the money could do some of the most good is in some of the States that pay relatively little income taxes to the Federal Government. How are you going to lay down conditions? What kinds of formulae would be used? It is going to make this a very difficult thing to work out, but I think, in the long run, we have got to come to it. If we do come to it, this then meets part of my problem. I see two problems in that dimension. One is this fact: To put it bluntly, one reason the European countries have done so much better than we have from the point of view of growth and stability is that the Government plays a more important role in the economy.

The second thing is this business of the automatic stabilizers. We have several automatic stabilizers in this country, of which unemployment insurance is one. When unemployment goes up, so do unemployment insurance payments; people have money automatically from that source, an offset to the decline in their wage income, and spending stays up in part.

Two other powerful automatic stabilizers are, first, corporate undistributed profits. When profits go down when business goes down, dividends stay up at least for a few years and, therefore, dividend receivers have a relatively small decline in their incomes and spending stays up.

Then the other is the personal income tax. Because it is so progressive, when our income before taxes goes down, our income after taxes goes down much less; the Government takes it on the chin relatively more than we do; hence, the huge Federal deficits we get in recessions.

Now, to the extent that we cut back on Government spending relative to total GNP and cut back on the personal income tax, to that extent we are removing that automatic stabilizer.

MR. WALTER PESTKE: There has been some discussion of the fact that one of the problems in the unemployment rate is the lack of knowledge about the availability of jobs, and I think many of the agencies here have been involved in trying to identify the unfilled vacancies and the like. Do you believe this is going to have some effect in reducing this unemployment rate?

PROFESSOR GORDON: We have got a whole chapter in the so-called "Gordon Committee Report" on the desperate need for job vacancy data, and we do not have them yet, as you all know. There is a test survey going on in the Bureau of Employment Security right now through the State employment offices, experimenting with what we can get. As you probably also know, the request for a substantial appropriation to enlarge on this has been turned down by the House Appropriations Committee.

In the meantime, there is widespread interest in the need for vacancy data. You probably also know that the National Industrial Conference Board has a grant from the Ford Foundation to carry on a test survey of the willingness of employers and ability of employers to supply vacancy information. The sample city is Rochester, and they are getting an extremely good response from employers. They have conducted a survey twice now; the results on the first are out, and they are just tabulating the second. The response rate on the first was, I think, something like 95 percent from employers; it was almost that good on the second.

There was a job vacancy conference in New York a few months ago. Interestingly, I suppose the organized group which is the most strongly opposed to the collection of vacancy data is the AFL-CIO. You have to fight with them in part in order to get Congress and those that are sympathetic toward labor to be more favorably disposed to spending large sums of money on vacancy data, but you are not going to get any fight from me on the need for it.

MR. CHARLES A. ROUMASSET: I would like to ask Dr. Gordon to expand on the suggestion or reference he tossed out on the manpower implications in a shift from consumer durables into services.

PROFESSOR GORDON: There are two aspects of that I had in mind. You all know how worried we were at the beginning of this upswing about the supposed deterioration in the blue-collar worker situation and in that of semiskilled operators. As my wife pointed out in the paper she gave at this conference in New York--and most of this information is already familiar--there has been a very encouraging improvement in that situation and a very rapid rise in employment in the blue-collar categories and particularly among semiskilled operatives, although the unskilled common laborer still is in fairly bad shape.

Unquestionably, the tremendous rise in durables, both plant and equipment, and the rise in consumer durables have been responsible for this. To the extent that we are now going to have to look forward to a shift in the composition of spending, let us say, away from consumer durables toward the nondurables and the services, this will change the pattern of employment and job opportunities. You can think of it in two ways.

We keep saying that productivity increases in the service industries are less than in the goods industries and particularly in durables; therefore, presumably, a dollar increase spending in the services will create more jobs

than a dollar increase on automobiles or other durables. So from that point of view, a change in pattern toward services might help the overall employment situation. But it also raises questions as to whether if there is going to be some flattening out or even cutback on the durable goods side, whether the people who will be released from jobs or will now not find jobs in the durable goods industries will be able to move over into the service industries where the jobs are. This kind of structural problem, of course, is one that we have been worrying about and is partly responsible for the efforts now being made through the Manpower Program.

MRS. DOROTHY K. NEWMAN: You spoke of the importance of capital expenditures in the whole picture. In recent years, government policy and programs have been buttressing the private business sector. What do you recommend for private residential building in the way of public policy?

PROFESSOR GORDON: I have a hunch--and this seems to be the view of a fair number of experts--that we are in for no rise and possibly a modest decline in private residential construction for 2 or 3 years. We are at a particular demographic stage where the baby boom of the war and immediate postwar years is generating an awful lot of people just coming into the job market, giving us our teenage unemployment problem. They are beginning to get married, but as they get married, their first demand is for a small flat or apartment and for consumer durables in the way of equipment for the kitchen and furniture and what not.

It is assumed that these demographic factors will not generate a new, big upsurge in single family dwelling demand until the very end of the 1960's. In the meantime, there is evidence--at least in some areas--that there has been overbuilding in multifamily dwellings, apartment houses, and there have been some cutbacks here and there.

Data from the Department of Commerce on spending on residential construction, if I recall them, showed a decline from the fourth quarter of 1963 through the fourth quarter of 1964 and then rose again in the first quarter of 1965. Somebody--was it Harold Goldstein?--said that you need at least two quarters or 2 months to make a trend, and we only have one here. I do not expect any serious decline, but I do not expect any boost to the economy from a substantial expansion in residential building for, say, the next 2 or 3 years. That puts that much more emphasis on government spending and private business spending if we are to get expansion.

MISS DOROTHY BARROW: Do you think the total program for education and the subsequent rise in taxes on households throughout the United States may be having a tendency to depress residential building? In other words, are we moving into rental areas rather than maintaining our thinking about buying a home as a result of this increase in taxes?

PROFESSOR GORDON: Well, you started out, if I recall, by referring to Federal aid to education, did you not?

MISS BARROW: Yes.

PROFESSOR GORDON: Well, I think that is one of the most important things that has happened in the last year, the final break-through of this log-jam on making Federal financial aid available below the college level to local school districts. Now, to the extent that this will be followed by more money from the same source in the same direction, it is going to ease the tax burden on the local school districts because they can look forward to more Federal aid; they can go ahead with the improvements in education that are called for and not have to stick the property holder with as rapid a rise in property tax rates as would otherwise occur. Certainly, this is a problem which I suppose every school district in the United States has, the enormously increased number of children, the rising standards of education, the recognition that we have got to do a wide variety of things, particularly for children from underprivileged families and neighborhoods which we had not even begun to think adequately about 10 or 20 years ago.

This is going to cost a frightful amount of money. We are still far from catching up with the cumulative needs for new school buildings. Again, to get personal for a moment, I have gotten to know moderately well the new Superintendent of Schools, Neil Sullivan, whom we were fortunate enough to attract to Berkeley this past year. I have talked to him a good deal about Berkeley school needs. Now, we think Berkeley is somewhat of a superior city; our schools are supposed to be very good and even upper middle-class families send their kids to the public grammar schools and high schools and then they go on from there to the best colleges in the country. There is not the same feeling of need here for private prep schools that you get in the East; at least in the Northeast, we think we are pretty good. But, when he got through going over an inventory of just the physical state in which some of our schools in the less-privileged parts of town were in, I was horrified. Had we been letting this go on?

We have had the usual experience. We have had one big school bond issue turned down recently, we had to work hard to get another one through, and it is not halfway near enough. For us, chiefly, the property tax and some miscellaneous sources of revenue are what we have got to finance our schools with, plus an occasional bond issue, which the voters are very reluctant to approve.

I am sure there are some people here who are already concerned about the encroachment of the Federal Government on the traditional provinces of the State and local governments, but I must confess that my diagnosis is that these needs in the long run can be met only through Federal aid to the State and local governments. This is why I am particularly anxious to see an agreement reached between the Congress and the State and local governments that will call for a regular part of our tax system, a certain part of the Federal income tax, going back to the States and local governments.

MR. JOHN W. LEHMAN: We have heard, Professor Gordon, several times during this conference that one of the main reasons for turning to the tax cut rather than something else was the disenchantment of the economists with expenditures as a device for stimulating the economy. Is there some middle ground here that you are suggesting or some combination and, if so, would you elaborate on that please?

PROFESSOR GORDON: There is an interesting history to this. When the Keynesian revolution first occurred in the middle of the 1930's, beginning in this country with Alvin Hansen and the younger economists of that generation who are now in our Council of Economic Advisors and senior professors in our universities, the emphasis was heavily on Government spending as the way to use fiscal policy. In a recession, you would increase government spending as fast as you could, and we talked and debated and wrote about public works and that type of thing. In the last 10 years, the emphasis has shifted very heavily to doing it through tax changes.

There are two different issues involved here. There is one, the short-run flexibility issue, and then the other is the longer run question as to whether you want--or how much you want--the Government in the picture. So far as the short-run flexibility issue is concerned, I think most of us are agreed that tax changes take effect faster than proposed spending changes, particularly in a recession. Even having to argue something through Congress, once you do, the tax cut can be effective in terms of reduced payroll withholdings in 2 weeks, or in something of that order. But to get a large increase in Government spending going takes a longer period of time. Even after Congress approves it, there is a matter of getting specifications worked out; there is a matter of giving the contracts; getting the initial ground-breaking work done; and it is often said that you will get the bulk of the expenditure just when you do not need it. There is a good deal to this.

Some people have done a fair amount of work on the types of Government spending that can be increased and decreased relatively quickly, and there are categories of these things. A big hydroelectric dam is the kind you do not want if you want to do something quickly and shut it off quickly. Some road repair work or resurfacing an airport, these are things that you can do very fast.

I am more concerned with the long-run issue here; that is, I think that we will be playing dangerously with the chances of retaining rapid growth and stability in this country if we significantly cut back the fiscal role of the Federal Government, and cutting taxes is cutting back that role. I like to have a larger after-tax income so that I can make my own decisions about spending, also, but I think--and I am not arguing necessarily that the Federal Government should spend the money--I am asking that it keep its tax revenues up and work out a partnership with the State and local governments on joint expenditures of this money on a stable basis, rising with the rise in GNP and in the full employment potential over the long run.

APPENDIX

DELEGATES TO TWENTY-THIRD INTERSTATE CONFERENCE ON LABOR STATISTICS

ALABAMA

Gartman, Ethelyn M., Chief, Research and Statistics, Alabama Department of Industrial Relations

ARKANSAS

Bennett, Alva M., Statistician, Arkansas Department of Labor

Westerlund, Barton A., Associate Director of Industrial Research and Extension Center and Professor of Business Administration, University of Arkansas

ARIZONA

Stewart, Lawrence H.; Workmen, Arthur D.
Mathematics and Science Competencies for Technicians, a Study of the Training of Electronics and Chemical Technicians With Special Emphasis on Critical Mathematics and Science Requirements. Bulletin, Vol. 29, No. 12.

California State Dept. of Education, Sacramento
MF AVAILABLE IN VT-ERIC SET.
Pub Date - Dec60 58p.

*JOB SKILLS; MATHEMATICS; *PHYSICAL SCIENCES; *CRITICAL INCIDENTS METHOD; QUESTIONNAIRES; CURRICULUM PLANNING; *CHEMICAL TECHNICIANS; *ELECTRONIC TECHNICIANS
CALIFORNIA

The objectives of this project were to demonstrate the usefulness of the critical incident technique for identifying mathematical and scientific skills essential to the electronics and chemical technicians' job performance and to explore problem areas for leads to more productive research and curriculum planning. Data were gathered from supervisors' reports, technicians' reports, questionnaires covering training and work experience, hiring specifications, interviews with personnel officers, questionnaires from and interviews with junior college instructors, and printed instructional materials. A total of 278 technicians and 94 supervisors from the San Francisco Bay Area were involved in the study. Due to the limited number of critical incidents reported and the elementary skills involved in job performance, high level mathematics and scientific skills did not seem essential for satisfactory performance. It appeared that hiring practices are established to use such skill requirements as a screening device rather than as an actual job requirement. Differentiation between required and desirable skills would help dispel confusion in curriculum planning. It was recommended that the critical incident technique be limited to individual or small group interviews rather than questionnaires in order to clarify and simplify response making. Samples of critical incidents as they relate to job performance are included. (EM)

FOREWORD

The California State Department of Education has consistently encouraged as an essential prelude to sound curriculum planning and development the conduct of careful research and study. It is considered equally important that such study findings and conclusions be made available to those actively concerned in the improvement of California public school education.

The development of Technical Education curriculums in California is dependent upon the identification of the mathematics and science competencies needed in the occupation or cluster of occupations for which training is offered. In the spring of 1958, in co-operation with the University of California, Berkeley, this research project was begun. It was completed in early 1960. This study was made possible through Title VIII of the National Defense Education Act of 1958 Funds in the interest of providing highly skilled technicians for the national work force.

The material included in this bulletin reports the findings and conclusions of the authors as a result of the study. It is hoped that the information reported will be of help to those responsible for planning programs of Technical Education in California Public Schools.

Roy E. Simpson

Superintendent of Public Instruction

PREFACE

Industry's growing demand for personnel reasonably skilled in the many diverse and highly specialized aspects of applied technical knowledge has directed the attention of educators to certain obstacles in the way of more adequately designed pre-employment training programs. The question of how best to proceed in the face of these obstacles has been the object of considerable study and some areas of agreement have been reached.

It has been rather firmly established, for instance, that skills derived from the two broad fields of applied science and mathematics are the technician's most useful "stock-in-trade," and that junior colleges can adequately provide this required education and training.

Unanimity of opinion was not evident in attempts to explicitly define these skills, nor was the extent to which they are actually applied by industry in terms of equivalent training. Further advances in this area, as the author points out, are dependent upon a greatly expanded, carefully directed Technical Education Research Program.

The development of Technical Education curriculums in the junior college designed to adequately prepare the technician in the application of these skills, within limits normally essential to industry, must rely upon the acquisition of valid, to-the-point information. Among the best qualified and practical sources, obviously, are the working technician and his supervisor.

With the principal information sources thus generally identified, this study was undertaken to test, primarily, the Critical Incident Technique for providing data properly descriptive of those skills evidenced as critical to the technician's job performance in the electronics and chemical industries.

The strong points, weaknesses, and limitations of this technique, as demonstrated under the conditions of its employment, are objectively reported and discussed in the study report. The report also contains an analysis of data selected to portray the technician in terms of his most widely shared characteristics.

The conclusions and indicated trends presented herein strongly imply the advisability for re-appraising certain continuing practices and commonly held concepts, particularly in respect to trainee selection methods and practical levels of training. The contents of this report appear both meaningful and illuminating to any future exploratory effort directed toward better Technical Education curriculum planning.

A large measure of appreciation certainly is due the many whose assistance, both direct and indirect, has contributed so effectively to the development and publication of this report.

The ideas of a large number of persons have been incorporated into this report. Certainly the participation of the technicians, supervisors, and junior college instructors in both the electronics and chemical fields is gratefully acknowledged. It is impossible, however, to recognize, individually, all contributions. Acknowledgment can be made only to those who had major responsibility in this project.

The following companies and their representatives granted permission to interview technicians and supervisors and, in many instances, actually collected the questionnare data:

Aerojet General Corporation, Sacramento, California; Harlan Andrews
Alameda Naval Air Station, Alameda, California; Roy Hutchinson
Ampex Corporation, Redwood City, California; Theodore Picard
California Research Corporation, Richmond, California; Emory Hughes
Cutter Laboratories, Inc., Berkeley, California; Arthur Hershey
Dalmo Victor Company, San Carlos, California; Walt Englert
Dow Chemical Company, Pittsburg, California; Asa Maylott
Dymec Division, Hewlett-Packard Company, Palo Alto, California; Robert Grimm
Fairchild Semi-Conductor Corporation, Palo Alto, California; Gordon Moore
Hewlett-Packard Company, Palo Alto, California; Ray Wilbur
San Francisco Naval Shipyard, Hunter's Point, San Francisco; W. F. Reid
International Brotherhood of Electrical Workers, San Francisco; Wally Barrett
Kaiser Aluminum and Chemical Corporation, Permanente, California; Fred Lawson, E. A. Worthington, E. McMaster, Bert Altmann
Lenkurt Electric Company, San Carlos, California; Merrill Shattuck
Lockheed Aircraft Corporation, Sunnyvale, California; Jeff Lyons
Philco Corporation, Palo Alto, California; Larry Henninger
Radiation Laboratory, University of California, Berkeley, California; Albert Hand
Standard Oil Company of California, Richmond, California; Ralph Vollmar
Stauffer Chemical Company, Richmond, California; Arthur Hagg
Sylvania Electric Products, Inc., Mountain View, California; Brad Leonard
Varian Associates, Palo Alto, California; Bloyd Langsev

Stanley Boydston, Contra Costa College, and William Huberick, Oakland College, helped classify the critical incidents. The staffs of the Bureau of Industrial Education, California State Department of Education, and the office of the Division of Vocational Education located on the Los Angeles and Berkeley campuses of the University of California provided valuable industrial contacts.

Chapter I

THE PROBLEM

The scientific and technological developments of the past decade and the advent of the space age have necessitated some rapid industrial changes. New industries appear to spring up overnight, and establishments that have been in operation for many years are finding it necessary to change to new types of endeavors. Even those industries that are not directly competing in the development and production of new products growing out of the numerous scientific advancements are finding it necessary to install and use many new and very complex instruments requiring skilled operating personnel.

These rapid industrial changes have resulted in unprecedented manpower shortages, especially in the fields of science. One of the crucial shortages has been that of trained technicians who would provide services in the applied aspects of science. Some technicians are needed to work in research on the development of new products; others, in the actual production of new products; and still others, in the maintenance and operation of these products, especially those of recent development in the electronics field.

It would appear safe to assume that, should current expansion trends continue at the present rate, the supply of trained technicians will become quite inadequate. Already there is intensive competition within industry for the currently available supply. Even now, some apparently marginally qualified persons are being employed in technical jobs normally reserved for better-trained personnel.

Industry presently is recruiting technicians from many sources. Most of these technicians have received their formal training in secondary schools and junior colleges. The secondary schooling for many of these technicians has been supplemented by specialized training obtained during military service; this is particularly true for those in the electronics field. Although only a comparatively small number of industrial employees developed the skills required of electronics technicians by means of on-the-job training, this type of training is, at the present time, an important means of training industrial personnel to become chemical technicians. Former college engineering students who left school before they completed their programs and received their degrees are also potential candidates for work as technicians.

Certain problems may exist by virtue of the technician's highly specialized work and the varied sources from which he is recruited. It would appear that recruiting technicians from such widely differing training sources would necessitate, for certain groups, either costly programs of on-the-job training, tailoring the job for each individual, or both. Also, it is quite possible that technician job requirements are specialized to such a degree that there are but a limited number of skills that all individuals need and use in their work even though they all work in one field, such as that of electronics. Present research is inadequate to determine whether or not this is actually the case.

It is generally conceded that the training of technical manpower is an important functional responsibility of our educational institutions. There is no doubt that the accelerating need for technicians in many fields will result and is already resulting in demands on schools and colleges, particularly the junior colleges, to increase their offerings in technical education. It was recently estimated that there is a need for three technicians for each graduate engineer.[1] Of course, the number would vary according to the specific area under consideration. However, reports indicate that schools are graduating engineers at a ratio of two for each technician.[2] This imbalance has necessitated the use of engineering talent to carry out many functions which could be performed quite adequately by technicians—clearly a misuse of our highly trained manpower. Situations such as this have led to the observation that shortages in the supply of technicians are more serious than those reported to prevail among engineers.[3]

If the increasing need for technicians is to be met, what type of training must be offered? From all appearances, curriculums in the past have, like traditional course work in adjoining technical fields, simply *grown*—in most instances to meet the particular demands of a single plant or community. Obviously, more enlightened planning is needed to bring about significant improvement in training effectiveness.

There appear to be few guidelines to assist in the development of technical curriculums. Research on the topic is almost nonexistent. While there are ample opinions concerning appropriate general curriculum areas, these opinions are not sufficiently specific to be of great use.[4] There is fairly unanimous agreement, for example, that techni-

cians should receive firm grounding in mathematics and science. The specific mathematics and science skills to be included or stressed, however, have not been indicated. Before meaningful guidelines for curriculum building can be developed or before the validity of existing guidelines can be established, a great deal of research must be devoted to the type of training required to perform the work of a technician.

The problem explored in this study is one of determining how the mathematics and science competencies needed by electronics and chemical technicians can be identified and of developing ways in which the necessary provisions for developing the required competencies can be made in the curriculums of training programs. The study project, then, has two main objectives: (1) to demonstrate probable usefulness of a particular approach—that of the critical incident technique—for identifying critical mathematical and scientific skills essential to the technician in the performance of his job; and (2) to explore problem areas for significant leads to more productive research and curriculum planning. Implications of the findings for technical training are indicated at appropriate points in this report.

Originally this study was concerned with the critical mathematics and science requirements for two groups of technicians—electronics and chemical. In the course of the study, however, several other factors were observed to be generally pertinent to the training and utilization of these two groups of technicians and possibly of significance to other types of technicians. These observations are presented and discussed throughout the report.

The exploratory nature of this study should be emphasized at this point. The lack of previous research in the area with which the study was concerned necessitated the use of a variety of approaches. Moreover, the lack of information concerning such essential data as who the technician is, where he works, what he does, and so forth, has made it impossible to devise really adequate sampling procedures for a more definitive study. This project, however, will have served its purpose well if it should stimulate interest in research for data more aptly descriptive of the technician, his personal characteristics, and his on-the-job requirements; and if it should assist in developing more effective designs for future studies in this area. In any event, the study has uncovered and pinpointed many problems in the development of training curriculums for technicians.
